Hug, Johann Leonhard, a learned Catholic scholar and divine, was born at Constance, 1st June 1765, and educated at the University of Freiburg. He studied also in France and Italy. Consecrated a priest in 1789, he was called to be professor at Freiburg in 1791, and there he laboured till his death, 11th March 1846. His principal work, *Einleitung in die Schriften des Neuen Testaments* (Stutt. 1808, 4th ed. 1847), which was soon translated into French and English, was conservative in its views. He is also known by his work on *Die Erfindung der Buchstabenschrift* (1801), and by his *Gutachten über das Leben Jesu von D. F. Strauss* (Freib. 1840–44).

Hughes, Thomas, author and social economist, son of the late John Hughes, Esq., of Donnington Priory, was born October 20, 1823, and educated at Rugby and Oxford. He graduated in 1845, and was called to the bar in 1848. He published *Tom Brown's Schooldays* in 1856, the best story of schoolboy life in English literature. It has made Rugby known and loved throughout Britain and America. Among his other works are *The Scouring of the White Horse* (1858), *Tom Brown at Oxford* (1861), *Religio Laici* (1862), *Alfred the Great* (1869), and *Memoirs of a Brother* (1873). Mr. Hughes sat as a Liberal in Parliament for Lambeth 1865–68, and for Frome 1868–74. He is an authority upon social questions, and, as a warm friend to the working classes, has been a successful mediator in strikes and trade disputes. A disciple and friend of the late Frederick Maurice, his opinions are purified and impassioned by warm Christian feeling.

Hugo, Victor Marie, Vicomte, was born at Besançon, February 26, 1802. His father, General H., was a devoted supporter of Napoleon, and H.'s early years were spent partly in France, partly in Italy and Spain, where the General held various posts. On the fall of Napoleon his father and mother separated, and H. was placed in the École Polytechnique to prepare for a military career. During the years 1819–22 he gained three prizes at the Floral Games of Toulouse, and in 1822 he became famous by the publication of the first volume of his *Odes et Balades.* He now married Mlle. Foucher, who had previously refused him on the ground of his poverty. His next works, two prose pieces, *Hans d'Islande* (1823), and *Bug-Jargal* (1825), first showed the bold, antithetic, and at times spasmodic, manner characteristic of H. *Les Orientales* (1828), passionate odes, were eagerly welcomed; and in 1829 the production of his drama *Hernani* led to a fierce contest between the Classicists and H.'s friends the Romanticists, in which the latter were victorious. In 1845 Louis Philippe made H. a peer of France, and in 1848 the Parisians elected him both to the Legislative and Constituent Assemblies. About this time he became a Red Republican in politics, and in 1852 was banished from France by Napoleon III., whom he shortly afterwards assailed in a stinging brochure, *Napoleon le Petit.* He lived mainly at Jersey and Guernsey from 1852 until the fall of the Empire, when he was returned to the National Assembly at Bordeaux, but soon resigned, and after being driven from Brussels for his sympathy with the Commune, returned to Paris in 1871. Besides those already mentioned, H.'s works include *Notre Dame de Paris,* his first great novel (1831); *Les Chants des Crépuscule* (1835); *Les Voix Intérieures* (1837); *Les Rayons et les Ombres* (1840); *Châtiments* (1853); *Contemplations* (1856); *Le Légende des Siècles,* his grandest poem (1859 and 1877); *Les Miserables,* one of the best modern works of fiction (1862); *Les Travailleurs de la Mer* (1866); *L'Homme qui rit* (1869); and *Quatre-vingt-treize* (1874). H. is the greatest of French poets and novelists. He possesses a superb imaginative gift, and excels in vivid dramatic power, in analysis of character, in the presentation of intense emotion, and in descriptions of nature full of sombre, mysterious grandeur. He has wrought a wonderful reform in French poetry, banishing the old cramping rules, and imbuing it with new strength and sweetness. His poems contain lyrics of exquisite loveliness, though they are sometimes marred by over-audacious fancies and flaming colour. His marvellous fictions are also far too dithyrambic in style, and are weakened by undue aiming at effect.—**Charles Victor H.,** son of the preceding, born 2d November 1826, is an author and politician of some note; his brother, **François Victor H.,** born 22d October 1828, is favourably known to Englishmen by his translation of Shakespeare into French, in 13 vols (1860–64).

Hu'guenots, the name by which those who accepted the Reformed faith in France became generally known in the 16th c. There has been much doubtful speculation as to the origin of the name. Professor Mahn enumerates fifteen derivations, and himself inclines to that which associates the name with Hugues, an obscure heretic. With more probability the name has been derived from the German *Eidgenossen,* 'confederates' (by the French pronounced *Higuenos*), or from *Huc Nos,* the opening words of one of the earliest public documents of the H. See French Protestant Chuch.

Huile de Cade, obtained by the dry distillation of the wood of *Juniperus oxycedrus,* is almost entirely manufactured in France, and is chiefly employed, externally, in veterinary medicine, but occasionally on the human subject in obstinate skin diseases.

Hul'da, or **Hol'da** ('the friendly'), the old German goddess of marriage, the guardian of domestic life, and patroness of agriculture. She figures greatly in legend, and formerly the phrase, 'Hulda is making her bed,' was applied to the falling snow.

Hulk (Old Eng. *hulce,* 'a ship'), the body of a ship, especially if applied to an old unseaworthy vessel. The *hulks* are old ships formerly used as prisons. A *sheer-H.* is an old ship fitted up with machinery for fixing or removing a ship's masts.

Hull (Old Eng. *hule,* 'the shell or crust'), the body of a vessel, exclusive of the masts and rigging. *H. down* is said of a ship when her H. is beneath the horizon.

Hull, or **Kingston-on-Hull,** a thriving port of England, in the E. Riding of Yorkshire, is situated on a low plain at the entrance of the Hull into the Humber, 20 miles from the mouth of the latter, 53 E.S.E. of York, and 145 N. of London by rail. It has a rich Gothic church of the Holy Trinity, with a transept supposed to be the oldest brick building in England; a town-hall (1866) in the Italian style, faced with Streatly and Portland stone, and having a tower 135 feet high, and shafts of red Mansfield stone; a grammar-school, founded by Bishop Alcock in 1486; the Trinity House, an hospital for decayed sailors, to which is attached a nautical school; the Charter House, founded in 1384; Lister's Hospital, established by Sir J. Lister in 1642, a new theatre, &c. One of the chief ports for the trade with Germany and the Baltic, it receives in exchange for the cloths and yarns of York and Lancashire large quantities of grain, cattle, timber, wool, flax, hemp, rape, linseed, tallow, potatoes, &c. The docks, which are provided with railway lines, steam-cranes, &c., cover an area of over 100 acres. The Royal Albert Dock was opened by the Prince of Wales, July 21, 1869.

There entered the port (1875) 4631 vessels of 1,615,956 tons, and cleared 4355, of 1,454,642 tons. H. is a principal station for the Continental steam-packets, and sends two members to Parliament. Pop. (1871) 123,408. The town was purchased from the monastery of Melsa by Edward I., who changed its name from *Myton Wyk* to *Kyngestown-super-Hull*, gave it a charter, and constructed its harbour. Fortified by Edward II. in 1322, it was the first place to resist the authority of Charles I. on the outbreak of the Civil War. A great fire (damage, £100,000) occurred on the 15th August 1864.

Hull'ah, John P., musical composer and teacher, was born at Worcester in 1812. He studied theory under W. Horsley, and singing under Cruvelli (1829-35). H. has exerted himself in spreading the knowledge of music among the middle classes by the system which bears his name. From 1844 to 1874 he was Professor of Vocal Music at King's College, London, and in 1876 the degree of LL.D. was conferred upon him by the University of Edinburgh. Among his works are *History of Modern Music* (1862-75), and *Lectures on the Transition Period of Musical History* (1865-76).

Hul'sean Lectures, a course of from four to six sermons preached annually at Cambridge by a lecturer appointed in accordance with the will of the Rev. John Hulse of Elworth in Cheshire, who was born at Middlewich in 1708, and died 14th December 1790. On the same foundation are two scholarships in St. John's College, Cambridge, where Hulse was educated, the Hulsean Prize and the Hulsean Professorship of Divinity, the latter being substituted by an Order in Council in 1860 for the office of Christian advocate, instituted by the will of the founder, a portentous document extending to 400 pages folio.

Hu'manism and **Hu'manists.** Humanism was the form of culture that, after the restoration of Greek and Latin learning between the 14th and 16th centuries—especially after the taking of Constantinople in 1453, which sent Greek scholars to Italy—found its only models of thought and expression in ancient literature. At first a welcome release from the medieval suppression of human nature, it gradually produced a slavish imitation of classic forms of speech, especially those of Cicero. From the school at Deventer in the Netherlands 'humanistic studies' (*humaniora*) were diffused throughout Europe N. of the Alps. The Humanists paved the way for the Reformation, partly by struggling against the abuse of ecclesiastical authority, partly by their study of the Bible in the original tongues, although the humanistic attitude was often hostile to every kind of theological dogma. *Humanity* means everything that gives man a character in opposition to the brute, but especially the harmonious development of his moral and intellectual faculties.

Humanita'rians, a certain class of Christians in the first three centuries who asserted the mere and sole humanity of Christ, and denied his divinity in any and every sense of the term; some of them holding, however, to an extraordinary humanity in Christ, and others only to an ordinary. Under this general name of H., which again is a subdivision under the more general name of Anti-Trinitarians, are classed all those sects, such as the Ebionites (q. v.), &c., who denied both the deity and divinity of Christ.

Humayun', the second of the Mogul Emperors of India, son of Baber, and father of Akbar the Great. He reigned from 1530 to 1543, when he was defeated and driven out by his Afghan rival, Sher Khan. In 1555 he recovered his kingdom, but died in the following year. He lies buried under a white marble mausoleum at Delhi, erected by his widow, Hamida Banu, at a cost of £150,000.

Hum'ber, the estuary of the Ouse and Trent, 40 miles long, and from 1 to 8 broad, separates the counties of Lincoln and York, and has a direction first E. and then S.E. On its N. shore is Hull; on its S., Great Grimsby. It is somewhat obstructed by silting. At its mouth it is narrowed by the promontory of Holderness, the S.E. extremity of Yorkshire, which tapers out in Spurn Point to within 4 miles of the Lincoln shore.

Humble-Bee (*Bombus*), a genus of bees closely allied to the honey-bees, and living, like the latter, in social colonies. The common H.-B. (*B. terrestris*) is a familiar British insect, distinguished by the large size of its body, by the hairy covering of the body, and by the yellow and black bands which mark the upper surface. The tibiæ or shins of the hinder legs are two-spined. The nests of humble-bees are constructed underground, and vary in the number of their cells. The latter are loosely connected together, and are of oval shape. Three kinds of individuals—as in the honey-bees—males, females, and neuters or makers, constitute the H.-B. colony. The honey of these bees is fragrant, but appears to differ in its nature from that of the honey-bees. The *Bombus muscorum*, or foggie bee, constructs its nest of 'fog' or moss, and is also termed the 'carder bee,' from the manner in which it weaves the fibres of the moss together. *B. lapidarius*, or the red-tailed bee, constructs a nest amongst stone-heaps. A familiar species is the *B. Orientalis*, which attains a considerable size. The females of H.-B. colonies exist in each nest in considerable numbers, a feature in their economy in which they differ from the honey-bees. In the nests of the latter, a single female only, the 'queen-bee,' is permitted to exist.

Hum'boldt, Karl Wilhelm von, a German scholar and statesman, was born at Potsdam, 22d June 1767, of a noble Pomeranian family. After a home education, under the pedagogist Campe and the philosopher Engel, he studied at Göttingen under such men as Heyne the philologist, and was introduced to Jacobi and Müller, then leaders in German literature. A visit to Paris in 1789 suggested his essay on the *Limits of the Action of the State*, on which Mr. Mill has founded his essay on *Liberty*. The doctrine of individualism, the only desirable liberty, he thought, had been lost sight of in the French revolutions. The book is marked by a lofty sense of human dignity. H. now went to Wolf at Halle, and began an ardent study of Hellenic life through philological research. At Jena he formed an equally close friendship with Schiller, then lecturing on æsthetics; and there he also met Schlegel, the translator of Shakespeare; Goethe, who was writing *Hermann und Dorothea* (which H. afterwards made the text of his æsthetic essays), and Fichte. Inspired with the idea of writing a history of human culture, he began a four years' travel through S. Europe. Much of his experience is preserved in letters to his friends. In 1801 he became Prussian ambassador at the court of Pius VII., where his charming wife (herself a good Greek scholar) kept a brilliant salon, visited by Mme. de Stael, Courier, Thorwaldsen, Tieck, &c. In 1808 H. became Prussian Minister of Public Instruction and Religion, immediately after the audacious decree of Napoleon dismissing the patriot Stein and forfeiting his property. In 1810 he founded the University of Berlin, and became ambassador at Vienna, in which capacity he signed the Articles of Prag in 1813, which secured Austria to the coalition, and probably decided the fate of Napoleon. His clearness and steadfastness of purpose made him the match of Talleyrand and Metternich. At the Congress of Vienna he argued for the separation of Germany and Austria, which he saw to be inevitable, and was strongly opposed to the Holy Alliance. After this he gradually lost faith in the Prussian government, from which he was dismissed in 1819. The rest of his life was devoted to comparative philology, for which science he ransacked the dialects of three continents. One of his largest treatises traces the Sanskrit elements in the island of Java; another discusses the Basque idioms of Spain. He died at Tegel, near Berlin, 8th April 1835. H.'s *Sämmtliche Werke*, with a preface by his brother Alexander, were published in 7 vols. Berl. 1841-52. The best study of H. is by Haym, *Lebensbild und Charakteristik* (Berl. 1856). See also *W. von H.'s Briefen an eine Freundin* (7th ed. 1863).—**Friedrich Heinrich Alexander von H.**, brother of the preceding, was born at Berlin, 14th September 1769. The pupil of Heyne and Blumenbach, he early showed (in his memoir on the basaltic rocks of the Rhine) a passion for observation and travel. This was fostered by the acquaintance of Forster, a companion of Captain Cook, and by the teaching of Werner, under whom he studied botany at Freiberg. From 1792-97 he was director-general of mines in Anspach and Baireuth, but he found time for a literary partnership with Schiller in *Die Horen*, and for independent researches in the subjects of irrespirable gases and muscular irritability. Disappointed by war in his expectations of visiting Italy and Egypt, H., after making the acquaintance of Berthollet and Laplace at Paris, set out with Bonpland on his American tour in 1799. Exploring Venezuela from Cumana, they passed from the Ori-

noco to the Amazon. In 1801 he passed through Carthagena to Callao in Peru, and next year ascending to the plain of Bogota, he visited some of the volcanic Cordilleras and reached Quito. He climbed Chimborazo as he had climbed Teneriffe. Passing through Mexico, he visited Jefferson at Washington, and reached Bordeaux in the autumn of 1804. From 1805 to 1827 his life was spent at Paris, editing the enormous results of his expedition in seven great works on geography, ethnography, geology, and natural history—the whole forming a colossal treatise in 29 vols. (1807–27), with 1425 coloured engravings. The most interesting sections to the general reader are his *Voyages aux Régions équinoxiales du Nouveau Continent* (3 vols. Par. 1809–25; Ger. ed. 6 vols. Stutt. 1825–32); *Essai Politique sur le Royaume de la Nouvelle-Espagne* (2 vols. Par. 1811); and *Essai sur la Géographie des Plantes* (Par. 1805; Ger. ed. Tübing. 1807). In this period he also worked with Gay-Lussac on atmospheric and hypsometric observations, formed a friendship with Arago, and visited London with his brother Wilhelm. In 1829 the indefatigable explorer left his recently formed home at Berlin for a journey through Siberia to the borders of China, and back by Astrakhan and the Caspian to Moscow, the fruit of which was his *Asie Centrale* (3 vols. Par. 1843; Ger. ed. 2 vols. Berl. 1843–44), a work full of important new matter on minerals and the science of climate. All his works are marked by vivid description, as well as a free play of philosophic thought. Among his great geographical 'finds' in Asia were the Plain of Gobi, and the true height of Lake Baikal. H. was now at the height of his fame as a public man in Berlin, Paris, and London. In 1835–38 appeared his *Examen critique de la Géographie du Nouveau Continent* (Par. 1835–38; Ger. ed. 3 vols. Berl. 1836). He warmly asserted the possibility of a Panama Canal with fewer locks than the Caledonian. In the period 1845–62 he produced his most widely-read book, the *Kosmos* (5 vols.), a development of his earlier *Ansichten der Natur* (Fr. *Tableaux de la Nature*). In this he sums up in picturesque style his treasures of knowledge. The classification of rocks into eruptive, sedimentary, metamorphic, and conglomerate is given. His distribution of animals and plants is based on isothermal lines. He also generalises what was known of the interior and exterior planets, and the intermediate asteroids, of terrestrial magnetism, earthquakes, and volcanos. 'The modern Aristotle' died full of years and honours, 6th May 1859. See H.'s *Briefe an Varnhagen von Ense* (5th ed. 1861); *an Bunsen* (1869); also Life by Karl Bruhns (Eng. trans. 2 vols. Lond. 1874); Klencke's *A. V. Humboldt* (6th ed. 1870); and Goethe's *Briefwechsel mit den Gebrüdern von H.*, edited by F. T. Bratanek (Leips. 1876).

Humboldt River, a river of Nevada, U.S., rises in the H. mountains, and, after a course of 384 miles in a S. W. direction, loses itself in the H. Sink, a marsh surrounded by a desert. The H. is unnavigable even by boats; the largest tributary is the Little H.

Hume, David, philosopher and historian, born at Edinburgh, April 26, 1711, was the second son of Joseph Hume, of Ninewells, Chirnside, Berwickshire, and a daughter of President Falconer. His father died early. In 1723 he went to Edinburgh University, where he read chiefly 'books of reasoning and philosophy, poetry, and the polite authors,' and where he wrote *An Historical Essay on Chivalry and Modern Honour*. His early experiences are described by himself in his famous letters to Michael Ramsay and Dr. Cheyne. He came to the conclusion that 'moral philosophy was founded more on invention than experience.' In 1731 he passed through a strange bodily and mental crisis; and in 1734, after trying to settle in a merchant's business at Bristol, he went to France, where he spent three years in Paris, Rheims, and La Flêche. To 1737 belongs his *Treatise of Human Nature*, sold for £50 to John Noone, Cheapside. The volume on *Ethics* (revised by Hutcheson, and published by Longman), and the *Essays, Moral and Political*, followed in 1741–42, the former of which was very unsuccessful. One review, however, in *The Works of the Learned* compared these works to the juvenile efforts of Milton and Raphael. The *Treatise of Human Nature* was not, as commonly supposed, suppressed by H. For some years H. acted as companion to the Marquis of Annandale, and as judge-advocate to the forces on the Port L'Orient expedition, and as secretary to General St. Clair at Vienna and Turin, and from 1752 to 1756 he was librarian of the Advocates' Library. Refusing an invitation from Millar to edit a London paper, he republished a portion of his *Treatise* as *Inquiry Concerning the Human Understanding*, and the *Inquiry Concerning the Principles of Morals*. In his autobiography he laments the failure of these books, while Dr. Middleton's *Free Inquiry* was making a great sensation. To this period also belong the beginning of his *History of England* and his *Natural History of Religion*, which Warburton asked Millar the bookseller to suppress. From 1763 to 1766 he acted as Secretary of Embassy to Lord Hertford in Paris, where he received great attention from D'Alembert, Marmontel, Diderot, Helvetius, Tugot, Holbach, Buffon, &c. He says: 'I eat nothing but ambrosie, drink nothing but nectar, breathe nothing but incense, and tread on nothing but flowers.' His *Political Discourses* had already been translated into French by a Provençal named Macwillon, Secretary to the King of Poland. On his return Princess Amelia proposed to make him a bishop, and he was appointed a sort of Under Secretary of State for Scotland. The rest of his life was spent in 'St. David' Street, Edinburgh, where he enjoyed the friendship of Robertson, Cullen, Black, Blair, the two Homes, 'Jupiter' Carlyle, Ferguson, Smith. In April 1776 he wrote *My Own Life*, which was posthumously published by Adam Smith, H.'s literary executor, and which, along with Smith's affectionate and dignified letter to Strahan, drew down the wrath of John Wesley in his Halifax sermon. After an exhausting illness borne with cheerful fortitude, H. died August 26, 1776. It is impossible here to describe the philosophy of H., the greatest of modern metaphysicians. He pushed the doctrine of the relativity of human knowledge to its results; and in the then state of mental and social science he could perhaps do no more. He did not attempt to construct a positive system, and the German and Scottish philosophies which have since opposed his teaching perhaps show that, while right in principles of investigation, he had not sufficiently appreciated the facts of mind and society. Indications of his teaching on the fundamental questions of metaphysics will be found in other articles. In ethics he maintained, against Butler, Price, and Hutcheson, that both reason and sentiment enter into moral determinations; that the approbation of virtue varies with its social utility; that justice is really founded on the distinctions of private property; that natural generosity or sympathy co-operates with self-interest in forming moral feeling. There is a great deal of superficial partiality in the *History of England* (continued by Smollett), but it is still a delightful book, with remarkable information for the time in which it appeared. There is a *Life of H.* by Dr. Hill Burton, and a careful edition of his philosophical works by Messrs. Grosse & Green (Oxford, 1875).

Hume, Joseph, a politician whose influence for good is still felt in English finance, was born at Montrose, Scotland, in 1777, educated for the medical profession, and went out as assistant army surgeon in the Mahratta war in 1800. As interpreter and paymaster he rendered numerous services, and returned to England in 1808 with a considerable fortune. He had shown a taste for Oriental languages, but his desire was for political life. After representing Weymouth for a few months in 1812, and some years of travel, he was, in 1818, returned for the Montrose burghs, which he represented till 1830. This trust was renewed in 1842 till his death. In the interval he sat for Middlesex and Kilkenny. Through the teaching of Bentham and a natural capacity for figures he became a leader of the philosophical radicals below the gangway. The practical form of his principles was to insist on rigid economy and financial reform in all branches of the public accounts. The repeal of the combination laws, export and import duties, municipal and colonial administration, election expenses, Catholic emancipation, and electoral reforms also engaged his attention. In 1835 he warmly denounced the Orange lodges. H. died, 20th February 1855, at Burnley Hall, Norfolk. His function was one indispensable to the purity of the public accounts, for he not only objected to improper expenditure, but the fear of his objection was often sufficient to prevent its being stated. See Martineau's *History of England during the Thirty Years' Peace.*

Hu'mea, a genus of composite plants, of which *H. elegans*, a native of Australia, is the best-known species, and grown in gardens for its ornamental and graceful drooping habit. The plant when bruised emits a balsamic odour.

Hum'erus (Lat.) is the bone of the upper arm, extending from the scapula to the bones of the fore-arm, with which it is articulated. See ARM.

Humetté, in heraldry, is an ordinary—*e.g.*, a cross, *couped* or cut off so that it does not reach the shield's edge.

Hu'mic Acid (Lat. *humus*, 'the earth') occurs in certain circumstances in slowly decaying vegetable matter, and is met with in bog-earth, peat, turf, and other soils. Its colour is dark brown, and its composition is represented by the formula $C_{24}H_{18}O_9$. Sugar boiled with a dilute mineral acid gives a deposit which, when treated with ammonia and an acid, leaves H. A. behind.

Humirpore' (Hamirpur), the chief town of the district of the same name, in the N.W. Provinces, British India, at the confluence of the Betwa and Jumna rivers, 155 miles S.E. from Agra, and 110 N.W. from Allahabad. Pop. (1872) 7007.—The *district* of H. has an area of 2287 sq. miles; pop. (1872) 529,137. It is noted for artificial lakes encircling rock temples, now used for irrigation. The principal crops are gram, wheat, millet, and oilseeds, with a little cotton; the trade is insignificant. As in the rest of Bundlecund, the Mutiny of 1857 was made the occasion for murder and rapine.

Hummell'er, an agricultural machine for breaking off the awns of barley. It may either be attached to the thrashing-machine or be worked separately. There are various forms of it. The *cylindrical* H. consists of a vertical cylinder of wire-gauze having a revolving central shaft armed with thin flat iron blades, which remove the stumps of the awns as the barley, fed from a hopper, passes through the machine.

Humm'ing Bird, the name applied to many genera and species of Insessorial birds belonging to the section *Tenuirostres* ('slender-billed'), and especially to the family *Trochilidæ*. In this family the bill is very slender, and its tip is sharp. The nostrils are usually covered with a large scale. The wings are long and pointed, as also is the tail. In the typical genus *Trochilus* the edges of the upper mandible overlap the lower mandible at the base. The first quill of the wings is shorter than the second quill. The tail is forked, and has two feathers projecting beyond the others. The inner toe is shorter than the outer. The humming birds form a large group, extending over all parts of the New World, from the furthest N. to Tierra del Fuego. Many species are very limited and local in distribution, being found in many instances within a narrow area. These birds evince, perhaps, of the whole feathered creation, the brightest hues and most varied colours. Some of the species are of small size, looking hardly larger than bees, and appear like iridescent glittering gems as they flit among the flowers. Bailey's expression—

Humming Bird (ruff-necked).

'Bright humming bird of gem-like plumeletage,
By western Indians "living sunbeam" named,'

is a most appropriate and happy description of many of these forms. When they fly they produce a buzzing sound with their wings, this sound having given origin to their name. The food consists of honey and flower-juices, but most of the species also feed on small insects. The tongue is of remarkable structure. It can be protruded to a great length from the mouth, and is specially adapted for sucking up the flower-juices, whilst the structure of the bill is also well fitted for probing flowers. Most of the humming birds lay only two eggs. One of the best-known species is the ruby and moated H. B. (*Trochilus colubris*), found in N. America, and ranging over a large extent of country. Its general colour is a light metallic green glossed with gold, the under parts being of whitish hue, and the throat of a ruby red colour. The wings, as is commonly seen in humming birds, are of purplish-brown hue. The long-tailed H. B. (*T. polytmus*) of Jamaica is another familiar species, coloured light green above, and emerald green below, the tail being black. Its average length is 9 inches, inclusive of the ring-tail feathers. Other species belong to the genera *Heliactin* (sun genus), *Topaza* (topaz humming birds), *Heliomaster* (star-throats), *Eutoxeres* (sickle-bills), *Microchæra* (snow-caps), *Lophornis* (coquettes), &c.

Hu'moralists, a term used in medical literature to designate a sect who based their pathology upon the influence of the humors. See PATHOLOGY.

Hu'mulus, the genus of plants to which the Hop (q. v.) belongs.

Hu-nan' ('S. of the lakes'), a province of China, lying between the Nan-ling Mountains on the S. and the river Yang-tse-kiang. Area, 83,229 sq. miles; pop. 20,048,969. It is singularly fertile, and within its northern frontier lies the largest of Chinese lakes, Tung-ling-hw, with an area of 300 sq. miles, into which flow the Juan-kiang and Hing-kiang, after watering the province. The chief products are tea and rice; among the minerals are coal, iron, lead, and malachite. The capital is Chang-sha, on the Hing-kiang. The H. teas are mainly sent to Hankow (q. v.).

Hun'dred, or **Wa'pentake**, was perhaps the area in which 100 warriors of the invading Teutons had their primitive settlement. Wapentake points to an armed gathering of freemen. It is disputed whether the *lathes* (into which Kent is divided, probably from Jutish *lething*, 'a levy'), the *rapes* of Sussex, the *trithings* or Ridings of Yorkshire were originally the same. In some cases there was a subdivision into an H. Originally denoting personal relations, the H. in the laws of Eadgar (959–975) denotes the territorial subdivision of shire or kingdom. There was a H. *gemot*, convened by the H. *ealdor*, and attended by the local thegns and representatives from the towns. The court consisted in theory of all local freeholders, and had both civil and criminal jurisdictions. It was attended by the king's *geréfa*, to collect the *wite* or fine for offences. It enrolled persons claiming frankpledge, each in his tithing. The H. seems to correspond to the Archaic Irish *tuath* or *cantsed*, the Scandinavian *fylk*, the Slavonic *pulk*, the Gothic *gavi* or *gau*. Perhaps, however, the *herath* or *haerred*, a division of the fylk, would be nearer to the H. In Gothland there was a precisely similar division called *hundari*. The 'thing' of the fylk answered to the 'môt' of the H. The Latin name for fylk, 'centena,' is preserved in canton. The *pagus* of Cæsar and Tacitus was probably a more compact organisation than the H., and resembles more the Irish *baile*, which by the usual duodenary subdivision gave twelve *scisreachs*, just as in E. Anglia the H. gave twelve *leets*.

Hun'gary (Magyar, *Magyar Orszàg*, 'land of the Magyars,' Slav. *Vengria*, Ger. *Ungarn*, Fr. *Hongrie*), the independent Transleithan kingdom that with Austria forms the dualistic Austro-Hungarian empire. It consists of the crown land of H. Proper, Transylvania, Croatia, Slavonia, and the military frontier, and has a total area of 125,041 sq. miles, and a pop. (1869) of 15,509,455. With the Cisleithan portion of the state it is connected by a common dynasty and by a common Parliament ('the Delegations') of 120 members, of whom 60 are returned by each of the two sections of the empire. The Delegations legislate in imperial affairs, war, finance, foreign relations, &c. Internal legislation is vested in a responsible Ministry and in a Reichstag (at Pesth), consisting of the Magnatentafel (*Förendek*) of 731 members (1876), and of the Ständentafel (*Kendek*) of 444 representatives. The Emperor of Austria is called King of H. in all public acts. In 1875 the revenue of H. was £21,213,850, and the expenditure £22,746,415. For several years there have been increasing deficits, which have led to the contraction of a special debt, amounting in 1876 to £35,400,000. H. contributes 319,632 men to the army of the empire, according to the law of 1868.

Physical Aspect and Products.—The *crown land* of H. Proper has an area of 87,043 sq. miles, and a pop. (1869) of 11,633,162. It has an extreme length from E. to W. of 550 miles, and a breadth of 340, is mainly a vast plain with rich pastures and fertile tilths, bounded on the N. and E. by the Carpathians and on the W. by the Noric Alps, and partly intersected by the Danube and the Theiss, with their numerous tributaries. Treeless grass-flats (*pussten*), dotted with sand-dunes and swamps (*lansag*), extend along the great rivers. The Danube enters H. by the *Porta Hungarica*, in the Leitha Mountains, 30 miles E. of Vienna, then flows in an easterly direction for 115 miles, after which it turns abruptly S. to the frontier (185 miles), where it receives the Drave from the W.; it finally flows E., receiving the Theiss (828 miles) from the N., and forming the southern boundary. Other tributaries from the left are the March, Waag,

Neutra, Gran, and Eipel; from the right, the Raab and Leitha. The largest lakes of H. are the Balaton (q. v.) and the Neusiedler See (q. v.); in the Carpathians are many *Meeraugen* ('sea-eyes') or lakelets. The climate is somewhat extreme both in winter and summer, the plains being often swept by the bora and the sirocco (called the *föhn*), and the crops destroyed by sudden and violent hailstorms. The surface is occupied to the extent of one-third by magnificent forests of oak (especially in Baránya, between the Danube and Drave), beech, elm, birch, and pine; one-third is cultivated, yielding oats, barley, rye, maize, wheat, hemp, flax, tobacco, woad, madder, saffron, &c. The vegetation embraces nearly all the indigenous and many of the imported plants of Europe. Among the principal fruits, growing chiefly in the comitats of Zala, Somogy, Baránya, Behar, Arad, Berégh, Szaithmar, and Gömör, are the grape, plum, peach, walnut, almond, and fig. The vine is cultivated over 1220 sq. miles, and the best wine is the golden-green Tokay of the Hegyallja Mountains; while the white wine (of Pesth, Magyáret, &c.) is equal to the finest Rhenish. The forests, swarming with game, still afford a refuge to the wild-boar and wolf; and one of the chief occupations is the rearing of horses, sheep, and cattle. In wealth of precious metals H. ranks only inferior to Russia, and has some 2000 mines and 60 smelting furnaces. The minerals found are gold (£60,000 worth yearly), silver (£137,400 worth), copper, quicksilver, pig-iron, coal, and rock-salt. There are many mineral springs. Besides the internal communication afforded by the Danube, its navigable affluents and by canals (Baczker-Bega and Sarviz), H. has in operation (1875) 3999 miles of railways.

Ethnology, &c.—In no other country of Europe is there an equal variety of races. The pop. consisted in 1871 of 5,604,200 Magyars, 1,596,633 Germans, 1,248,217 Rumanians, 1,517,099 Slovaks, 206,600 Croats, 267,654 Serbs, 469,203 Ruthenes, and 715,266 Jews, Gypsies, Bulgarians, &c. Of these again, 5,884,472 are Roman Catholics (with three archbishops at Gran, Kalócsa, and Erlau), 982,142 Greek Catholics (under the patriarch-archbishop of Lemberg), 2,589,758 Protestants (mostly Calvinists), 1,141,216 Byzantine Greek Catholics, and 517,338 Jews. Education is in a comparatively forward state; 47 per cent. of the men and 55 of the women can read and write. In 1871 there were 99 upper and 47 lower gymnasia, with 30,992 pupils and 1624 teachers; 11 upper and 17 lower *realschulen*, with 5472 pupils and 267 teachers, besides many religious seminaries. The University of Pesth in 1875 had 1912 students and 122 professors; and connected therewith is a seminary for the training of teachers. The Government grant to churches and schools was £392,420 in 1875.

Language and Literature.—Magyar, the name of the dominant people of H., is also that of their language. The Magyars are the most numerous section of the Ugrians (q. v.), and their language closely resembles that of the Finns, especially in its grammatical forms and in its vocables. It has a more strident sound than Finnish on account of its compound sibilants *cs* and *cz*. The four principal dialects are the Palócz of the Mátra mountains, in which are the greatest number of ancient words; the Györi, prevailing in the Raab valley; the Bihari, spoken in the basin of the Theiss; and the Székely of Transylvania, containing many Tartar words. Christianity was introduced into H. about the end of the 10th c., and with it came the Roman alphabet, and Latin as the language of the Church, the law courts, and of literature. The 13th c. saw the foundation of many schools and libraries; but the native language only found vent in translations of the Bible (as early as 1384), and in hymns and ballads. From Bohemia the Reformation found its way hither, and its chief literary results are the translations of the Bible by Komjáti (1533), Pesti (1536), Sylvester (1541), Heltai (1546), Székely (1548), and Melius (1565); and native Magyar chronicles by Székely (1559), Temesvári (1569), Heltai (1572), &c. But on the accession of the Hapsburg family Latin was confirmed as the official language, and the Jesuits (from 1561) threw discredit on Magyar as being a veil for heresy. In the 17th c. Latin enjoyed almost undisputed supremacy. It was the language of the first regular Hungarian newspaper, begun in 1721. As in Poland, Latin here made the nearest approach to 'a vernacular without becoming one' (Latham.) A bibliographical list of all Magyar works gives only twenty-nine trivial publications for the year 1784. But in that year Joseph II.'s attempt to substitute German for Latin awakened the national spirit, and, by resolution of the Diet at Presburg, Magyar became henceforth the language of law courts and schools. The first Magyar journal, by Matthias Ráth, appeared in 1781. It was followed in 1788 by Kazinczy's *Magyar Museum*, which gave impetus to the reviving literature. A national theatre was opened at Pesth (1793), where was produced the first Magyar comedy, by Karoly Kisfaludy, in 1817, and where the plays of Joseph Szigligeti subsequently (since 1834) laid the foundation of a rich native drama. In 1836 began to appear the Baron Josika's brilliant series of historical romances. Louis Kossuth, in editing the *Pesti Hirlap* (1841–44), did much to improve the language in flexibility and elegance. Sándor Kisfaludy (author of *Himfy's Love*, 1817) is perhaps the earliest, Sándor Petöfi is the greatest of the recent Magyar poets, who have given at least to the lyric in its weird pathos and its wild freedom the charm and character of national life. Eminent among song-writers are Victor Dalmady, who has been compared to Moore; Vajda, a fiery, voluptuous lyrist; and Endrödy, the genial author of *Tücsökdalok* ('Songs of Crickets'). The greatest living representative of fiction (1877) is Maurice Jókai. There is a Petöfi Society for the encouragement of *belles lettres*, and an historical academy, presided over by Horváth, and receiving from Government a yearly subsidy of 50,000 florins. The latter body publishes the valuable *Monumenta Hungariæ Historica*. In 1877, according to the *Vasarnap Ujság*, there are 268 Magyar periodicals, 128 of which are issued in Buda-Pesth, 139 in provincial towns, and 1 abroad. H. also has 146 foreign journals, 85 of which are in German, 42 in Slavonic, 13 in Rumanic, 4 in Italian, 1 in Hebrew, and 1 in French.

History.—The country now known as H. was formerly a Roman possession, forming part of Dacia and Pannonia. It was overrun by the Franks, Huns, and Avars, and towards the end of the 9th c. was divided into many petty kingdoms of Slavs, Bulgarians, Wallachians, and others. Under Almus and his son Arpad (q. v.), the hero of Hungarian romance, the Magyars advanced from the region of the Ural Mountains and took possession of the land far beyond the Theiss about 894. They conquered the country between the Danube and the Drave to the foot of the Styrian Alps in 899. The broad lands thus acquired were divided by covenant among 108 chiefs under fealty to the house of Arpad, and thus remained till Stephen I. (997–1038), broke the power of the nobles by establishing a monarchy. As a reward for his vigorous exertions on behalf of the Latin Church he received from Pope Sylvester II., in the year 1000, a crown that still forms the upper part of the *sacra regni Hungariæ corona*. Besides introducing Christianity among his people, he divided the country into ten bishoprics and founded classical and theological schools. He also greatly developed the military and civil administration, portioning the country into seventy-two comitats. In the subsequent reigns of Peter I. (1038–46), Andreas I. (1046–60), and of Bela I. (1060–63), there was much reactionary fighting against Christianity. In the dark, eventless period that follows, the valorous Vladislav I. (1077–95), and Coloman the 'learned' lawgiver (1095–1114), stand out in bold relief. In the time of Gejza II. (1141–61) Flemish settlers inaugurated mining in the Carpathians. Andreas II. (1205–35) was forced by the nobles to sign the *Bulla Aurea*, the great charter of Hungarian liberty; his son, Bela IV. (1235–70), though unable to stem the invasion of the Mongols (1241–43), sharply punished Friedrich II. of Austria for ungenerous conduct during the occupation of the barbarians. The Arpad dynasty expired with Andreas III. (13th January 1301), and the Duke Charles Robert of Anjou succeeded by marriage to the throne in 1307. Lewis I. (1342–81) extended the domination of H. far into Poland and Russia, and eventually united his crown with that of Poland in 1370. As son-in-law of Lewis, the Emperor Sigismund of Germany became King of H., and in his reign occurred the inroad of the Turks (1391) and the Hussite wars. During the reigns of Vladislav III. and Vladislav IV. the wars with the Turks excited the attention of all Christendom, and out of these arose the hero János Hunyady (q. v.), whose son, Matthias Corvinus (q. v.), was elected King of H. in 1458. Matthias more than justified his election by his indomitable valour in battle against Turks, Poles, and Austrians, and by the wisdom which generously encouraged a taste for art and literature. He was succeeded by the Bohemian King, Lewis II. (1490–1516), in whose reign broke out the Peasant War, which was subdued by the famous János Zápolya, after

which the whole of the peasantry was reduced to serfdom. Lewis II. was killed in the battle of Mohacz (q. v.), the crowning disgrace of H. at the hands of the Turk. By marriage of his sister Anna with Ferdinand of Austria, H. fell to the house of Hapsburg in 1526. The subsequent history of H. is given in the article on the empire of Austria. See also Gebhardi, *Geschichte von Ungarn* (4 vols. Leips. 1778–82); Katona, *Historia Critica Ducum et Regum Hungariæ* (42 vols. Pesth, 1779–1808); Fessler, *Geschichte der Ungarn und ihrer Landsassen* (10 vols. Leips., new ed. 1867); Mailáth, *Geschichte der Magyaren* (5 vols. Vien. 1828–31); Alderstein, *Archiv des Ungar. Ministeriums* (3 vols. Altenburg, 1851); Görgei, *Mein Leben und Wirken in Ungarn* (2 vols. Pesth, 1860–63); Karl Keleti, *Länder der Ungarischen Krone* (Pesth, 1872); F. von Löher, *Die Magyaren und andere Ungarn* (Leips. 1874); A. J. Patterson, *The Magyars, their Country and its Institutions* (Lond. 1870); J. Hunfalvi, *A Magyar-Osztrák Monarchia rövid statistztikaja* (Pesth, 1874); and Paul Hunfalvi, *Ethnography of H.* (Pesth, 1876).

Hungary Water, an alcoholic perfume, obtained by distilling grape-spirit over Hungarian rosemary, the essential oil of which is thereby extracted. The recipe for its preparation is said to have been given by a hermit to a queen of Hungary in the 14th c. This legend Beckmann (*History of Inventions*) rejects as fiction.

Hun'gerford (formerly *Ingleford*, originally *Englaford*, 'the ford of the Angles'), an English market-town, partly in Wilts, partly in Berkshire, 61½ miles W. of London by railway, stands on the Kennet, a fine trout-stream, and is traversed by the old Roman road to Bath. Pop. (1871) 3064. Here William III. met James II.'s agents in 1688.

Hün'ingen (formerly Fr. *Huningue*), a town of Germany, in Ober-Elsass, on the left bank of the Rhine, 4 miles N. of Basel by railway. It had fortifications by Vauban till 1814. In the vicinity there is an establishment (founded 1852) for the breeding of fish, which has an area of over seventy acres. The Rhine is here crossed by a pontoon bridge. Pop. (1875) 1456.

Huns (Lat. *Hunni*, Gr. *Ounnoi* and *Chounoi*), a set of Scythian nomads, probably of Mongolian race, who first appeared in the Plains of Tartary threatening the Chinese frontier about 200 B.C. They then moved westward to the district between the Caspian and the Dniester, where they almost destroyed the Alani. Passing still westward to the Danube in the second half of the 4th c. (Christian), they drove the Visigoths and the Gruthungi or Ostrogoths into Roman territory. Partly helped by the Goths, they next attacked Rome itself, and at Adrianople defeated the imperial armies and killed the Emperor Valens. The period of their greatest power was under Attila, in the middle of the 5th c. His death seems to have dissolved the bond of union among the various tribes, who, pressed by the Goths, fell back across the Don, some of them settling in Pannonia. The name appears in Hungary. The Nepthalitæ or White H. invaded Persia in the time of Firoze. The H. are now undoubtedly lost; we have not enough to identify them by. See Gibbon's *Decline and Fall of the Roman Empire*, and De Guigne's *Histoire des H.*

Hunt, James Henry Leigh, an English poet, essayist, and journalist, was the son of a West Indian lawyer, and was born at Southgate, Middlesex, October 19, 1784. He was educated at Christ's Hospital, and in 1802 published *Juvenilia*, a volume of poems. After remaining a short time in a lawyer's office, and afterwards in the War Office, he became, at the age of twenty, dramatic critic to his brother's paper the *News*, and thenceforth led an exclusively literary life. In 1808 the two Hunts started the *Examiner*, and from 1813 to 1815 Leigh was imprisoned for having penned sarcasms on the Prince Regent. He produced in 1816 the *Story of Rimini*, a fine poem, which was heartily reviled by the critics, but the *Indicator*, a weekly modelled on the *Spectator*, which he started in 1819, had considerable success. H. went to Italy in 1821, and joined with Byron and Shelley in bringing out the *Liberal*, but the paper was a failure, and H. quarrelled with Byron, whom he assailed in his *Lord Byron and some of his Contemporaries*. He returned to England in 1825, and spent the rest of his life in London, starting the *Tatler* and *London Journal*, writing to periodicals, and producing various works in prose and verse, as *Captain Sword and Captain Pen*, a poem (1839), *The Legend of Florence*, a play (1841), *Imagination and Fancy* (1845), *Wit and Humour* (1846), *Stories from the Italian Poets* (1846), *Men, Women, and Books* (1847), *A Jar of Honey from Mount Hybla* (1847), *The Lovers* (1848), his *Autobiography* (1850, 2d ed. 1861), *The Religion of the Heart* (1853), *The Old Court Suburb* (1855), &c. H. died August 28, 1859. H. was a radical in politics, and held a vague optimistic deism. His poems have a pleasing lightness and airy fancy, abound in tender but not deep romantic sentiment, and are imbued with a peculiar blossomy freshness. His essays are exquisitely simple and graceful in style, containing much delicate criticism and Addisonian humour. See *H.'s Letters and Correspondence*, edited by his son, Thornton Hunt, in 1862.

Hunt, William Holman, an English painter, was born in London in 1827. As a young artist he was one of the founders of the pre-Raphaelite school, and all his works show the intense study of nature and minute accuracy in depicting it aimed at by that body. His earlier subjects were taken from scenes in romance and poetry, but he has latterly painted chiefly religious pictures, of which he has produced a splendid series, including the 'Hireling Shepherd' (1852), 'The Light of the World' (1854), 'The Scapegoat' (1856), 'Christ in the Temple' (1860), and 'The Shadow of Death' (1873). The two last-named works were the fruits of several years' study in Palestine, were separately exhibited, and sold for enormous sums. Among his secular pictures are 'Valentine receiving Sylvia from Proteus' (1851), 'Claudio and Isabella' (1853), 'Our English Coasts' (1853), and 'The Festival of St. Swithin' (1868). Mr. Hunt is at present (1877) engaged on an important painting at Jerusalem, where he has a studio.

Hunt, William, an English water-colour painter, born in London in 1790, became a member of the Society of Painters in Water-colours in 1824, and won high rank as an artist. He died in 1864. His works display scrupulous fidelity to nature, and combine delicate poetic feeling with breadth of effect and rich accuracy of detail. Mr. Ruskin places H. among the greatest English colourists, and especially praises his sympathetic representation of peasant boys. Among H.'s paintings are 'Peasant Girl,' 'Farmhouse Beauty,' 'Old Pilot,' 'Bunch of May,' 'Roses,' 'Fast Asleep,' 'Oak Trees,' &c.

Hun'ter, William, a distinguished Scottish surgeon, born at Long Calderwood, in the parish of Kilbride, Lanarkshire, 23d May 1718, was educated for the Church, but meeting with William Cullen (q. v.) about 1739, he agreed to enter with him into a medical partnership, each partner studying and practising in alternate years. This, however, did not last long, for H. went to London, and began to lecture on surgery at the Society of Naval Surgeons (1744). He afterwards took the subject of anatomy, and finally that of midwifery. In 1764 he became Physician Extraordinary to the Queen; in 1767 he entered the Royal Society, and in 1781 succeeded Fothergill as President of the College of Physicians. He died 30th March 1783, very wealthy. His successes as a teacher and practitioner had been great. His brother and others helped him in the lectures. He was the first great scientific accoucheur. The dispute with his brother about the determination of the structure of the placenta was probably not due to his fault. His chief work was the *Anatomia Humani Gravidi Uteri* (Birmingham 1774; English Lond. 1794), with plates from his own dissections. His occasional writings all refer to obstetric problems: they include the discovery of the varicose aneurism. His offer to found an anatomical school in London having been refused by Government, he left his museum in Windmill Street (with preparations, coins, books, and natural history specimens), with £8000 in trust to convey to Glasgow University at the expiry of thirty years. This was done. The coins were catalogued by Dr. Combe. See Simmens, *Account of W. H.* (Lond. 1783).—**John H.**, younger brother of the preceding, also born at Long Calderwood, 14th July 1728, received no university education. He worked three years in a carpenter's shop, and then went (1768) to London to help his brother William in the dissecting-room. After long surgical training in the hospitals, under Cheselden

and others, in 1759 he was regularly associated with his brother in lecturing. After two years' voyage to recruit his exhausted strength (for he studied intensely), he began surgical practice in 1763. This grew slowly, and he found it necessary to teach. Jenner and Home were among his pupils. In 1768 he became Surgeon to St. George's Hospital, having previously entered the Royal Society. His great exertions left him subject to heart disease, which his rough fiery nature made more dangerous. He died of this disease, October 18, 1794. H. was one of the first to see clearly how much physiology depended on the comparative sciences of form and function. He accordingly ransacked menageries to fill a house which he kept at Brompton for purposes of experiment and dissection. He had many doubtful relations with body-snatchers, and one amusing story is told of the enthusiasm with which he watched a huge Irishman, O'Brien, whose skeleton he had resolved to get. One consequence of this was that he was always in want of money; his museum (afterwards bought by Government for £15,000) having cost him £70,000. Until Owen prepared the Hunterian catalogues, it was not known how vast was H.'s knowledge, his ten volumes of MS. notes and designs having been destroyed after his death. Filled with his own general views of the science of life, H. had a contempt for books. He probably owed one or two ideas to Harvey. Among his more famous writings we may mention, on the *Descent of the Testis* (1762), a development of Sharp's observation of congenital hernia; on *Absorption by Veins* (or rather *non-absorption*, a doctrine exploded by Majendie); on the *Natural History of the Human Teeth* (a development of Leuwenhoh's thesis); on the *Digestion of the Stomach after Death* (shown in the perforations of healthy stomachs); *Anatomical Observations on the Torpedo* (1773), proceeding on the idea thrown out by Bancroft (the friend of Priestley and Franklin), that the violence of the torpedo was due to electricity; *An Account of Air-Receptacles in Birds*, the honour of which discovery was disputed by Peter Cowper; on the *Heat of Animals*, or rather on the power of resisting cold possessed by cold-blooded animals, a continuation of the experiments of Duhamel on warm-blooded animals; *Observations on Inflammation of the Internal Coat of the Veins* (1784), a theory of phlebitis which was taken up afterwards by Abernethy; *Treatise on the Venereal Disease; Treatise on Blood, Inflammation, and Gunshot Wounds*, in which he tries to explain several pathological phenomena by the analogy of the coagulation of the blood. H. disputes with Desault the application of Anel's method of ligature *above* the sac to aneurisms on large arteries without opening the sac. H.'s views on fossil bones and monsters (or cases of arrested development) have been largely verified by later investigations. The best edition of H.'s works is Palmer's (4 vols. 1835), to which is prefixed a *Life of H.* by Ottey. There are other biographies by Home, Foote, and Adams.

Hunting Dog (*Lycaon venaticus*), a species of Canidæ or dogs found in S. Africa, and also known by the name 'hyæna dog.' These dogs live in packs, and in a natural state are wild and bold. The colour is a reddish brown marked with black and white. The ears are large and prominent, and the nose and muzzle are black. The tail is bushy, and is white at its base and black at the tip. The fore feet possess four toes only.

Hun'tingdon, the chief town in the county of H., England, on the left bank of the Ouse, 59 miles N. of London by rail. It extends for about a mile along the line of the ancient Ermine Street, and is near the site of the Roman station of *Durolapins*. Here are the county hospital and lunatic asylum, a grammar-school with two exhibitions to Cambridge, works for making perforated bricks, breweries, an iron foundry, &c. H. has a weekly cornmarket. An old stone bridge of six arches across the Ouse connects H. with the suburban village of Godmanchester. Pop. (1871) 4243. H. sends one member to Parliament. It is the birthplace of Oliver Cromwell.

Huntingdon, Selina, Countess of, the daughter of the second Earl Ferrers, was born August 24, 1707. She married in 1728 Theophilus, Earl of H., whose death in 1746 was nearly accompanied by that of four of her seven children. On her bereavement she sought comfort in the revival movement of Wesley and Whitefield, attaching herself to the latter as the leader of Calvinistic Methodism, and spending her ample fortune in the endowment of numerous chapels and a college. On her death, June 17, 1791, there were 64 chapels (now over 100) belonging to the 'C. of H.'s connection.' The peculiarity of the sect is that it adapts the liturgy of the Church of England to the congregational system of government.

Huntingdonshire, the third smallest county of England, is bounded by the counties of Bedford, Northampton, and Cambridge. Area, 327 sq. miles; pop. (1871) 63,708. It is slightly hilly in the S., but in the N. forms part of the fen-country. The chief rivers are the Ouse and Nen, and the subsoil is in great part Oxford clay. Portions of the 'meres' have been converted by draining and cultivation into the richest of English meadows. The principal crops are wheat, oats, beans, barley, hemp, hay, and clover. In 1876 there were 100,848 acres under corn crops, 21,597 under green crops, and 59,098 in permanent pasture, exclusive of hill and heath; also 24,725 head of cattle, 156,245 sheep, and 17,971 pigs. The manufactures are mainly bricks and tiles, paper, parchment, madder, beer, and leather. H. sends two members to Parliament. It is crossed by two Roman roads, and has yielded many antiquities, including urns, coins, and encaustic tiles.

Hunting Horn, a slightly curved horn, known as the H. H., is a common bearing in heraldry. When there is a band round the horn it is said to be *garnished*. The *bugle-horn* in heraldry is a semicircular horn.

Hunting Spider (*Salticus scenicus*), sometimes also named the zebra spider, from its brown colour being variegated with white bands, is a common British spider of active habits, found on walls and on trees, pursuing its prey with great persistence and agility. Three pairs of spinnerets exist in the H. S., which has also very long legs.

Hunt'ly, a town of Scotland, Aberdeenshire, in the hilly district of Strathbogie, at the confluence of the Deveron and Bogie, 24 miles N.W. of Aberdeen by rail. It has some linen industry, and a trade in grain, leather, bricks, &c. H. gives the title of Marquis to the Gordon family, of whose old castle (demolished after the battle of Glenlivet, 1594) there are ruins near Deveron bridge. Pop. (1871) 3570.

Hunts'ville, a town of Alabama, U.S., 10 miles N. of the Tennessee river, on a spur of the Cumberland mountains, has several fine public buildings, a brass and iron foundry, planing-mills, &c. Pop. (1870) 4907.

Hun'yady, János Corvin, a Hungarian hero, was born at Hunyad, in Transylvania, in 1387. A baseless legend made him the son of Emperor Sigismund and Elizabeth Palæologus. He first appears in 1439 supporting the usurper Vladislav of Poland on the throne of Hungary against the infant heir of Emperor Albrecht II. To reward his services at Belgrad and elsewhere against the Turks of Amurath (who called him Yanko), he was made Vaivod of Transylvania. Another great victory at Nissa led to the Peace of Szegedin (12th July 1444). After the disaster of Varna (10th November 1444), in which Vladislav was killed, H. acted as governor-general till 1453. He often co-operated with the Albanian Prince Scanderbeg against the Turks. H. was superseded in political power by Count Ulrich of Cilly, but gave a closing proof of his power as a popular military leader by raising the siege of Belgrad (14th July 1456), when Mahomet II. lost a large army and his whole cannon (300 pieces). H. died at Semlin, 10th September of the same year. His second son became King Matthias of Hungary.

Hu-pé ('north of the lakes'), a province in the heart of China, in the basin of the Yang-tse-kiang. Area, 69,480; pop. 28,584,564. It is named from the network of lakes in the S., along the course of the Yang-tse, which here receives its great affluent the Han-kiang. H. is perhaps the most highly cultivated and productive of all the provinces of China. It gives name to a famous tea, produces also hemp and tobacco, and exports raw silks. Wu-chang-fu, on the Yang-tse, is the capital, and its suburb of Hankow (q. v.) was opened to foreign commerce in 1858.

Hup'feld, Hermann, an eminent German linguist and theologian, was born at Marburg in 1796, studied Hebrew and exegesis under the guidance of Gesenius at Halle, he became Professor of Oriental Languages at Marburg in 1827, and was called to Halle as the successor of Gesenius in 1843. He died 24th April 1866. H. was a thoroughly scientific scholar in the

circle of Oriental languages, and his work, though fragmentary, is of great value for the grammar and exegesis of the Old Testament. His masterpiece is the *Uebersetzung und Auslegung der Psalmen* (4 vols. Gotha, 1855–61). Other important productions are *Ueber Begriff und Methode der sog. Biblischen Einleitung* (Marb. 1844), *Die Quellen der Genesis aufs Neue untersucht* (Berl. 1853), and *Untersuchungen über die Feste der Hebräer* (Halle, 1851–64).

Hu'ra belongs to the Spurge family or *Euphorbiaceæ*, and is represented by a single species, a native of tropical America, called *H. crepitans*, the sandbox-tree. It grows 30 to 40 feet high, branches widely, and possessing a dense mass of foliage, is planted for the sake of its shade. The segments of the curious hard-shelled fruit, which is about the size of a small flattened orange, when ripe, burst from the common axis with a report like that of a pistol, hence sometimes called 'the monkey's dinner-bell.' The green seeds are emetic and violently purgative, and the milky juice characteristic of the order is abundant and venomous.

Hurd, Richard, D.D., an accomplished scholar and a bishop of the English Church, was born 13th January 1720, at Congreve, in Staffordshire, studied at Cambridge, and was ordained priest in 1744. His commentary on Horace's *Ars Poetica*, published in 1749, procured for him an introduction to Bishop Warburton. After holding several livings, he became in 1775 Bishop of Lichfield and Coventry, and in 1781 of Worcester. He declined the primacy in 1783, and died 28th May 1808. The best known of his works are his edition of the *Ars Poetica*, his *Dialogues, Moral and Political* (1765), his *Letters on Romance and Chivalry*, his *Twelve Discourses on the Prophecies*, his *Sermons*, his edition (1788) of the works of Warburton in 17 vols., his *Life of Warburton* (1795), &c. H. had an elegant, acute, and persuasive intellect, but did not sufficiently disdain the arts of a sophist. See the Life prefixed to the *Complete Works of H.* (8 vols. Lond. 1810).

Hurd'les, wicker frames of about 6 feet by 2 feet 9 inches used in warfare to form fences. *H.-batteries*, invented by Sir William Congreve, are made by arranging H. in the form of triangles and filling up the space between them with earth.

Hurdui, the chief town of the district of the same name, in the province of Oude, British India, and a station on the railway, 62 miles N.W. of Lucknow. Pop. (1869) 6415.—The *district* of H., which lies between the Ganges and the Gumti, has an area of 2292 sq. miles. Pop. (1869) 930,977.

Hurd'war (*Hari-dwar*, 'the gate of Hari or Vishnu'), a town in the district of Seharunpur, N.W. Province, British India, on the right bank of the Ganges, 924 miles N.W. of Calcutta. Pop. (1872) 4800. The Ganges here debouches on the plain, being still 1024 feet above the sea; and this spot is the most holy place of pilgrimage in its entire course. The bathing season is in April. It is said that 100,000 persons come annually, and thrice that number every twelfth year; the next of these great occasions will occur in 1883. H. was sacked by Timur in 1398, and has often been the scene of battles between rival sects of pilgrims. In 1819, 430 persons were trampled to death.

Hurdygurdy (the Continental *Leyer* or *Bauern-leyer*), a flat, oblong musical instrument with four strings. Two strings produce a drone-bass; the simplest melodies only can be played on the other two.

Hu'ron, the central and third largest of the five great N. American lakes of the St. Lawrence basin, divides the State of Michigan from Upper Canada, has an area of 23,800 sq. miles, a circuit of over 1000 miles, and a maximum depth of 1800 feet. The Manitoulin Islands (q. v.) and the peninsula of Cabot's Head separate it into two unequal portions, the easternmost of which is named Georgian Bay. H. is connected with Superior by St. Mary's, and with Michigan by Mackinac Strait, its outlet being by the St. Clair River. It lies 574 feet above sea-level, is subject to violent tempests, abounds in fish, and is remarkable for the purity and coldness of its water, being frozen over for five months in the year. The affluents of H. are numerous but unimportant, the chief being the French river and Severn, flowing into Georgian Bay, and, on the western side, the Saginaw.

Hurons. See INDIANS, AMERICAN.

Hurryhur' (*Harihara*), a British cantonment in the State of Mysore, Southern India, on the right bank of the Tungabudra river, a tributary of the Kistna, 132 miles N.W. of Seringapatam, and 320 N.W. of Madras. Pop. (1871) 6401.

Hurst, in heraldry, a clump of trees.

Hûs (commonly but incorrectly spelt **Huss**), **Johannes**, a martyr to his persistent and outspoken testimony against prevailing abuses in the Christian Church, was born in 1369 (or 1373) at Husinecz in Bohemia, studied philosophy and theology at the University of Prag, and graduated in 1396. Having in 1398 begun to teach in the university, he was, in 1401, made Dean of the Faculty of Philosophy and in the same year was appointed preacher in the Bethlehem Chapel, where the sermons were delivered in the vernacular Czech. He soon came thus to exert a powerful influence on the people; and, partly owing to his familiarity with the works of Wiclif, becoming deeply convinced of the corrupt condition of Christian morals and practice, he thundered not less energetically against the corruptions of higher and lower clergy than against the sins of the common folk. This and his defence of some of Wiclif's theses soon brought him into direct conflict with the ecclesiastical authorities. At first favoured by his Archbishop and supported by the King, H. in 1409 greatly furthered his cause in Bohemia by a reform of the university, the result of which was that upwards of 5000 foreign students and professors left Prag, leaving the management of the university in the hands of the native Bohemians. Yet, in 1411, H. was excommunicated and summoned to Rome, whither he declined to go. But as Prag was put under interdict so long as it gave shelter to the excommunicated theologian, he, in 1412, forsook the city and lived under the protection of the nobles who favoured his cause. When the universal council to which he had appealed was assembled at Constance, H. accepted the summons to defend himself there. Soon after his arrival, in November 1414, he was, in defiance of the safe-conduct granted by the Emperor Sigismund, thrown into prison. Not till June 1415 was he brought before the council; at three successive sittings the defence made by H., sick and solitary but steadfast, was unheeded, and on the 6th July, as he refused to withdraw errors which had not been proved against him from Scripture, he was condemned to be degraded and burnt, and his ashes to be thrown into the Rhine. The sentence was fulfilled that day. He died firm in the faith he had his life long preached. Practical in the turn of his mind, H. addressed himself to the special corruptions with which circumstances forced him into contact, and did not always draw the full consequences of his teaching, still less develop a well-defined system. How far he was from being a thoroughgoing follower of Wiclif is apparent from the fact that he nowhere says anything against the adoration of relics, against celibacy or monasticism. And though firm as a rock, he was not the man to found a new church or foresee the bearings of a great enterprise; he was of the stuff of which martyrs, not reformers, were made. In person he was tall and pale of countenance. His enemies admitted the irreproachableness of his life and the loveliness of his character. His chief works are *Actus pro defensione libr. Joannis Wiclif de Trinitate, Quæstio de Indulgentiis, contra Bullam Papæ Joannis XXIII.*, and *De Ecclesia*, together with sermons in the Czech language (the orthography of which he systematised), and a few poems. Ulrich von Hutten first began to edit H.'s works in his *Historia et Monumenta Jo. Huss atque Hieron. Pragensis* (Nürnmb. 1588, new ed. 1715). See Wendt's *Geschichte von H. und den Hussiten* (Magdeb. 1845); Helfert, *H. und Hieronymus* (Prag, 1853); Hofler, *Magister Johannes H.* (Prag, 1864); and Bezold, *König Sigismund und die Reichskriege gegen die Husiten* (Munich, 1877).

Hus'band and Wife. By the law of England the *personal* Estate (q. v.) (and articles there referred to) belonging to a woman before her marriage, on her marriage vests absolutely in her husband. But see under CONTRACT, *Contract of Marriage*. Of *real* property, the freehold and inheritance of the wife, the husband only receives the profit during her life. The law gives the same limited power to the husband over any real estate accruing to the wife during Coverture (q. v.). A married woman cannot make a legally binding contract without the expressed or implied consent of her husband. If a wife sell the goods of her husband, or dispose of them, the sale or disposal is void; or if she buys goods without his consent, he is not charge-

able with them, but this consent will be held implied in matters usually under the management of a wife. A note or bill drawn by a married woman during coverture is void; so is her endorsation. A husband may restrain the person of his wife in case of gross misconduct, but if the restraint be unreasonable the law will relieve the wife by a writ of *Habeas Corpus*. If the wife be injured in person or property, she can bring no action for redress without the concurrence of her husband. Neither can she be sued without citing him as defendant, unless he is dead in a legal sense. (See CIVIL DEATH.) By 16 and 17 Vict. c. 83 husbands and wives are made admissible witnesses for or against each other in any civil judicial inquiry, but they are not so in criminal cases. In treason the wife may be evidence for the crown against her husband; so may she also be in an indictment for Abduction (q. v.) and marriage. In indictment for Bigamy (q. v.), though the lawful husband or wife cannot be a witness, the man or woman misled may be. When a husband has allowed his wife to act as his agent, her evidence respecting her agency is admissible. Thus when a wife made a bargain for board for herself and husband, an action against him for relative payment was decided in favour of the plaintiff. A husband is bound to maintain his wife according to his rank and means, and if she contract debt for goods requisite for this maintenance he is bound to pay it. But this obligation ceases if she leave her husband without his consent, on his giving public notice of his dissent to her absence. If a husband expels his wife from his house for legal misconduct, her subsequent contracts do not bind him. If the wife elopes the husband is no longer bound. But his liability continues if she justifiably leaves her husband, as when she leaves on reasonable suspicion of personal violence, though no violence has been committed. If a man marry a wife with children, he is not by the act of marriage bound to support them, but if they live with him he will incur the legal liability of a father. (See PARENT AND CHILD.) The legal relation of H. and W. was defined in the Court of Criminal Appeal, June 3, 1854. A woman had fled with her paramour from her husband's house, taking with her some money, a considerable portion of which was found in the man's possession when he was arrested. He was tried for stealing the money, and convicted. The conviction was appealed against on the ground that a wife cannot rob her husband, and consequently that the convict could not have received stolen property. The conviction was sustained, the court finding that while the general rule of law was that a wife could not steal from her husband, in this case the woman had by her misconduct lost the privileges of a wife, and consequently forfeited her implied authority over the goods of her husband. The law of Scotland does not materially differ from that of England as regards the legal relation of H. and W. In both countries these may be altered by anti-nuptial contract, or by post-nuptial contract if the husband be solvent at the date of executing the deed. The latter contract is in England binding on wife and children in all cases, while in Scotland it only is so if they get by it a better provision than they would otherwise have got. The mode by which the legal relation of H. and W. may be entered into is essentially different in Scotland from what it is in England. See MARRIAGE LAWS, DIVORCE, ADULTERY.

Hus'bandry, Servants in. Differences between masters and S. in H. may be determined summarily by a Justice of the Peace, on examination of parties on oath, if the sum in dispute does not exceed £10. Any S. in H. absenting himself during the term of his contract, written or verbal, is guilty of a misdemeanour, and is liable to be sent to prison with hard labour for three months, or to be mulcted in part of his wages. The law applies to women-servants also.

Husch, the chief town of the circle of Faltchi, Moldavia, near the border of Bessarabia, 8 miles W. of the Pruth, and 40 S.E. of Jassy. It was founded over 400 years ago by Hussites, is the seat of a Greek bishop, and has a trade in corn and wine. Here the Russians and Turks signed the treaty of 1701. Pop. 18,000.

Hushiarpur', the chief town of the district of the same name, in the Province of the Punjaub, British India, 90 miles E. of Lahore, and close by the old city of Hurrianah, has a special manufacture of white damask cotton cloth. Pop. (1868) 13,022. —The *district* of H., which lies in the Jullundhur Doab, between the Sutlej and Beas rivers, has an area of 2086 sq. miles; pop. (1868) 938,890. The crops are wheat, Indian-corn, barley, rice, cotton, and sugar-cane.

Hus'kisson, William, an English statesman and financier, was born at Birch Moreton, Worcestershire, March 11, 1770, and educated in Paris. He was a member of the 'Societé de 1789,' and took great interest in its commercial discussions. He became Secretary to the British Parisian ambassador, and on his return to England, Under Secretary of State in 1795. He was appointed Secretary of the Treasury (1804), Commissioner of Woods and Forests (1822), President of the Board of Trade (1822), Colonial and War Secretary (1827), and Foreign Secretary (1828), and represented Morpeth, Liskeard, Harwich, Chichester, and Liverpool in succession. He was killed by a locomotive engine on the opening of the Liverpool and Manchester line, September 15, 1830. H. had a profound financial knowledge, and his speeches (published with a biographical memoir in 1831 in 3 vols.) have never been surpassed for clearness of reasoning and mastery of detail. His statesmanlike measures for removing restrictions on commerce, particularly a bill carried in 1823, were without doubt the great precursors of the Free Trade movement.

Hussars' (Magyar, from *Husz*, 'twenty,' every twenty families being obliged to furnish one man), a species of light cavalry, of which in 1877 there were thirteen regiments in the British army. They originated in Hungary, and in the 17th and 18th centuries regiments of the kind were formed in France, Prussia, Russia, and England. They are armed with sabres, pistols, and carbines or rifles, and are adapted for close-fighting, scouring the country, and harassing the enemy.

Huss'ites (properly **Husites**) were the warlike adherents of Hus (q. v.). Hus was not merely a martyr to his faith, but was amongst all ranks and classes in Bohemia regarded as a national hero. In September 1415 a national assembly defied the Council of Constance, and resolved that every Bohemian proprietor might have the doctrines of Hus preached throughout his territories. The formation of a Catholic League intensified the excitement. Soon thousands were pledged not merely to take arms for the vindication of Hus's teaching, but to take revenge on the minions of a bloody church and a treacherous emperor. Amongst the H. two parties were formed. One, headed by the city of Prag and its university, were willing to be content with a few moderate concessions, including the use of the cup in communion to the laity, and from this circumstance are generally called *Calixtines*. The other party, known as *Taborites*, from their chief stronghold, the hill town of Tabor, went to an extreme in their opposition to all the existing arrangements in the Catholic Church, and soon ran into apocalyptical fanaticism. The latter party was headed by Nicolaus of Husinecz and John Ziska, and in 1419 fought a bloody battle at Prag. Under Ziska, the Taborites sacked monasteries and churches, and exercised great cruelties on priests and monks; and after the death of the king, Wenzel, obtained the support of the moderate H. in resisting the claim of the hated Emperor Sigismund to the Bohemian crown. For fifteen years Sigismund was unable to make head against the H., and as the various parties were united only against the common enemy, Bohemia was all that time in a state of anarchy. The result has been that in Franconia, Saxony, Silesia, and other Catholic districts of Austria, the name of the H. is still remembered with a shudder. Not only in great battles such as Deutschbrod (1422), but in smaller engagements, Ziska continually routed the imperial troops. After his death in 1424, the mass his energy and military success had held together broke into smaller parties. Those who held most closely to Ziska's aims called themselves the 'orphans,' and formed a middle party between Calixtines and Taborites, while the larger party of the Taborites took Procop as their commander. The new leader brilliantly displayed his capacities in the decisive victories at Miesz and Tachau in 1427 and 1431, gained over greatly superior numbers of imperial troops. Meanwhile the Calixtines had obtained the upper hand in the councils of the nation, the moderate H. saw their way to a compact with the Catholic party, and, united with the latter, entirely defeated the recalcitrant Taborites at Böhmischbrod, 30th May 1434, and for ever broke their strength, though as late as 1453 the Taborites maintained themselves as a party. After a final defeat in that year, the Taborites disappear in the *Bohemian Brethren* (q. v.). The victorious Calixtines, after certain concessions afterwards faithlessly withdrawn, agreed in 1436 to recognise Sigismund as King of Bohemia; and ultimately, in 1575, such as had not been

crushed into conformity with the Catholic Church, united themselves with the Bohemian Brethren. See Palacky, *Geschichte von Böhmen;* and Bezold, *König Sigismund und die Reichskriege gegen die Husiten* (Munich, 1877).

Hus'tings (lit. a 'house court;' Old Eng. *hus*, 'house,' and Dan. *ting*, a 'court of justice'), is a court held before the Lord Mayor, Recorder, and Sheriffs of London. It is the Supreme Court of the city.

Hu'sum, a seaport in the province of Slesvig-Holstein, Prussia, on the North Sea coast, 22 miles W. of Slesvig. It has some industry in tobacco, leather, and spirits, and wool and cattle markets. Pop. (1875) 5765.

Hut, in military affairs, houses used instead of tents, formed either of wood, when they are called *log-huts* or *frame-huts*, the latter being more carefully constructed, or of clay, when they are called *pisé-huts*, the last being common in France. Huts vary greatly in size, being sometimes made to hold only one man, sometimes to hold 100 men.

Hutch'eson, Francis, a Scottish metaphysician, was born 8th August 1694, at Drumalig, near Saintfield, county Down. He was the son of a Presbyterian minister of Ballyrea, whose father had crossed from Scotland during the earlier persecution. After a private training in scholasticism, he studied at Glasgow under Gershom Carmichael (called by Sir W. Hamilton 'the founder of Scottish philosophy') and the heretical John Simson, one of the fountains of 'New Light.' The influence of Hoadley and Clarke was at this time considerable, and when in 1716 H. accepted a charge at Magherally, his preference for natural over Calvinistic theology was so distasteful to his flock that he left the pulpit and opened a school at Dublin. In 1725 he produced his *Inquiry into the Original of our Ideas of Beauty and Virtue*, which he defended against Philaretus, a son of Bishop Burnet, in the *London Journal* of 1728, in which year he also published *An Essay on the Nature and Conduct of the Passions and Affections, with Illustrations of the Moral Sense.* In 1729 he succeeded Carmichael at Glasgow, where he lectured on natural religion, morals, jurisprudence, and government, and read and expounded the great moral philosophers of Greece and Rome. His inaugural address was *De Hominum Socialitate.* At this time H., Simson (the mathematican), Dunlop (Greek), and Leechman (theology), attracted many students from Ireland and England to Glasgow, where the printers Foulis were also established. Among H.'s pupils was Adam Smith. With Leechman H. laboured 'to put a new face on Scotch theology.' In 1735 he wrote a pamphlet against patronage. He also published in Latin educational compendiums of logic and metaphysics, and helped Moore to translate and edit the *Meditations* of Antoninus. In 1745 he was nominated by the Edinburgh Town Council to the Chair of Moral Philosophy there, which he declined. He died 8th August 1746. In psychology H. was, on the whole, of Locke's school. He did not attempt the analysis of the primary qualities. But interest chiefly attaches to his theory of the moral sense, the sensations of which he keeps apart from (1) the pleasures and pains of imagination (arising from harmony, novelty, grandeur, &c.); (2) the pleasures and pains of sympathy; and (3) the sense of honour founded on the approbation and disapprobation of others. The pleasure of conscience caused by the contemplation of whatever tends to the happiness of others is a primitive feeling. He omits altogether the element of responsibility or obligation. He illustrates skilfully the growth of secondary desires, and defends the underived existence of disinterested feeling. H. was not a profound, but a clear and graceful writer. He did much to form a rational moderate party in both college and church. See the *Life of H.* by Dr. Leechman, prefixed to an edition of his *System of Moral Philosophy*, published by H.'s son in 1755.

Hutch'inson, Anne, founder of a sect of Antinomians in America, was born at Alford in Lincolnshire, England, in 1591, and emigrated to Boston in 1634. Her views were opposed by the clergy of Massachusetts, and she was banished from the State in 1637. She removed to Rhode Island, and in 1642 to the Dutch territory, where she was killed by Indians in 1643.

Hutchinson, John, founder of the school of cabalistical interpreters of Scripture known as *Hutchinsonians*, was born in 1674 at Spennithorne, in Yorkshire. He was employed as steward by the Duke of Somerset, and afterwards received a comfortable sinecure through the influence of the same noble patron. In a curious work entitled *Moses's Principia*, of which a fresh part appeared in 1724, H. assailed the Newtonian theory of gravitation on the authority of Scripture; and till the end of his life continued to publish occasional volumes, in which the attempt is made by fanciful treatment of the texts, words, and root syllables of the Hebrew Scriptures, to extract thence a complete system, not merely of theology and philosophy, but of astronomy and natural history. Amongst the followers of H., who was a mere ignorant dabbler, possessed neither of learning nor ability, were not a few men of high academical and ecclesiastical position. *The Philosophical and Theological Works of the Late Truly Learned John H., Esq.*, appeared in 1748 in 12 vols.

Hutchinson, Lucy, a Puritan lady, who has won a place in literature by an admirable memoir of her husband, Colonel John Hutchinson, was born 29th January 1620, and married in 1638. Colonel Hutchinson was a member of the high court of judiciary that sentenced Charles I. to death. At the Restoration he was arrested, and died a prisoner in Sandown Castle, 11th September 1664. His wife survived him many years. The work which has made both herself and her husband famous was not published till 1806. In a graceful and appreciative review, Lord Jeffrey compares her to 'the Valerias and Portias of antiquity.'

Hutt'en, Ulrich von, the fiery champion of *humanism*, indefatigable in his efforts for freeing the German nation from the yoke of Italian ecclesiasticism, was descended from an ancient knightly family in Franconia, and was born at Steckelberg, in Hessen, 22d April 1488. He escaped from the monastery of Fulda and the monastic life to which he was destined by his family, and at the universities of Erfurt, Frankfurt on the Oder, Greifswald, and later in Italy, he was won to the cause of the new classical learning—the *Renaissance* of pure literature. The aquaintance made with Aquinas (q. v.) at Cologne and with canon law at Pavia and Bologna only provided material for displaying his contempt for the old scholasticism. His sojourn in Italy provoked him to intense abhorrence of the influence exercised on German affairs by the 'Roman tyrants,' as he called the popes. A family feud with the Duke of Würtemberg raised his ire against the arbitrary power of the minor German princes. He took up with zeal the cause of Reuchlin against the Dominicans; in the biting satire of the *Epistolæ Obscurorum Virorum*, at least in the second part, a large share must unquestionably be ascribed to H. When Luther adopted a position of decided hostility to Rome, H. greeted him as a fellow-worker, though conscious that their aims were almost as different as the methods by which they sought to gain them. H.'s zeal was less for the purity of doctrine or for the promotion of piety than for the restoration of political and intellectual freedom and unity in Germany; but he was keenly persuaded that the papal system was contrary to the spread of Christianity and hostile to human freedom. After 1520 H. was deeply engaged in intrigue for securing the ends he sought by military combination of well-affected nobles, cities, and peasants; and found in Franz von Sickingen a captain after his own heart. H.'s inseparable companions through life, poverty, sickness (in great measure the result of dissipated habits), and bitter hostilities, followed him to Switzerland, where, in 1523, he was working for Sickingen's cause. Here he engaged in a bitter controversy with Erasmus, whom he regarded as an apostate from the cause he had once done so much to forward, when, hearing of Sickingen's defeat and death, he died broken-hearted on the island of Ufenau in the Lake of Zurich, 29th August 1523—a man not without many faults, but a brilliant example of self-devoting, consuming zeal for truth and right. A collected edition of H.'s works, in 5 vols., was published by Böcking in 1859-62. See Strauss's *Ulrich von H.* (Leips. 2 vols. 1857).

Hutt'on, Charles, an English mathematician, was born at Newcastle-on-Tyne, August 14, 1737. He was almost entirely self-taught, and conducted with success a school in his native town till 1773, when he was called to the Chair of Mathematics in the Royal Military Academy at Woolwich. In 1775 he was charged by the Royal Society with the duty of deducing the earth's mean density from the observations made by Maskelyne upon the attraction of Schiehallion. He enriched the *Philoso-*

phical Transactions with many valuable papers, and published his famous *Mathematical Tables* in 1785. His *Tracts on Mathematical and Philosophical Subjects* (3 vols.) appeared in the succeeding year, and the *Compendious Measurer* and the *Elements of Conic Sections* in 1787. His other chief works are *A Mathematical and Philosophical Dictionary* (1795–96), *A Course of Mathematics* (3 vols. 1798–1801), *Recreations in Mathematics and Natural Philosophy* (translated, with additions, from the French of Montucla, 4 vols. 1803), and, together with Shaw and Pearson, an *Abridgment of the Philosophical Transactions* (18 vols. 1804–9). While at Woolwich, his attention was naturally attracted to Gunnery (q. v.), and his experiments with Robin's ballistic pendulum form perhaps his most important contributions to practical science. In 1806 his health obliged him to resign his post, and retire on a government pension of £500 per annum. H. died in London, January 27, 1823.

Hutton, James, a Scottish geologist, was born at Edinburgh, June 3, 1726. He studied medicine at Edinburgh, Paris, and Leyden, where he took his doctor's degree in 1749. On his return in 1750, he worked as a practical farmer for some time; but the love for chemistry, which he had always shown, finally led him to the study of mineralogy. To better prosecute this science, he undertook journeys into England and through the North of Scotland, and ultimately became fully absorbed in the much wider science of Geology (q. v.), which was then in its infancy. His discovery of granite veins forms an important event in the progress of geology, and his *Theory of the Earth* (communicated to the Royal Society of Edinburgh in 1777, published 1795) entitles him to a foremost place among modern geologists. It roused a bitter controversy, and was vigorously attacked by the Wernerians. His *Theory of Rain*, which is now recognised as generally accurate, was criticised and combated by De Luc. H. died March 26, 1797.

Hux'ley, Thomas Henry, was born at Ealing, Middlesex, May 4, 1825. In 1842 he entered the Medical School of Charing Cross Hospital, and in 1845 passed the first M.B. examination at the University of London, especially distinguishing himself in anatomy and physiology. In the succeeding year he accompanied H.M.S. *Rattlesnake* to the Southern Seas as assistant-surgeon, investigated with great success the fauna of those regions, and communicated to the Royal Society several important papers, the first of which (1849) bears the title *On the Anatomy and Affinities of the Family of the Medusæ.* He returned home in 1850, was elected a Fellow of the Royal Society in 1851, and succeeded Edward Forbes in the Chair of Natural History in the Royal School of Mines in 1854, a post which he still holds. In 1870 he presided at the meeting of the British Association, was elected Lord Rector of Aberdeen University in 1872, and lectured on natural history at Edinburgh University during the summer sessions of 1875–76 in room of Sir Wyville Thomson, then absent on the *Challenger Expedition.* H. is universally recognised as one of the foremost biologists of the day. All his writings exhibit his wide grasp of the facts and principles of the science in which he labours, as well as his true philosophical acumen in detecting essential relationships between different animal groups as a basis for generalised conceptions; while as a teacher and expounder he stands pre-eminent in his department. His rare powers are well shown in his classification of the whole animal kingdom, but especially in the elucidation of the comparative anatomy of the vertebrata. His extension of Darwin's theory of natural selection, and the great impulse which he has given to the doctrine of evolution, merit particular attention. His chief works are *Man's Place in Nature* (1863), *Lectures on Comparative Anatomy* (1864), *Lessons in Elementary Physiology* (1866, 2d ed. 1868), *An Introduction to the Classification of Animals* (1869), *Lay Sermons, Addresses, and Reviews* (1870, 2d ed. 1871), *Manual of the Anatomy of Vertebrated Animals* (1871), *Critiques and Addresses* (1873); and, with W. T. T. Dyer, the article *Biology* in the *Encyclopædia Britannica* (9th ed. vol. iii. 1875).

Huy, a fortified town in the province of Liege, Belgium, at the confluence of the Hoyoux and the Maas, 17 miles S.W. of Liege by rail. It lies in a wild, hilly district, has a Gothic church of Notre Dame dating from 1311, and carries on a large trade in the coal and iron from the neighbouring mines. The former abbey of Neufmoustier (*Novum Monasterium*), was founded at H. by Peter the Hermit after the first Crusade. H. was taken by Marlborough and Coehoorn in 1703. Pop. (1874) 11,420.

Huy'ghens van Zuglichem, Christian, a celebrated natural philosopher, was born at the Hague, in Holland, April 14, 1629. In 1645 he entered the University of Leyden as a law student, devoting most of his energies, however, to the study of mathematics. He studied later at Breda, and in 1651 published his first work, *Theoremata de Quadratura Hyperbolis, Ellipsis, et Circuli, ex dato Portionum Gravitatis Centro*—a work which placed him among the first mathematicians of the age. In 1655 he discovered, by means of a telescope constructed by himself, the fourth satellite of Saturn, and later proved the existence of the ring. His results were published in his *Systema Saturninum* (1659), where also is described for the first time the *micrometer*, an invaluable instrument in astronomical research. About this time he applied the pendulum to the regulation of clocks—undoubtedly the greatest of his practical inventions, which forms the subject of his important treatise *Horologium Oscillatum* (1658). In 1660 he visited England, and in 1666 settled in Paris, where he remained till 1681, when he returned to his native town. In 1690 he published his famous treatise on light, in which he proved, upon the undulatory hypothesis, by most beautiful geometrical constructions, not merely the ordinary laws of reflection and refraction, but also the hitherto inexplicable phenomenon of double refraction. Another of his optical discoveries is the polarisation of light by reflection. H. died at the Hague, June 8, 1695. S' Gravesande published his *Opera Varia* (4 vols. 1724), and, as a supplement, *Opera Reliqua* (2 vols. 1728). His unpublished manuscripts were collected under the title *Opera Posthuma* (1700). See the *Vita Hugenii* prefixed to his *Opera Varia.*

Huy'sum, Jan van, an exquisite Dutch painter, was born at Amsterdam in 1682. His father, Justus H., also a painter, carefully educated him in his own branch of the art, viz., landscape painting, which Jan cultivated with great success. Latterly, however, he betook himself to flower and fruit pieces, and in this style he reached the highest degree of excellence. Nothing can surpass the delicacy, mellowness, and natural beauty of his work. In all he executed, it is said, between 1000 and 1400 pictures. The best specimens of his genius are in the galleries of Vienna, Munich, Dresden, and St. Petersburg. H. died at Amsterdam in 1749. His three brothers, Justus van H. (ob. ætat. 22), Nikolaus van H., and Jakob van H. (died in London 1740), were also painters of some note.

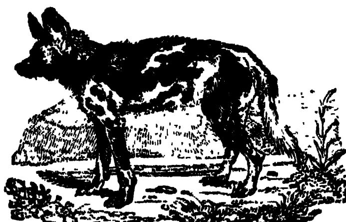
Hu'zara (*Hazara*), the most northerly district of British India, province of the Punjaub. Area, 3000 sq. miles; pop. (1868) 367,218. It is bounded on the W. by the Indus; and the country is mainly mountainous. Snow falls as low as 4000 feet. The crops are maize, wheat, and barley, and there are large flocks of sheep and goats. The chief town is H. or Abbotabad, 125 miles E. of Peshawur, where there are cantonments for 1500 men. In 1857 the sepoy regiment mutinied, and was pursued and cut to pieces among the mountains.

Hwang-Ho. See HOANG-HO.

Hy'acinth, a mineral variety of the species *Zircon* (q. v.), occurring in grains in Ceylon and several European localities, such as Auvergne and Bohemia.

Hyacinth, a plant to which frequent allusion is made by the Greek poets, but which, from the vague way they use the names of flowers, it is impossible to identify. As now understood, H. is the genus *Hyacinthus.* This genus belongs to the section of the natural order *Liliaceæ*, with united perianth segments (*gamopetalous*), capsular fruit, and racemose inflorescence, and contains about thirty species, of which three-fourths are natives of Persia, Asia Minor, Syria, and countries bordering the Mediterranean. From one of these, viz., *H. orientalis*, the various coloured single or double hyacinths of the garden and the greenhouse have been produced. Grown indoors in H.-glasses they form an enlivening and favourite ornament in the early months of the year. Some six species of H. are peculiar to our Cape of Good Hope colonies. The grape-H. belongs to another genus named *Muscari*, and the popular name originates from the small roundish purple flowers being arranged in clusters on the top of

the stalk (scape), something like grapes in a bunch. There are about twenty species, one of which is possibly a native of Britain; several of them are grown in gardens. The wild or wood H. or bluebell is a *Scilla*, in which genus the petals or segments of the perianth are *not* united, but free.



Hyacinthus orientalis.

Hy'acinthe, Père (Charles Loyson), a Catholic schismatic, was born at Orleans, 10th March 1827, studied at the Academy of Pau, of which his father was rector, entered the seminary of St. Sulpice (1845), migrated thence to Paris (1846), and received priest's orders, 17th June 1851. Successively Professor of Philosophy at Avignon, and of Theology at Nantes (1854), he exchanged the latter post for the cure of the church of St. Sulpice, and four years later entered first the Dominican, then the Carmelite order, accomplishing his noviciate at Branssay. After preaching at Lyon, Bordeaux, &c., in 1864 H. came to Paris, where, as superior of the Carmelite monastery at Passy, he delivered some eloquent courses of sermons at the Madeleine and Notre Dame (1865-69). His oratory, however, was better than his orthodoxy, and a speech addressed to the International League of Peace, in which he classed the Jewish, Catholic, and Protestant religions as 'the three great religions of civilised peoples,' caused his suspension, July 1869. This H. answered by a manifesto (September 20) appealing to the forthcoming Œcumenical Council; but at the same time renouncing his vows, he was excommunicated, and shortly after left Paris on a visit to the United States. In September 1871 he appeared at the 'Old Catholic' Congress at Munich, and on September 2, 1872, contracted a civil marriage with an American lady, the widow of Mr. E. Meriman, who has since borne him a son. Elected, April 1873, a curé of the 'Liberal Catholics' at Geneva, he resigned the post in 1874, on the ground that 'Liberal Catholicism was neither Liberal in politics nor Catholic in religion,' and has since officiated in a church of his own establishing. H. has lectured occasionally in England, where he numbers among his friends Mr. Gladstone, Dean Stanley, and Professor Jowett.

Hy'ades (Gr. 'rainers,' from *hyein*, 'to rain,' Lat. *Pluviæ*), five stars clustered in the face of the constellation Taurus, the rise of which simultaneously with the sun was thought by the ancients to portend rainy weather. The story connected with them is variously given.

Hya-Hya. See Cow-Tree.

Hyæ'na (*Hyæna*), a genus of Carnivorous mammals included in the family *Hyænidæ*, and possessing six incisors, two canines, and two molars in each jaw; eight premolars existing in the upper and six in the lower jaw. All the feet possess four toes, and the tail is short. The body exhibits a singular conformation in that it slopes in a very marked manner from the shoulders to the hind quarters. These animals are cowardly and timid, and appear chiefly to subsist on the carrion left by other animals. The H. will only attack smaller animals, or press larger animals when the latter are solitary, and when the H. is supported in the attack by numbers of its own kind. These animals exist in Asia and Africa, and several very distinct species are known to zoologists. The striped or crested H. (*H. striata*) attains a length of 4 or 5 feet. Its colour is greyish brown, but it may be readily recognised by the black stripes which mark the sides and limbs. The ears are long and pointed. The brown H. (*Crocuta rufa*) derives its name from the general brown line of its fur. The spotted H. (*C.* or *H. maculata*) is, perhaps, the most familiar of these animals. It is common in S. Africa, and is named the 'tiger wolf,' from its peculiar marked ferocity; whilst the name 'laughing H.' has been given to this animal from its strange cries. Its average length is 5½ feet, and its height at the shoulder 2½ feet. The head is short and the muzzle broad; the colour being brown, marked in an irregular manner with black spots. The tail measures about 16 inches; and there is a kind of rough mane on the back and withers. The power of the jaws and jaw-muscles in the H. is well exemplified by the ease with which these animals split up the largest bones into splinters.

Hunting Hyæna.

Hyalone'ma, a very peculiar genus of animals, known popularly as the 'glass-rope zoophyte,' and apparently composed of two distinct animal forms closely united together. The organism consists (1) of a cap-shaped sponge (*Carteria*), to which is attached (2) a long twisted coil of flinty or siliceous fibres; and encrusting these fibres is found (3) a colony of little polypes, resembling the sea-anemones in their essential nature. *H. Sieboldii* was first brought from Japanese seas, but allied species have been dredged elsewhere, especially off the coast of Portugal. The peculiar nature of the H. has formed a puzzle to zoologists. By some it has been placed among the *Zoantharia* in the *Cœlenterate* sub-kingdom of animals, from the consideration that the little polypes manufacture the flinty coil. But as no cœlenterate are known to secrete a *flinty* coral or hard parts, this view has been rejected by others, who maintain that the true artificer of the flinty coil is the sponge; the polypes in this latter view being regarded as parasitic. On the whole, this latter opinion—supported by Wyville Thomson, Loven, &c.—is the most probable.

Hyberna'tion. See Hibernation.

Hyb'la, three towns in Sicily, from one or other of which came the honey so often alluded to by ancient poets, namely, *H. Major*, on the S. slope of Ætna; *H. Minor*, or *Megara Hyblæa*, founded on the E. coast by Dorians of Megara in Greece in 728 B.C., under Syracuse from the earlier part of the 5th c. B.C., but insignificant after its sack by the Romans during the second Punic War; and *H. Heræa*, in the S., between Agrigentum and Syracuse.

Hyb'odus (Gr. 'hump-toothed'), a genus of extinct fishes belonging to the order *Elasmobranchii* (q. v.), and to the division *Cestraphori* of that order. H. remains occur plentifully in Triassic and Oolitic rocks, and less abundantly in the Chalk series. The teeth are shark-like in conformation, but are somewhat blunted in shape. Each tooth includes a central cone, having smaller or secondary cones on either side. The fossil fin species, or 'ichthyodorulites' of H., are grooved longitudinally, and are toothed on their hinder edges. The teeth and fin species form, in fact, the only portions of these fishes which have been preserved in a fossil state.

Hy'brid (from Gr. *hybris*, 'wanton excess,' 'licentiousness'), the name given to the progeny of animals assumed or believed to be distinct *species*. Thus the progeny of a male horse and female ass is a H. named the Hinny (q. v.), that of the mare and the he-ass, a H. named the Mule (q. v.). Here the distinctly *specific* nature of the horse and ass is assumed, and, in point of fact, is generally admitted. In determining the nature of any animal presumed to be a H., it is evident the chief test must rest with the determination of the truly and distinct specific nature of the parents. The definition of a species of animals or plants is by no means an easy matter, since the ideas of naturalists regarding species have greatly altered within the past few years. A species is not now regarded as the invariable and stable quantity which the older zoologists and botanists defined it to be; the modern tendency in biological speculation is to regard each species as capable of *varying* to a greater or less extent. A species thus produces *varieties*, and when distinct *varieties* interbreed, the progeny are not named hybrids but *mongrels*. To understand the difficulties which beset the determination of hybrids, it is necessary to bear in mind that each species may be regarded from two points of

view—(1) in reference to structure, that is, *morphologically*, and (2) in reference to functions, that is, *physiologically*. It is clearly the physiological idea of species which is concerned in the production of hybrids, since the fertility of two forms is a matter to be decided from a functional or physiological point of view. A general survey of the animal and plant creations would show us that as a rule distinct species of animals and plants present little or no tendency to interbreed. When two individuals representing two distinct species do interbreed, the species will be found almost invariably to be near neighbours, and to possess a very close structural and physiological relationship. The further we go from the type of the genus the less likelihood is there of hybrids being produced. Hybrids have been thus readily enough produced by 'crossing' the horse and ass as already remarked, and by interbreeding the sheep and goat. It is worthy of remark, however, that there appears to exist a preference, as it were, on the part of one or other *sex* for the successful production of hybrids. Thus in some cases (exemplified by the horse and ass) the male of one species when crossed with the female of the opposite species produce a more perfect H. than when the female of the first species is crossed with the male of the second. The male ass and mare produce a stronger H., and one more likely to be fertile or to produce young, than the offspring of the stallion and the female ass. The he-goat united with the ewe produces a physiologically more perfect H. than that resulting from the union of the ram with the she-goat, the greater physiological perfection of the former H. being evinced by its capability of producing young. Other cases of hybrids have been proved to occur indiscriminately between the horse, ass, and zebra. The dog breeds freely with the wolf, and the resulting hybrids are by no means sterile; the lion and tiger have also produced a H. progeny. The offspring of the swan and goose are fertile, and pheasants have been successfully bred with allied species. Rabbits and hares are perfectly prolific *inter se*, and among fishes hybrids have been artificially produced by fertilising the eggs of one species with male fluid from another. In plants the production of first hybrids takes place very frequently, but the degree of fertility which these hybrids may exhibit has not been definitely ascertained. The plant species is if anything more elastic in its nature than the animal species, in so far at least as the production of first crosses are concerned. Mr. Darwin remarks that the prevailing idea among naturalists is, 'that species, when intercrossed, have been specially endowed with sterility in order to prevent their confusion;' yet he adds, 'although I know of hardly any thoroughly well authenticated cases of perfectly fertile H. animals, I have reason to believe that the hybrids from *Cervulus vaginalis* and *Reevesii*, and from *Phasianus colchicus* with *P. torquatus* are perfectly fertile. M. Quatrefages states that the hybrids from certain moths (bombyx, cynthia, and arrindia) were proved in Paris to be fertile *inter se* for eight generations.' The result of Mr. Darwin's considerations tends to show that every degree of fertility probably exists in H. races, ranging indeed 'from zero to perfect fertility.' At the same time, the question regarded generally may be summed up by stating that sooner or later the fertility of hybrids becomes impaired. The conditions which produce these forms may be competent to continue their fertility for several generations, but no evidence is at hand to prove that this fertility is permanent, or that any one race of plants or animals represents the results of permanent hybridisation originally induced between two distinct species.

Hybrid Disease. The only instance of H. D. which has been described is Rötheln or Rubeola (q. v.), a disease developed from the combined poisons of two fevers, measles and scarlatina. Dr. Kütner, of Dresden, states that he has seen occasionally in the same individual portions of the skin presenting the scarlatina eruption, while in other parts the eruption of measles was to be seen, and cases have also been described in which the eruption was hybridous. It is possible that an individual may suffer from two diseases of the zymotic type at the same time; but the possibility must also be admitted of the existence of H. D., and the theory receives confirmation from recent investigations regarding the Germ Theory of Disease (q. v.). It is probable that Dengue (q. v.) belongs to the class of H. D.

Hyde', a town of England, in Cheshire, on the river Tame and the Peak and Forest Canal, 7 miles E. of Manchester by rail. It has extensive cotton-mills, printworks, iron foundries, and machine factories. In the vicinity are numerous collieries. H. is an old market-town, but its thriving industries are of recent date. Pop. (1871) 14,223.

Hyde, Edward. See CLARENDON, EDWARD HYDE, EARL OF.

Hy'der (*Haidar*) **Al'i**, the most formidable enemy that the British ever encountered in India, either in diplomacy or war, was born in 1728, and first served as a trooper under the Hindu Rajah of Mysore. He usurped the throne in 1759, and founded a Mohammedan empire over the entire S. of the Peninsula, except the Carnatic. H. headed a native league to expel the British from India, and also allied himself with the French. His first war with the British lasted from 1767 to 1769, and was terminated by a peace dictated by himself under the walls of Madras. He next became involved with the Mahrattas, but after a severe defeat maintained his power. The second war with the British broke out in 1779. It is memorable for the devastation of the Carnatic, and for the victory of Sir Eyre Coote at Porto Novo in 1781. H. A. himself died 7th December 1782, before the termination of the war, bequeathing his dominions and his policy of enmity against the British to his son, Tippoo Sahib.

Hy'dnum, a large genus of hymenomycetous fungi, distinguished by the hymenium consisting of prickles projecting from the pileus. *H. repandum*, a common species in woods, is good eating if properly cooked.

Hy'dra (Gr. 'water snake'), a monster fabled in ancient times to have infested the marsh of Lerna near Argos. It was the offspring of Typhon and Echidna, or of the Titan Pallas and Styx, and had nine heads, which, as Hercules (q. v.), who had been sent to attack it, struck them off with his club, were succeeded by twice as many more. At last the hero, aided by his servant Iolaus, burned off the heads, burying the middle one, which was immortal, under a huge rock, and poisoned his arrows by tinging them with the blood of the H. As 'killing the H.' was a Greek proverb for labour in vain, so the term H. is often applied to some irrepressible pest, *e.g.*, the 'H. of revolution.'

Hydra, an island of Greece, 11 miles long and 3 broad, off the eastern peninsula of the Morea, from which it is separated by a strait 5 miles wide. Area, 45 sq. miles; pop. (1871) 11,684, mostly Albanians. It is included in the nomarchy of Argolis and Corinth, and is barren and hilly (1800 feet high), destitute of wood and wells. A strongly-fortified town, also called H., on the N. shore, is one of the most beautiful in Greece, and has a good harbour, some cotton and silk industries, shipbuilding, &c. Pop. 7380. The island, uninhabited in ancient times, was settled by Albanians and Greeks who fled hither from Turkish oppression in the 15th and 16th centuries. Before the War of Liberation, H. was regarded as the richest island in this archipelago. The Hydriotes played a prominent part in the war, and are still admirable sailors. Much of their trade has found its way to more advantageous ports since 1825.

Hydra, or **Common Fresh-Water Polype**, a little animal attaining a length of a quarter of an inch, found in fresh-water ponds and ditches. The common species, *H. viridis*, receives its green colour from the development of *chlorophyll*. *H. fusca*—the 'long-armed H.'—of a brown colour, is so named from the possession of long arms or tentacles which surround the mouth. The body of a H. is simply a little tube, composed of two layers or tissues (*ectoderm* and *endoderm*), attached to weeds, &c., by one extremity, the *hydrorhiza*, whilst at the free extremity or mouth surrounded by tentacles, from four or five to ten or more are found. The tentacles capture the prey, consisting of water-fleas and other minute organisms, and along with the body-tissues are richly provided with stinging-cells named *cnidæ* or thread-cells. These thread-cells contain a fluid and a thread or filament which lies coiled up within the interior of the cell. On being irritated in any way, the thread-cell ruptures, the fluid escapes, and the thread is everted, and coming in contact with the tissues of the prey, serves to paralyse and to kill the latter. The bases of the threads of H.'s thread-cells are armed with three little recurved hooks. The simple interior of the body-

cavity serves as a digestive system, and the *cilia* or vibratile filaments lining the endoderm serve to circulate through the body the products of digestion. *Reproduction* in H. may be performed in three ways. Trembley of Geneva, in 1744, published his researches on the H. and showed that these polypes might be artificially divided in various ways, with the result of producing new hydræ by the division of a single individual. This process may therefore be termed one of *artificial fission*. Reproduction by *gemmation* or *budding* also takes place in the warmer months of the year, young buds growing on the side of the parent body, and gradually growing into the likeness of the latter. These buds, however, drop off sooner or later to seek a lodgment and begin life on their own account. The H. also reproduces its like by means of *sexual* reproduction. Eggs are produced in an *ovarium* situated near the base of the body, *spermatozoa* or *male* elements being developed in *spermaria* at the base of the tentacles. After fertilisation the eggs undergo segmentation, and finally the *blastoderm*, or germinal membrane, gives origin to the two layers of the body of the H., and a mouth and tentacles being developed, the adult form is matured. The H. forms the type of the class *Hydrozoa* of the *Cœlenterate* sub-kingdom of animals, the class being represented by zoophytes, jellyfishes, and the like.

Hy'drabad (*Haidarabad*, 'the city of Haidar, or the lion'), the name of two important towns in India. 1. The capital of the Nizam's Dominions (q. v.), in the centre of the Deccan, on the Mussi river, a tributary of the Kistna, 962 miles or 91 hours by rail S.W. of Calcutta, and 449 miles or 27 hours E. of Bombay. It is a walled city, the third largest in India, containing, with its extensive suburbs, a population of 450,000 souls. H. was founded in 1589, to supersede the old capital, Golconda, 8 miles distant, and it contains many handsome buildings, palaces, mosques, and tanks. The British Residency is also a fine structure on the opposite side of the river, here crossed by a stone bridge of nine arches, erected by a British officer in 1831. The cantonments of Secunderabad lie about 4 miles N. H. is famous for a permanent horse-market, and for its fruit-gardens. The large Mohammedan population is disposed to be turbulent. 2. Sometimes spelled Hyderabad for distinction, the chief town of the district of the same name in Scinde, just below the bifurcation of the delta of the Indus, 88 miles N.E. of Kurachi, with which it is connected by railway. Pop. (1872) 35,272. It was the former capital of the province, and is strongly built on an elevated plateau, with a conspicuous citadel. The cantonments, lying to the N. and W., contain about 1300 men and officers. In the neighbourhood are several handsome tombs of the Kalhora and Talpur Mohammedan dynasties, and the British Residency, where Outram was besieged in 1843. There are famous manufactures of gold, silver, and silk-embroidered fabrics, and of carpets; the former manufacture of arms and armour is now decayed. The trade is very considerable, the municipal tolls on certain articles alone realising £6000 per annum.—H. *district*, which borders the left bank of the Indus, has an area of 9053 sq. miles; pop. (1872) 721,947. Like the rest of Scinde, it forms a sandy desert wherever it is not irrigated by a network of canals. See *Gazetteer of Scinde*, by Mr. A. W. Hughes (Lond. 1874).

Hy'dracids, or Hy'drogen Acids, a name sometimes given to those hydrogen compounds which contain no oxygen, and which exhibit all the characteristics of true acids. Such, for instance, are hydrochloric acid (HCl), hydrobromic acid (HBr), hydrocyanic acid (HCN), &c. Some chemists regard the presence of hydrogen as necessary to the formation of an acid, so that all acids are H., and anhydrous acids (such as sulphuric anhydride, SO_3) have no real existence. See ACIDS.

Hy'dragogues. See CATHARTICS.

Hydrang'ea, a genus of showy shrubs, giving name to a suborder of the *Saxifragaceæ*. The best-known species is *H. hortensis*, a Chinese plant introduced into Kew Garden towards the end of the last century by Sir Joseph Banks. In the S. and S.W. of England it thrives well in the open air, and in those parts claims the attention of the stranger by its luxuriance and handsome appearance in the gardens of both rich and poor. Its almost globular clusters of flowers nearly hide the branches and foliage, and are like an enlarged mass of blossom of the guelder-rose or snow-ball tree, but they vary in colour from white to pink and a peculiar blue shade. In the greenhouse it looks somewhat coarse.

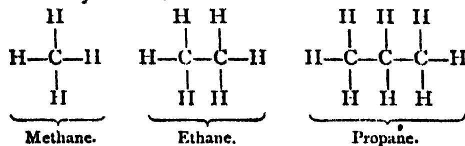
Hy'drates are salts in which water plays the part either of the base or of the acid. For instance hydrated sulphuric acid is really a salt, with water as its base; for its formula (H_2SO_4) differs from sulphate of potash (K_2SO_4) in nothing except in the substitution of the base K_2O for H_2O. The name H. should be more properly restricted to those salts which result from the action of a base upon water, which here acts as an acid. The best known of these salts are hydrate of baryta (H_2BaO_2), and hydrate of lime or slaked lime (H_2CaO_2).

Hydrau'lics may be regarded as the practical aspect of hydrodynamics. It considers the construction of machines which depend for their action upon the motion or pressure of fluids, and is intimately concerned with the collection and transporting of fluids for useful ends. So wide and varied are its latter applications that it is impossible here to enter into these, which are better considered under such headings as Breakwaters, Canals, Docks, Harbours, Pumps, &c. As indicated above, machines which derive their motive power from fluid agency fall to be treated under two headings—according as they depend on fluid-motion or fluid-pressure. To the former class belong the waterwheel, turbine (see WATER-POWER), Barker's Mill, and the more modern inventions known as *hydraulic engines*. These do not differ in general construction from ordinary steam-engines—the really distinguishing feature being the use of water instead of steam to drive the piston-rod. There is little question that our greatest possible source of hydraulic power is to be found in the energy of the tides, but the difficulty of utilising this immense store of energy has yet to be overcome. Hydraulic machines of the other class, those which act through fluid pressure, have assumed within the last twenty or thirty years a great practical importance, especially in the working of apparatus for loading and unloading goods, and for closing and opening docks. The hydrostatic principle involved is that of the Hydrostatic Press (q. v.), by means of which it is practically possible to exert a pressure so enormous as to be beyond the strength of the strongest materials. A number of different cranes may thus be set in operation by being simply connected mechanically with a powerful press worked by means of an ordinary steam-engine.

Hy'drides are compounds of metals or salt radicals with hydrogen. Arseniureted hydrogen (AsH_3), and antimoniureted hydrogen (SbH_3) are both well-known gases. Marsh gas is sometimes spoken of as the hydride of methyl (CH_3H), and similarly with the higher series of saturated hydrocarbons.

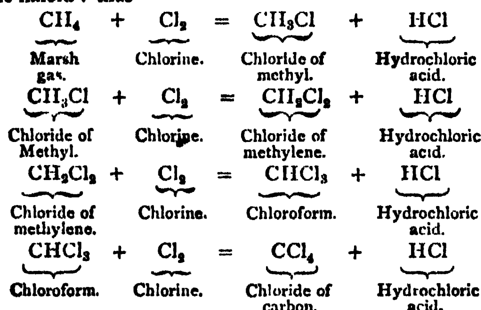
Hydrocar'bons, formerly called carbo-hydrogens, are compounds of carbon and hydrogen, and are perhaps the most numerous and important of all the carbon compounds. The number of these bodies has gradually increased with the progress of chemical science, and at the present moment amounts to hundreds. Besides possessing considerable theoretical interest, the H. are of immense practical value. They are employed for illuminating purposes, as sources of a great many colouring matters, as solvents of fats, resins, &c., for lubricating machinery, and for a host of other purposes. The limits of this article prevent us from entering into a detailed description of these interesting bodies, and from showing how the existence of so many compounds of two elements can be accounted for. We must content ourselves with explaining the plan which has been adopted in their classification, at the same time pointing out a few of the most important properties of the leading groups.

The classification of the H. depends upon the relative proportion of carbon and hydrogen which they contain. In each series there is a definite relation between the number of carbon and hydrogen atoms contained in its different members, and this relation may be expressed by a formula. Thus in the series of paraffines, or saturated H., the number of hydrogen atoms which any member contains is equal to twice the number of carbon atoms, plus two. The formula expressive of this relation is $C_n H_{2n+2}$, in which n = the number of carbon atoms. Each member of this series differs from the preceding member by containing an atom more carbon and two atoms more hydrogen. Such a series is said to be *homologous*, and it will be observed that all the other series of H. are homologous. The different series of H. differ from one another in containing less and less hydrogen, the formulæ



expressive of their composition showing that the quantity of hydrogen diminishes by two atoms in each case.' If, instead of vertical columns, the lateral columns be examined, it will be seen that they consist of H. containing the same number of carbon atoms, but fewer and fewer hydrogen atoms. A series, each term of which differs from the preceding term by two atoms less hydrogen, is called an *isologous* series.

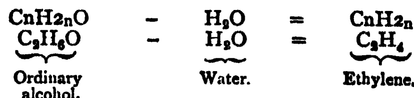
With regard to the nomenclature of the H., the system proposed by Hofmann is the simplest and most useful. In it a prefix indicates the number of carbon atoms, a vowel the number of hydrogen atoms.



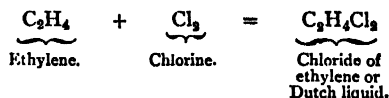
Saturated Series. CnH_{2n+2}. Paramnes.	Diatomic Series. CnH_{2n}. Olefines.	Tetratomic Series CnH_{2n-2}. Acetylenes.	CnH_{2n-4}.	CnH_{2n-6}. Benzol Series.
Methane, CH_4				
Ethane, C_2H_6	Ethene, C_2H_4	Ethine, C_2H_2		
Propane, C_3H_8	Propene, C_3H_6	Propine, C_3H_4		
Beutane, C_4H_{10}	Butene, C_4H_8	Butine, C_4H_6		
Pentane, C_5H_{12}	Pentene, C_5H_{10}	Pentine, C_5H_8	Pentone, C_5H_6	
Hexane, C_6H_{14}	Hexene, C_6H_{12}	Hexine, C_6H_{10}	Hexone, C_6H_8	Hexune, C_6H_6
Heptane, C_7H_{16}	Heptene, C_7H_{14}	Heptine, C_7H_{12}	Heptonel C_7H_{10}	Heptune, C_7H_8
Octane, C_8H_{18}	Octene, C_8H_{16}	Octine, C_8H_{14}	Octone, C_8H_{12}	Octune, C_8H_{10}
&c.	&c.	&c.	&c.	&c.

The above table contains the five most important groups of H. and a few of the more important members of each group, but besides the above there are a great many H. known, corresponding with groups containing very much less hydrogen. Thus styrol C_8H_8 belongs to a group the general formula of which is C^nH_{2n-8}. Napthalene $C_{10}H_8$ to one which is C_nH_{2n-12}. Whilst chrysene $C_{18}H_8$ is a hydrocarbon of a group containing so little hydrogen that its general formula is CnH_{2n-24}. A little consideration will show that only H. containing many carbon atoms can belong to groups so poor in hydrogen. Thus it is obvious that no H. containing twelve atoms of carbon could belong to the series C_nH_{2n-24}. The nomenclature of the H. not contained in the above table has up to the present time been arbitrary.

Saturated Series of H. or Paraffines.—These are called saturated because they cannot combine with any element or group of elements directly; a fact which is owing to the complete saturation of all the atomicities of each carbon atom, partly by neighbouring carbon atoms, partly by hydrogen atoms, as will be seen from the graphic formula of methane (marsh gas), ethane, and propane. See 'Atomicity' in Art. CHEMISTRY.

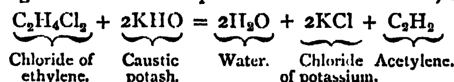


They are, however, acted on by chlorine and bromine, giving rise to substances in which their hydrogen is gradually replaced by the haloid: thus—

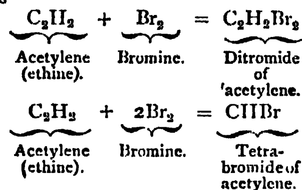


Nearly all the members of this series have been obtained from American petroleum by fractional distillation. Solid paraffine consists of a mixture of the higher members. Marsh gas is formed by the gradual decomposition of vegetable matter in presence of water. The first four of the series are gaseous at ordinary temperatures, the next sixteen are liquids, and the remainder solids. A gradual increase is observed in their boiling points and specific gravity. They are employed practically for a great many purposes.

Diatomic Hydrocarbons or Olefines.—These have been obtained by the removal of water from alcohols of the series $C_nH_{2n+2}O$; thus—

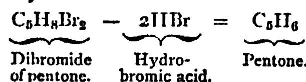


and by many other reactions. Some of them appear to occur in petroleum. Unlike the paraffines, they can combine directly with certain elements, especially with chlorine or bromine, forming products of addition; thus—

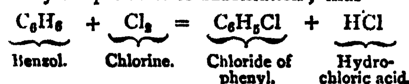


The olefines do not possess any practical importance further than that one or two of them (Ethylene and Propylene) occur in coal-gas, and contribute in considerable measure to its illuminating properties.

Acetylene Series.—These H. have been chiefly obtained by the removal of hydrochloric or hydrobromic acid from the product of addition of chlorine or bromine with the olefines, by treating them with caustic potash dissolved in alcohol; thus—

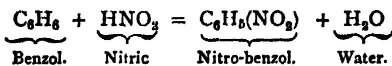


They can combine with two or four atoms of chlorine and bromine; thus—



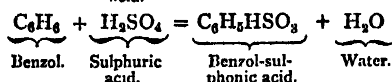
Acetylene occurs in small quantity in coal-gas, and is produced when various H. burn in a limited supply of air. The other members of the series are unimportant.

CnH2n - 4 Series is unimportant, and but few of its members have been obtained. They are prepared by removal of hydrobromic acid (by alcoholic potash) from substances similar to dibromide of acetylene—



Benzol Series.—This is perhaps the most important series of all the H., not only from the chemist's point of view, but to the world at large, as the compounds of benzol and its homologues are in many cases of the greatest practical importance. Most of the artificial colouring matters—the aniline and alizarine dyes—carbolic acid, and other valuable products, are derived from them.

Benzol and other H. of the series are produced when coal is distilled at a comparatively high temperature, as in the manufacture of coal-gas. They are separated from the tar which is produced by the process of fractional distillation. (See DISTILLATION.) It is remarkable that at a lower temperature than is employed in the distillation of coals for gas, little or none of the benzol series is produced, but principally the paraffines. Thus two distinct sets of products may be obtained at will from coal, each set possessing considerable practical importance. Benzol does not readily yield products of addition when treated with chlorine or bromine, nevertheless a compound $C_6H_6Cl_6$ has been obtained. The action of the haloid is usually to replace the hydrogen and yield products of substitution; thus—



By continuing the chlorination, a body having the formula

C_6Cl_6 may be obtained. The H. of this series are remarkable for the readiness with which they yield nitro- and sulpho-derivatives when treated with nitric or sulphuric acids; thus—

$$\underbrace{C_6H_6}_{\text{Benzol.}} + \underbrace{HNO_3}_{\text{Nitric acid.}} = \underbrace{C_6H_5(NO_2)}_{\text{Nitro-benzol.}} + \underbrace{H_2O}_{\text{Water.}}$$

$$\underbrace{C_6H_6}_{\text{Benzol.}} + \underbrace{H_2SO_4}_{\text{Sulphuric acid.}} = \underbrace{C_6H_5HSO_3}_{\text{Benzol-sulphonic acid.}} + \underbrace{H_2O}_{\text{Water.}}$$

The study of the benzol derivatives has added largely to the number of organic substances, and has opened up new fields of research and speculation. The properties of these substances are indeed of such a special character that they are usually considered as a separate group, to which the name of *aromatic bodies* has been given.

Hy'drocele (Gr. *hydōr*, 'water,' and *kēlē*, 'a swelling') is the medical term for dropsy of the tunica vaginalis, the serous membrane, or investing sac of the Testis (q. v.). H. may occur as the result of acute orchitis, but more commonly as a chronic disease. It begins with a swelling and sense of weight about the testis, the tumour becoming oval or pyriform in shape, smooth, and uniformly tense and hard, and often having a semi-elastic feeling. The most characteristic sign of H. is its translucency by transmitted light. The *palliative* treatment of H. consists in wearing a suspensory bandage, or in tapping with a fine trochar. The *curative* treatment has for its object the excitation of a sufficient degree of inflammation in the tunica vaginalis to restore the balance between secretion and absorption, and this is most effectually done by tapping, followed by the injection of the tincture of iodine through the canula into the tunica vaginalis.

Hydroceph'alus (Gr. *hydōr*, 'water,' and *kephalē*, 'the head'), or **Water in the Head**, is a disease of the brain resulting in an effusion of serous fluid between the membranes of the brain or within its ventricles. H. may be congenital, depending upon defective development or disease during fœtal life; or it may occur at some period in after-life, but most frequently during infancy, in an acute or chronic form. Effusion of serum into the ventricles or into the cavity of the arachnoid is generally accompanied by some lesion of the brain or of its membranes, so that H. is usually acute and inflammatory at its commencement. The fluid effused is sometimes very great, filling the whole cavity of the arachnoid as well as the ventricles, and the greater part is generally contained in the lateral ventricles, and in lesser quantity in the third and fourth ventricles, the effusion being frequently associated with tubercules in the brain or membranes. The form of the head (which is often enormously large) is sometimes very irregular, one side being much larger than the other, and the bones of the skull are very thin and transparent, the sutures being commonly separated from each other, at their superior portions, by a wide extent of membrane. The membranes are generally thickened, and the brain is sometimes so compressed, that but little of the organ remains. Acute H. is divided into three stages: (1) the stage of irritability; (2) that of diminished sensibility; and (3) that of convulsions or palsy. The *first stage* is generally preceded by giddiness and general constitutional disorder. Then the senses of sight and hearing become morbidly acute; the pupils are contracted or dilated, and the eyebrows are knit; there is great fretfulness of temper; the sleep is short and disturbed, and the patient wakens up with a scream, and complains of headache, the more prominent symptoms being those of *meningitis*. In the *second stage*, the child lies in a state of stupor, the eyes being half-closed, dull and heavy, sometimes staring or squinting, and the pupils are contracted or expanded. The patient utters shrill piercing screams, and the hands are tremulous, and engaged in picking the nose or mouth. In the *third stage*, the patient either sinks or recovers, and when the former is the case, the pulse becomes more frequent, the eye red and dim, and delirium, partial or general convulsions, or paralysis of one limb or one side, follow. The duration of the acute form of H. is about three weeks, each stage averaging about a week. In chronic H., when the disease is fully formed, whether it be congenital or not, the child is generally of feeble intellect, irascible, of extreme muscular debility, often epileptic, and either paralytic or scarcely able to walk. The remote causes of H. are often obscure, but they are principally referred to injuries of the head, inflammation of the ear, dentition, worms, the retrocession of cutaneous eruptions, the action of morbid poisons, as that of scarlet fever, pertussis, and measles; and of constitutional diseases, as tuberculosis and syphilis. The period of greatest liability to H. occurs between the second and fifth years. There is also a morbid state resembling H., called spurious H., or hydrocephaloid disease. Spurious H. occurs among children from a few months to two or three years of age, of a delicate constitution, or who have suffered from debilitating diseases, and is indicated by heaviness of the head, a remarkable expression of langour and drowsiness, the eyes being unattracted by any object put before them, and the pupils insensible to light. The disease is one of debility or atrophy. In *acute* and *chronic* H., where there is plethora, or inflammation, or an approach to inflammation, the surface of the fontanelle is convex and prominent; but in *spurious* H., where there is emptiness and want of support, the fontanelle is concave and depressed.

The chances of recovery are favourable during the first stage, if the treatment be judicious; but not so during the second stage. Blood-letting and active purgation have been said to yield the most satisfactory results; but the disease has been more successfully treated on the principles of hydrotherapia. Such cases, however, should be left to the care of a skilled physician only. The disease was first described by Dr. Whyte, *Observations on Dropsy in the Brain* (Edinb. 1768). See also *Diseases of Infancy and Childhood* by Dr. West (Lond. 1865).

Hydrocharid'eæ, an order of Monocotyledons, which takes its name from *Hydrocharis Morsus-ranæ*, the frog-bit, a rather pretty white-flowered floating aquatic, not uncommon in ponds and ditches in England, but not reaching N. into Scotland. Other genera of this order are anacharis, stratiotes and vallisneria.

Hydrochlo'rate of Ammo'nia, or **Sal Ammo'niac**, is employed in medicine as an expectorant in chronic bronchitis, and is useful in rheumatism, portal dropsy, hepatites, scrofulous, and syphilitic enlargements of the glands, and in facial neuralgia. A saturated solution applied to corns and warts removes them, and acts as a stimulant and resolvant in enlarged bursæ. Ten grains in a glassful of cold water, frequently repeated, allays fits of coughing.

Hydrochlo'ric Acid (HCl) is a compound of hydrogen and chlorine, which is gaseous under ordinary conditions. Its aqueous solution has long been known in the arts under the names of *muriatic acid* and *spirit of salt*. Chlorine and hydrogen, when mixed in equal volumes, unite with a violent explosion in direct sunlight to form two volumes of H. A. In diffuse daylight they combine gradually; and in darkness no combination takes place. Chlorine has so strong an affinity for hydrogen that it often abstracts that element from its compounds. Thus turpentine ($C_{10}H_{16}$) ignites in chlorine and burns with a sooty flame, depositing carbon and evolving H. A. Commercially H. A. is very cheap; and this is due to its being produced in immense quantities as a by-product in the manufacture of the carbonate of soda. (See SODA.) It is the direct result of the action of sulphuric acid upon common salt, the other product of the reaction being sulphate of soda, the preparation of which is a necessary preliminary in the manufacture of the carbonate.

Pure H. A. is a colourless gas. It may be liquefied under extreme pressure, but it has never yet been obtained in the solid condition. It has a strong affinity for water, one volume of which at 0° C. can absorb 400 volumes of the acid. When, as a gas, it is brought into contact with moist air, it absorbs the moisture and produces an evident cloud. A strong solution of H. A., if heated, evolves the gas until the solution contains 20·2 per cent. of the acid, when it distils over like a single liquid compound at a temperature of 110° C. On the other hand, a weak solution when heated loses water till the same strength is reached, and then distils over unchanged. The existence of this particular solution, which is known as 'H. A. of constant boiling-point,' suggests that it is a real chemical compound; but that it is not so is proved by the fact that the strength of H. A. of constant boiling-point varies with the pressure under which the solution is formed. H. A. is readily acted upon by certain metals, evolving hydrogen, and leaving behind the chloride of the metal. Zinc gives such a reaction. Again, when treated

with certain metallic peroxides, H. A. produces the metallic chloride, water, and free chlorine. Thus Chlorine (q. v.) is ordinarily prepared by acting upon peroxide of manganese (MnO_2) with H. A.

Hydrochloric Acid is given medicinally in a very dilute form as a refrigerant, antiseptic, and tonic, and is applied, diluted with an equal quantity of water, to diphtheric patches in the throat. In cases of poisoning by H. A., the antidotes are chalk, magnesia, and emollient drinks.

Hydrocot'yle, a genus of *Umbellifera*, of which the best-known species is *H. vulgaris*, a very common British plant in marshes and boggy ground, and is popularly known as marsh pennywort, from its round leaves, or white rot, from its supposed injury to sheep. The genus numbers about seventy species, distributed through the temperate and tropical regions of the world.

Hydrocyan'ic or **Prussic Acid** (HCN) is a compound of carbon, hydrogen, and nitrogen, discovered by Scheele in 1782. It may be prepared pure by passing sulphuretted hydrogen (H_2S) over dry cyanide of mercury ($Hg(CN)_2$), maintained at a temperature of from 30° to 40° C. Sulphide of mercury (HgS) is left behind, and H. A. passes off in a state of vapour, and is condensed to a liquid in a U-shaped tube surrounded by a freezing mixture. Acetylene (C_2H_2) and nitrogen when mixed and fired by an electric spark also produce H. A. The pure substance is a colourless liquid at ordinary temperatures; it boils at 26°·5 C., and solidifies to a crystalline solid at 15° C. Its vapour burns with a violet flame. H. A. mixes with water in all proportions, but seems to form with it a compound having a definite chemical constitution represented by the formula $2HCN,3H_2O$. Whether pure or in solution, it tends of itself to decompose, especially under the action of light, depositing a brown substance. This action may be hindered by addition of a minute quantity of a mineral acid. The dilute aqueous solution employed in medicine is prepared by distilling a mixture of water, ferrocyanide of potassium, and sulphuric acid, when sulphate of potassium, ferrocyanide of potassium and iron, and H. A. result. Solution of H. A. is feebly acid, but acts upon oxide of mercury (HgO) to produce cyanide of mercury and water. By chemists, H. A. is regarded as a true hydracid (see HYDRACIDS), containing hydrogen united to a group of elements (CN) called Cyanogen (q. v.). The metallic cyanides resemble in constitution the haloid salts (chlorides, bromides, &c.), exactly as H. A. resembles the acids. Under its more popular name of prussic acid it is well known as a deadly and violent poison. Great caution is therefore necessary in experimenting with it even when it is in solution, since the inhalation of its vapour in very small quantity is sufficient to cause giddiness and headache. No real antidotes are known, but the usual remedies are ammonia and chlorine, which appear to act by exciting the nervous system.

Hydrocyanic Acid is employed medicinally as a sedative and antispasmodic in cases of vomiting, gastrodynia, and in dyspeptic palpitation. It is used externally as a lotion or ointment to allay itching of the skin; and, as a vapour, it is sometimes applied to the eye, or inhaled. In cases of poisoning, the antidotes are exposure to air currents, artificial respiration, and cold affusions. Freshly precipitated oxide of iron, with an alkaline carbonate, should also be given.

Hydrodynam'ics is the branch of dynamical science which treats of the motions and equilibrium of a material system, part or all of which is fluid. It may be thus said to investigate, on the one hand, the conditions of equilibrium of a fluid mass, and of a rigid system immersed in fluid; and, on the other hand, the motions of fluids in fluids or in confined channels, and the motions of solids through fluids. The subject naturally then divides into two parts, according as the system under consideration is or is not in equilibrium.

1. *Hydrostatics.*—In establishing the fundamental principles of hydrostatics, it is necessary to define what is strictly meant by a *fluid*. A *perfect* fluid is an unrealisable conception, and is defined as a body incapable of resisting a change of shape. It can therefore experience no tangential stress; and accordingly the pressure which the fluid exerts on any surface, whether of a solid or of a contiguous portion of the fluid, is at every point perpendicular to the surface. It is almost self-evident that, if a material system be in equilibrium, we may suppose any portion of that system to become rigid and fixed without destroying the equilibrium. Keeping this consideration in view, imagine the fluid to be contained in a closed vessel, and to be wholly uninfluenced by external force, such as gravity. The resultant pressure of the fluid upon any portion of a spherical surface must pass through the centre of the sphere, because each component pressure does so. Suppose, then, a portion of the fluid in the form of a plano-convex lens to be solidified. Since the resultant pressure on the convex side must equal the resultant in the plane side, the latter must pass through the centre of the sphere of which the convex surface is a part, and must therefore, being perpendicular to the plane, pass through the centre of the circular area. The resultant pressure accordingly on any circular area of a plane surface passes through the centre, and therefore the pressure is the same at all points of a plane. Hence the resultant pressure on any plane surface passes through its centre of inertia. Now, consider the pressures upon the bounding planes of a triangular prism. The three resultant pressures evidently act in a plane cutting the prism at right angles. If we draw the triangle of section, we may represent the pressures by lines perpendicular to the sides of the triangle at their middle points. They must accordingly meet in a point, and being in equilibrium, must be proportional to the lengths of their respective sides, *i.e.*, to the breadth, and therefore area, of the faces of the prism. Hence the resultant pressures on the faces are proportional to the areas of the faces, and therefore the pressure is the same in any two planes that meet. Summing up our results, it appears that the pressure is the same at every point of the fluid, when the pressure is dependent only on the pressure exerted by the enclosing vessel. If external forces act upon the fluid, the pressure will be the same in all directions at any one point, but will vary continuously from point to point. Thus, when gravity is the force to be considered, and the fluid incompressible of density ρ, the increase of pressure per unit of length as we descend is, in kinetic units $g\rho$, where g represents the force of gravity. The pressure is obviously the same along any horizontal plane; in other words, the surfaces of *equal pressure* are horizontal planes. If equilibrium exists under the action of any forces which constitute a conservative system (see ENERGY), the surfaces of equal pressure are coincident with the surfaces of equal density, and are everywhere perpendicular to the lines of resultant force; and indeed equilibrium cannot exist except this latter condition be fulfilled.

If a solid be immersed in a fluid, it will sink or float according as it is specifically heavier or lighter than the fluid. According to the principle of Archimedes, any body which is kept immersed loses in weight, and this loss is exactly equal to the weight of the fluid displaced, in other words, to the weight of the quantity of fluid equal in volume to the immersed body. Accordingly, a body will weigh less in a heavier fluid than in a lighter, a principle which affords an easy method of comparing the specific gravities of different fluids. If the immersed body be lighter specifically than the surrounding, it will have, so to speak, a *negative* weight, and will tend to rise. If the fluid be incompressible, the body will rise to the free surface and float there; and if the fluid be elastic, the body will rise till it becomes, bulk for bulk, of the same weight as the surrounding fluid. That point in a body at which the resultant hydrostatic pressure may be supposed to act is called the centre of pressure; and the discussion of its position is most important when we come to treat of the equilibrium of solids and fluids. Suppose a body to be floating at the surface of a liquid; it is buoyed up by the upward pressure of the liquid, which is equal and opposite to the downward weight of the body: the body is then in equilibrium under the action of two forces—the weight of the body acting downwards at its centre of gravity, and the pressure of the liquid acting upwards through the centre of pressure. For a position of equilibrium, then, these two centres must lie in the same vertical line. If they happen to coincide, the body may float in any position whatsoever. If they do not coincide, the only position of stable equilibrium is that position which brings the centre of gravity vertically *below* the centre of pressure. To make this clear, suppose the centre of gravity to be the higher; there will be, of course, equilibrium when the two are in the same vertical line, but the equilibrium will be essentially unstable. For consider the effect of a minute rotation of the body round a horizontal axis, perpendicular to the line joining the centres (this instantaneous centre of rotation is called the *metacentre*), and the motion, however slight, will call into action

a couple, which will tend to turn the body *away* from its former position, which is, therefore, one of unstable equilibrium. If the centre of gravity be below the centre of pressure, a similar minute displacement will, it is true, call into action a couple; but this couple will tend to bring the body *back* to its old position, which is, therefore, one of stable equilibrium. Accordingly, it is of importance in the building of ships to put the centre of gravity as low as possible. See EQUILIBRIUM.

Under the statics of fluids must also be included the theorems relating to surfaces of equilibrium in rotating masses of fluid. For instance, if a mass of liquid contained in a rigid cylindrical box be set in rotation round its axis of figure, the surfaces of equal pressure under the action of gravity are no longer planes, but paraboloids of revolutions with their vertices pointing downwards; so that at the free surface, if there be one, the liquid will appear concave. The most important problem in this connection, and one whose general solution has not yet been attempted, is to find all the forms of equilibrium which a mass of homogeneous incompressible fluid, held together by the mutual gravitation of its parts, and rotating with uniform angular velocity, may assume. Newton and Maclaurin discovered that an oblate ellipsoid of revolution was such a form—the angular velocity for a given eccentricity being proportional to the square root of the density. Another form, as first discovered by Jacobi in 1834, is an ellipsoid with three unequal axes, of which the least is the axis of rotation. These problems derive their great interest from their evidently close connection with the figure of the earth, and they have engaged the attention of the most profound mathematicians of the last two centuries.

2. *Hydrokinetics.*—As long as we confined ourselves to problems of equilibrium, there was no danger in regarding all fluids as satisfying the definition of a perfect fluid. But in problems of fluid-motion it is otherwise. All fluids are *viscous*, and therefore resist more or less a change of shape. This viscosity is very different for different liquids, a fact which may be at once seen by comparing the properties of such liquids as tar or treacle with those of water or ether. The latter are what are known as mobile liquids, and in their motions they most nearly approach the ideal incompressible fluid. If a jet of water be projected into the air, each particle will travel as any other projectile would. If we neglect the resistance of the air, or project the jet *in vacuo*, the path which each particle describes will be a parabola, and therefore the continuous stream of water will assume a parabolic form. The dimensions of this parabola will depend upon the velocity of projection and the angle of elevation. (See PROJECTILES.) If the jet be projected horizontally, the vertex of the parabola will be at the origin of the jet; and if it be projected vertically, the parabola will become in theory a straight line. Practically, however, the mutual collisions of the particles and the physical impossibility for one material current to travel opposite to and in the same course as another, necessitate the spreading out of the water on all sides as it reaches its highest limit. The best method of producing a steady stream of water is to provide a vessel with an orifice near its base, through which the water is pushed by the pressure of the column in the vessel. If the orifice be small, we may consider the kinetic energy of the issuing stream to be equal to the loss of potential energy of the whole due to the depression of the free surface. Hence the velocity with which an incompressible fluid escapes from a small orifice is the same as would be acquired by falling from the free surface to the level of the orifice. If the stream be then projected vertically upwards, it will rise almost to the height of the free surface, and this is the principle upon which all our artificial fountains are constructed. If the orifice be simply a hole in the side of the vessel, it is evident that the issuing stream is made up of innumerable streams in the liquid inside the vessel converging towards the orifice. This produces as a first effect the continuous contraction of the stream for some little distance beyond the orifice—a contraction which is more rapid the nearer the section is to the orifice. The direct dynamical effect of this contraction is the increased velocity of the issuing jet; and thus is explained the greater velocity, which experiment shows the jet to have, than is indicated by the theory given above. It is a question of great practical moment as to how the efflux of water will be affected if the issuing stream, instead of being projected into the air, is carried along a pipe of given form and dimensions. If a stream of fluid travel along a tube, completely filling it at every section, at the surface of contact friction comes strongly into play, so that the fluid in the centre necessarily moves fastest. Consequently in every fluid which is moving in a prescribed path there is a kind of *shearing* motion (see STRAIN), so that particles originally in a straight line are no longer so, but lie on a hyperbolic-shaped curve which points with its vertex in the direction of motion of the fluid. Rivers, currents, winds, all show this peculiarity, but in none can it be so well remarked as in Glaciers (q. v.).

Passing to the consideration of the motion of solids in fluids, it is evident first of all that a solid moving in a perfect fluid would experience no resistance. The resistance which experiment shows us to exist in all such cases is due then to the imperfection of our fluids—in other words, to their *viscosity*. Resistance in itself has no existence. It is merely a convenient term for a transformation of some of the kinetic energy of the moving solid into a less evident form. The solid in moving through the fluid must do work in altering the relative positions of the fluid particles, since the fluid is not perfect; and this alteration may so take place as to result in the formation of currents, eddies, and waves, the energy of whose motions, together with the amount of heat evolved, will of course be the equivalent of the kinetic energy lost by the solid. This introduces us at once to the more abstruse questions of waves and eddies. The former are treated more fully under their special heading, and the latter under VORTEX. At the meeting of the British Association in 1876, Professor Osborne Reynolds gave most valuable information regarding the relation of vortex-motion to solids moving through liquids. Helmholtz showed that vortex-motion could neither be created nor destroyed in a perfect fluid—so that if it once existed, it must exist for ever, and if it did not exist at any instant, it never could exist. Inasmuch as our fluids are imperfect, vortex-motion can be easily produced, and indeed is always a result of a displacement such as that occasioned by the motion of a solid through a liquid. One of Reynolds's many beautiful results is that a body shaped like a watchglass, convex on the one side and concave on the other, will, if wholly immerged in water, move with less resistance when its concave side is directed forward than when its convex side is. This result is at first so antagonistic to all preconceived ideas of the relation existing between the form of a body and the resistance offered to it, that it merits a closer attention. When a vortex-ring is directed fairly against a disc-shaped solid, which is immerged in the fluid, and whose plane is perpendicular to the direction of motion of the vortex ring, it will carry the disc along with it. But the disc by its own motion may be made to generate a vortex ring which will follow in the wake of the disc. Now in the case of the watchglass-shaped body, a more perfect vortex ring is generated by the body when its concavity is first, and this ring travels exactly at the same rate as the body. When the convexity is first, the vortex ring is not so perfectly formed as above, and lags behind, so that the body is forced to throw off another vortex ring, which behaves precisely as the former, and necessitates the formation of a third. The kinetic energy of the body is thus gradually used up in generating a succession of vortex rings; and accordingly the body comes to rest sooner than in the other case, where one vortex ring was formed once for all. The true nature of the phenomena which occur in the motion of a solid through a fluid is still very imperfectly understood, but there can be little doubt that the theory of vortex motion as elaborated by Professors Helmholtz and Sir W. Thomson must henceforth have a most important bearing upon the further elucidation of the science. Many facts and experiments have necessarily been omitted in such an article as the present, but these may be obtained from any good ordinary text-book on physics. The principles of hydrostatics are established in a lucid and elementary manner in Thomson and Tait's *Natural Philosophy*, where also are given the usual mathematical formulæ which apply to a fluid system in equilibrium.

Hy'dro-Fluo'ric Acid. See FLUORINE.

Hy'drogen, one of the chemical constituents of water, was first recognised as an element by Cavendish in 1766. By acting upon metals with dilute acids he obtained a gas which was capable of burning in air, and which he accordingly named 'inflammable air' or gas. Later, when its properties had been more thoroughly investigated, it was discovered that its combustion resulted in the production of water—hence its present name *H.* (Gr. 'water-producing'). The gas is also obtained native,

but in small quantity, as an emanation from the earth in Tuscany and Iceland. It exists, however, in vast quantities in the chromosphere of the sun and other stars—being the principal constituent of the coloured flames or prominences which have of late years been so fully studied. (See SUN.) In combination with other metals it occurs constantly on our globe, not only in water, but as an important element in all organic compounds. It may be obtained by analysis from water in three distinct ways —by *electrolytic action*, when H. is given off at the negative pole (see ELECTROLYSIS); by *dissociation* of the vapour of water into its components by passing it through a red hot iron tube, when the iron absorbs the oxygen and lets the H. go free; and by the *chemical action* of certain metals, such as sodium and potassium, which have a strong affinity for oxygen. Practically, H. is prepared by the action of a dilute solution of a strong acid (such as sulphuric or hydrochloric) upon a metal, usually iron or zinc—the metal and the H. changing places. Thus, sulphuric acid acting on zinc produces sulphate of zinc and free H.

H. is a colourless inodorous gas, which has never yet been obtained in the liquid state. It is the lightest known substance, 11·16 litres weighing only 1 gramme at ordinary temperature and pressure; while the same volume of air weighs 14·49 grammes. By chemists, accordingly, the H. atom has been taken as the unit with which to compare the atomic weights of the other elements. If two volumes of H. be mixed with one volume of oxygen, no combination takes place; but by the application of a flame or the passage of an electric spark, a sharp explosion ensues, and water is formed. This formation of water by synthesis may be represented by the equation

$$2H_2 + O_2 = 2H_2O$$

which indicates that for every three volumes of the mixture two volumes of steam at the temperature of combustion are formed. If a jet of H. be burned in oxygen, a very intense heat results, which has been utilised as a source of light in the oxyhydrogen or Drummond Light (q. v.), and as an agent for fusing and melting platinum. Further, the strong affinity of H. for oxygen renders it a powerful reducing agent, a property which is made use of in the reduction of metallic oxides. Under the influence of sunlight, H. combines directly with chlorine to form Hydrochloric Acid (q. v.). In combination with carbon, or with carbon and oxygen, it forms innumerable compounds and groups of compounds (see ALCOHOL, FATS, HYDROCARBONS, OILS, &c.), which are of great practical importance. In many of its actions H. strongly resembles a metal; and indeed its compounds, which are commonly called acids, may be regarded as *salts* in which H. plays the part of the metal. Thus, sulphuric acid (H_2SO_4) may be regarded as sulphate of H., corresponding to the sulphates of potassium, sodium, &c. H. forms with oxygen another compound, *Peroxide of H.*, which has the formula H_2O_2. It is prepared by passing a stream of carbonic anhydride through peroxide of barium (BaO_2) suspended in water, when carbonate of barium and peroxide of H. result. It is a peculiarly unstable compound, liquid at ordinary temperature, and decomposing into water and oxygen. The presence of gold, silver, or platinum hastens this decomposition without the metal itself experiencing any change; while, if the oxide of one of these metals is employed, the decomposition of the peroxide of H. is accompanied by the decomposition of the metallic oxide.

Hydrog'raphy (Gr. *hydōr*, 'water,' and *graphē*, 'description') is that branch of physical geography which describes the oceans, seas, and rivers, with their physical phenomena. It takes particular account of the configuration of the land and sea, of soundings, currents, islands, shoals, &c.; includes the construction of charts and maps; and is consequently of inestimable service to the navigator. In all important maritime nations, hydrographers are Government officials. In Britain the chief hydrographer is usually a retired captain in the navy.

Hy'dromancy (Gr. *hydōr*, 'water' and *manteia*, 'divination'), a kind of divination by means of radiations from water or from bright objects thrown into it. It was practised by the Romans, and, according to Varro, originated among the Persians.

Hydroma'nia. See PELLAGRA and SUICIDE.

Hydrom'eter, the name now universally given to instruments for measuring the specific gravities of liquids, the principles of the construction of which are described under AREOMETER.

Hy'dromys, a genus of Rodents, represented by the *H. chrysogaster* or beaver rat of Van Diemen's Land. This animal swims and dives with great facility. Its colour is a rich brown, tinted with golden lines on the under parts, sides, and shoulders. The tip of the tail is white. The body is long, and the total length of the animal is about 2 feet. The hind feet are webbed. The teeth include two incisors, two premolars, and two molars in each jaw.

Hydrop'athy, or **Hydrother'apy** (Gr. *hydōr*, 'water,' and *therapeia*, 'care,' or 'cure;' hence popularly termed the 'water-cure'), a system of practical medicine in which the applications of water, in combination with general hygienic measures, are chiefly relied upon in the treatment of disease. Water has been prescribed, externally and internally, by physicians from the remotest times as a therapeutic agent in the treatment of acute and chronic diseases, but it was not till the beginning of the present century that the various modes of application were reduced to a system by Vincent Priessnitz, a Silesian farmer, the father of the present system of H. Priessnitz was not an educated physician, and could not understand the philosophy of his own practice; so that both he and his immediate followers ran into numerous extravagancies by endeavouring to construct a new system of universal medicine, based upon an imperfect and incomplete system of physiology and pathology, instead of professing to institute only a system of hygienic medicine. In consequence of the absurd pretensions and mistaken zeal of the early advocates of H., the progress of the practice was much retarded; but hydrotherapy is now admitted to its proper place in therapeutics as a valuable aid to nature's strivings after health—the *vis medicatrix naturæ*.

A certain quantity of water or fluid aliment is necessary for digestion, and for the metamorphosis of tissues, whether it be physiological or pathological, and water, in larger quantity, promotes the functional activity of the kidneys, and the cutaneous transpiration, increasing the excretion of urea, chloride of sodium and phosphoric acid. The intense craving for cold water, in certain forms of disease, is an expression of nature regarding rapid tissue-changes taking place in the system, the extraction of the fluid constituents of the blood or tissues, or an abnormal increase in their solid constituents; and the barbarous system of forbidding water, in such cases, not only retarded the cure, but imperilled the patient's life. Water should be administered freely, but not in very large quantities at a time, in every case of illness in which great thirst is experienced.

The physiological effects of the external application of cold and hot water have been described in the article Bath (q. v.), but there are certain forms of baths frequently had recourse to in hydrotherapia which may be briefly described. Instead of the warm or hot bath, the vapour of water in the form of the Turkish Bath (q. v.), or the steam bath is frequently used, and similar objects may be attained by means of the warm or hot wet-packing. The *Turkish bath* consists in the exposure of the body in suitable apartments to the vapour of hot water at a temperature gradually increased from 96° to 140° Fahr. The bath should not exceed fifteen minutes in duration, and should be followed by the cold or shower bath conjoined with friction. When special arrangements are not available, the same end may be attained by causing the patient to sit on a low stool with a blanket pinned about his neck, and under this the vapour of water may be conducted, or generated by means of a spirit lamp. The *warm* or *hot wet-packing* is applied by enveloping the body, or some part of it, in cloths wrung out of hot water, and then covering with blankets, a mode of applying moist heat which may be advantageously used. The *cold wet-pack* consists in wrapping the body in a linen sheet wrung out in cold water, blankets being afterwards wrapped round the body of the patient. When reaction is fully established, the wet-pack should be removed, and the body well rubbed with dry towels. When active diaphoresis is desired, the patient must be well enveloped in blankets, and remain within them for an hour or more. The *wet-pack* may be applied with water at any degree of temperature. The *rubbing wet-pack* consists in enveloping the body with a sheet dipped in cold water, and rubbing vigorously with the sheet to induce reaction quickly, the skin being afterwards dried by means of coarse towels. The *douche* consists in the impact against the body of a column of water from a height which should not be greater than 10 feet, the column not being larger than 4 inches. It may be applied

by means of a pitcher or water-bucket, or by a hose attached to a water-pipe, and, in the latter case, it may be applied in any direction, and the effect may be regulated by the size of the stream and the force with which it is thrown against the part. There are various local baths, such as the sitz-bath, the uses of which are indicated by their names.

The applications of water in the treatment of disease are numerous and important, but it should be always remembered that the advocates of H. profess to do nothing more than aid the *vis medicatrix naturæ*. To do so effectually, however, implies a complete knowledge of physiology and pathology, as well as a discriminating knowledge of the symptoms of disease, otherwise the reparative processes of nature may be ignorantly retarded, and with fatal results. Modes of treatment which might be of great benefit to one person might be fatal to another through carelessness or an error in diagnosis.

The following are some of the diseases which have been treated successfully on hydropathic principles. *Tonsillitis*, *diphtheria*, and *spasmodic croup*, may be greatly benefited by the topical application of ice to the fauces, by the wet-pack to the neck, or by cold affusions. Habitual constipation may be overcome, sometimes, by the use of cold water before breakfast, and bleeding hæmorrhoids by a daily rectal injection of cold water. Pure water is an effective diuretic in *acute desquamative nephritis*, and the internal use of water may be supplemented by hot water fomentations to the lumbar region. The Turkish bath is of great service in cases of *chronic muscular rheumatism*, and stiffness, the result of *acute rheumatism*. *Lead*, *mercurial*, and *paludal cachexia*, are relieved by the Turkish bath and the wet-pack, and, in such cases, free diaphoresis should be encouraged. The treatment of *fevers* by means of cold baths has been recently revived and extensively practised. The fever patient is put into a bath about the normal temperature of the body (98° Fahr.), and the water is cooled by the addition of ice to 80° Fahr. or even to 40° Fahr., according to the effect produced on the temperature of the body, which, for this purpose, should be taken in the rectum. When a positive reduction of the fever heat has occurred, the patient should be wiped dry, placed in bed, and covered with blankets. The bath may be used from two to six times each day, and for from five minutes to half-an-hour. The appliances for administering baths to fever patients are—a strong sheet for lifting the patient into the bath tub, a bath and clinical thermometer for noting the variations of the temperature of the water and body. In such cases the wet-packing, although not so efficacious as the bath, may be used as a powerful means of reducing fever heat. Some practitioners administer the baths regularly in cases of enteric fever, at six A.M., one to three P.M., and seven P.M. By this mode of treatment the mortality is said to be less, and the complications fewer, excepting hæmorrhage, than by other modes of treatment. H. thus applied is of great advantage in the *hyperpyrexia* of *acute rheumatism*, *delirium tremens*, *fevers*, &c., and also in *typho-malarial fever*. Scarlatina, measles, smallpox, cerebro-spinal meningitis, are advantageously treated in the same way, or by means of the cold or hot wet-pack. The wet-packing is efficacious in *acute rheumatism*, and the Turkish bath in chronic rheumatism and gout. In *acute cerebral congestion* the cold douche may be applied to the head, or a piece of ice to the nape of the neck, while the feet are immersed in warm water. The same line of treatment is of value in *inflammatory affections* of the meninges, *meningeal hæmorrhage*, *sunstroke* or *thermic fever*, where the range of temperature is very high, and also in *delirium tremens*, when there is no great depression of the bodily powers; but in cases where there are symptoms of atheroma of the cerebral arteries, or of cardiac disease, the treatment is of doubtful utility, and in some cases may cause mischief. Bucknill and Tuke recommend the shower bath in cases of *intercurrent mania* and *monomania*, and in *melancholia*, and the warm bath at 95° Fahr. to subdue the excitement and sleeplessness of various forms of insanity. *Lesions of the spinal meninges* and of the *cord* are remediable by similar means. In *inflammatory affections of the chest* the hot wet-pack diminishes the pain and relieves the inflammation, and hot or cold applications may be used by means of spongio-piline. Ice bags to the chest and back is of great utility in pulmonary hæmorrhage, in *inflammatory affections of the abdominal organs*, *strangulated hernia*, *hæmorrhoids*, *bubo*, and *swelled testicle*; and cold water, by means of injections, are of great utility in *uterine* hæmorrhage, and hot water, in cases of *chronic metritis*. See *Principles and Practice of the Water Cure*, by Dr. James Wilson; the works of Dr. Edward Johnson; and also Dr. Lane's treatise, *H. or Hygienic Medicine*; and for more recent information see *Beobachtungen und Versuche über die Andwendung des kalten Wassers bei fieberhaften Krankhaften*, by Professor Liebermeister (Leips. 1868); Ziemssen's *Cyclopædia*, vol. i.; *Handbuch der allgemeinen und speciellen Balneotherapie*, by Dr. Valentiner, 1873; *Observations on the Treatment of Hyperpyrexia*, by Dr. Wilson Fox; *Lancet*, vol. ii. 1871, p. 231 *et seq*.

Hydropho'bia (Gr. *hydōr*, 'water,' and *phobos*, 'fear'), a disease produced in the human species by the inoculation of a specific poison derived from animals of the canine or feline race while suffering from *rabies*. The saliva or secretion issuing from the mouth of the diseased animal is the medium of inoculation, either through a wound or a thin epidermis without abrasion, and there is no case on record in which the disease has ever originated *de novo* in man. H., the most distressing disease to which man is subject, is fortunately of rare occurrence in this country, so much so, indeed, that its very existence has been doubted by some, who have ascribed death, in such cases, to the influence of morbid imagination. Rabies is extremely rare, even among dogs, and there can be no manner of doubt that it is communicable to man; but it does not follow that every person bitten by a dog suffering from rabies is seized with H. The specific virus may not be excreted, or it may be so in small quantity, or it may not be present on that portion of the teeth by which the bite is inflicted; so that a dog suffering from rabies may not communicate the disease to those bitten by it, or it may communicate it to one or more, according to the circumstances under which the wound is inflicted. Hitherto rabies in the dog and its analogue H. in man, has been much more common in France, Germany, Italy, and Holland than in Great Britain, but within recent years cases of H. have been on the increase in this country. In 1866 there were thirty-six deaths from H. in England, and none in Scotland; but in the twelve years 1855–66 there were twelve cases in Scotland, and within a few months, in 1876–77, four cases of H. terminated fatally in the city of Glasgow alone, the disease being marked by the well-known characteristic symptoms. H. appears generally in an epidemic form, but its distribution is always in a direct ratio with the prevalence of *rabies* among the canine species. From 1800 till 1860 no case of H. had occurred in Dresden; but in 1863 ten cases were known to have occurred throughout Saxony, coincident with the appearance of *rabies*. In 1864 there were 33 cases, in 1865, 227, in 1866, 287, and in 1867, 250. Preventive measures were then adopted, and the epidemic subsided. In 1867, owing to the public alarm which had been excited in this country, a 'Metropolitan Street Act' was passed, which enabled the police to seize all vagrant dogs, and in July 1871 an 'Act to provide further protection against dogs' was passed, the Act being applicable to Great Britain and Ireland. The wound inflicted by the bite generally heals readily, there being nothing in its appearance, during the healing process, to distinguish it from an ordinary dog-bite, nor do any constitutional effects immediately supervene, the poison lying dormant or latent in the system. It is probable that during the period of latency, which may vary from a few weeks to several months, the *materies morbi* is gradually undergoing some development, and increasing in quantity, and that the result of this growth and development is the morbid symptoms manifested in the nervous centres. If this hypothesis be correct, the great variation in the period of latency may be accounted for, as such changes may be produced more rapidly in one subject than in another. As a general rule, the constitutional symptoms do not appear earlier than the fortieth day after inoculation, and rarely after two years; but cases are on record of their occurrence on the day following the injury, and extreme cases, after an interval of five and even nine years. The period of incubation of the specific poison of H. is therefore indefinite.

The earliest symptom of H. is pain, or some unusual sensation, such as aching, tingling, burning, coldness, numbness or stiffness in the cicatrix, which generally swells, becomes of a red or livid colour, and sometimes opens up afresh, discharging a thick ichorous fluid instead of pus. This local change is accompanied with general nervous disturbance, the patient becoming dejected, morose, irritable, restless, and sleepless; there is usually great intolerance of bright and sudden light, currents of

cold air, the sudden appearance of strangers, and pains in various parts of the body are experienced. After the continuance of these symptoms for an indefinite period, stiffness or tightness is experienced in the throat, swallowing, especially of liquids, is accomplished with difficulty, and rigors supervene. As the disease advances, swallowing excites the most painful spasms in the back part of the throat, and the indescribably painful sensations which ensue cause the patient to dread the very sight or thought of liquids, although intense thirst may be experienced, and hence the designation of the disease, H., or 'water-fear.' These prominent symptoms are accompanied with nervous paroxysms, sensations of stricture or oppression about the throat and chest, painful and embarrassed breathing, a peculiar sighing and sobbing movement, a sense of impending suffocation, and most markedly, a horribly violent convulsion or spasm of the muscles of the larynx and pharynx, preventing swallowing, and retarding the entrance of air to the windpipe. Shuddering tremors, resembling general convulsions, agitate the body, and there is always, at intervals, a fearful expression of anxiety, terror, or despair, which once seen, can never be forgotten. There is seldom any disturbance of the intellectual faculties; but some or other of the special senses are frequently morbidly acute. Paroxysms are brought on by the slightest causes, such as the sound of water poured from one vessel to another, a current of cold air, or any cold substance applied to the body; the sight of liquids or the shining surface of a mirror; the suggestion of ideas connected with swallowing, or the recollection of sufferings experienced in former attempts. In H. there are frequently hallucinations of sight and of hearing, hyperæsthesia of the skin, exaltation of the senses, and satyriasis and nymphomania are occasionally present. A copious secretion of a viscid tenacious mucus in the fauces—'the hydrophobic slaver,'—is another characteristic symptom. The mouth is often full of mucus, which flows from its corners, or which the patient spits out upon everything around him, as if the dread of swallowing it induced an instant and eager expulsive effort. Although general incoherence is very unusual, there are frequently paroxysms of mental excitement approaching to insanity, but entirely distinct in their essential features from an attack of acute mania. Not unfrequently the patient is aware of the approach of these attacks, and, being fearful of the loss of self-control, begs to be restrained; but it is in comparatively rare instances that he gives way to wild fury, and the desire to bite is rare. Cases of general maniacal excitement do occur, characterised by outbursts of extreme violence and fury, followed by a state of listless gloom, dejection, and apathy. The disease generally terminates fatally between the second and fifth day, though it sometimes runs on to the seventh, eighth, or ninth day. Death most commonly takes place with well-marked symptoms of asphyxia, due to convulsions of the respiratory muscles, but, in some cases, it occurs as a consequence of complete exhaustion, or as a result of paralysis. Death has been the inevitable termination of H. in every well-authenticated case. Although H. is obviously connected with disorder of the nerve centres, no notable alteration in the minute structure of the brain and nerve tissues has, until very recently, been detected. In 1872 Dr. Clifford Allbut examined specimens taken from the central convolutions, the central ganglia, the medulla oblongata, and the spinal cord, and found the following morbid conditions, but in different degrees, present in all: (1) Great vascular congestion, with transudation into the surrounding tissues. In the grey centres the vessels were distended, their walls thickened, and here and there were seen patches of nuclear proliferation. There was diminished consistence, especially of the medulla. (2) Hæmorrhages, and in many places a refracting material outside the vessels, due apparently to exudations. (3) Little gaps caused by the disappearance of nerve strands, which had passed through granular disintegration. In 1877 Dr. Joseph Coats of Glasgow made microscopic examinations of the cicatrix, and of portions of the cord and medulla oblongata. In the former he found the skin and fat infiltrated with round cells, and transparent globular bodies, like drops of exuded fluid, on the internal walls of the vessels; and in the latter he found accumulations of round cells in the perivascular spaces of the medium-sized vessels, and similar cells around the ganglion cells, and in all parts of the system there were numerous amyloid bodies. These appearances are evidence of great irritation of the central nervous system, and also of parts near the cicatrix, the irritation being probably due to the specific virus introduced. Professor Maurice Benedikt describes somewhat similar appearances, certain of which he ascribes to the transformation of the red corpuscles of the blood. See *Rabies and H.*, by G. Fleming (Lond. 1872); *The Lancet* (Lond. February and March, 1877); *Virchow's Archiv.* (1876).

Hydrophylla'ceæ, an order of herbs, shrubs, and trees, chiefly natives of North America, of which about eighty species are described. None are of commercial or special economic importance, and only a few are cultivated for ornament. Of these, the best known are *Nemophila insignis*, introduced by Mr. Douglas from California, *N. maculata*, and two or three species of *Eutoca*. In India the beaten leaves of *Hydrolea Zeylanica* are used as a poultice.

Hydrostati'c Press, better known in its portable forms as *Bramah's Press*, is a machine which is capable of exerting enormous pressure. As its name implies, it depends for its action upon the properties of fluids. The hydrostatic principle which is involved is frequently termed the *hydrostatic paradox*, but it is simply the law already proved under hydrodynamics, that in a fluid at rest, under the action of gravity, the surfaces of equal pressure are horizontal planes. Consequently the shape of the containing vessel can have absolutely no effect upon the variation of pressure throughout the fluid mass. Imagine two cylindrical vessels of different diameters to be set vertically and connected below by a tube, so that water may pass freely from one to the other. If water be then poured in, it will rise to precisely the same height in both vessels, however much these vessels may differ in size. This apparent *balancing* of the larger column by the smaller constitutes the so-called paradox. Though the *total* pressure on any horizontal section of the larger column is greater than the total pressure on the corresponding section of the smaller, yet the pressure on unit area of these surfaces is the same, and this is the necessary and sufficient condition for equilibrium. The truth implied here is precisely the same as that which is stated in the popular saying, 'Water seeks its own level.' Suppose now that the cross-section of the smaller column is unit area, and that of the larger a. Then if p be the pressure exerted on the former, pa is that exerted on the latter. If an increased pressure be applied to the smaller surface so as to lower its level by a distance x, the larger surface will be raised through a distance $\frac{x}{a}$; and, therefore, the work done in both cases being the same, $Px = W\frac{x}{a}$, when W is the whole weight raised, and is evidently greater than P in the ratio of $a : 1$. Accordingly if $a = 100$, the weight which a power P can raise is $100\ P$; so that by increasing the relative dimensions of the larger cylinder, a greater weight can be raised, though, of course, at a correspondingly smaller rate.

Hydrostat'ics. See HYDRODYNAMICS.

Hydrosulphu'ric Acid, or **Sulphuretted Hydrogen** (H_2S), a strongly odorous and colourless gas, evolved from decomposing albuminoid substances, such as rotten eggs. It emanates from the soil in many volcanic districts, and occurs dissolved in certain mineral springs—those, for example, of Harrowgate, Aix-la-Chapelle, Barèges, &c. Artificially it is readily prepared by the action of a strong acid upon certain metallic sulphides. The most convenient for this purpose is sulphide of iron (FeS), which, if treated with dilute sulphuric acid, results in the evolution of H. A.—leaving sulphate of iron behind in solution. It may be prepared by the action of hydrochloric acid upon sulphide of antimony (Sb_2S_3), H. A. and chloride of antimony ($SbCl_3$) resulting. This gas is condensable to a colourless liquid under seventeen atmospheres of pressure at 10° C. It burns readily in air, producing sulphurous anhydride (SO_2) and water. At 18° C. 1 volume of water dissolves 2½ volumes of H. A.; and this aqueous solution is of prime importance in the laboratory to the analytical chemist. When solutions of certain metallic salts are treated with solution of H. A., the corresponding metallic sulphide is precipitated. The salts of another set of metals, whose sulphides are soluble in, or are acted upon by, strong acids, require for the precipitation of the sulphide the addition of ammonia to neutralise the hydrochloric acid, which is a necessary resultant constituent in the

reaction. A third group gives no precipitate either in an acid or a basic solution. Copper, lead, bismuth, silver, antimony, &c., exhibit the first action; iron, zinc, nickel, cobalt, manganese, &c., the second; and magnesium, barium, sodium, potassium, &c., the third. H. A. is poisonous when inhaled; but its solution, introduced into the stomach, is not injurious, and has, besides, valuable medicinal properties.

Hydrothor'ax (Gr. *hydōr*, 'water,' and *thorax*, 'the chest'), or **Water in the Chest**, is the term applied to effusions of serum into the cavity of the chest, which may occur in either or both sides. It is generally the result of pre-existing disease of the pleura, lungs, heart, or great vessels; or of zymotic or constitutional diseases. The fluid, which varies in quantity, may be limpid and colourless; but it is generally citron-coloured, and contains fibrine, albumen, and sometimes urea, when complicated with Bright's disease of the kidneys. H. is occasionally the result of slight pleurisy, rarely of severe; and, when secondary, it may co-exist with almost every chronic affection of the liver, kidneys, or heart; and is then generally preceded by swelling of the legs and eyelids. The physical symptoms are dulness on percussion; bronchial and sometimes tracheal respiration; bronchophony, and occasionally ægophany; and the absence of expansion, on respiration, on the side of the seat of the effusion. H. is an extremely serious disease, and its treatment is difficult. Tapping by means of the trocar and canula may be performed under the following circumstances—(1) When there is severe permanent dyspnœa, the fluid filling, or nearly filling, the pleural cavity; (2) when there are occasional attacks of orthopnœa, threatening death, although the fluid may not more than half fill the cavity; (3) when means for absorption by other methods have failed; (4) in chronic idiopathic H. with extensive effusion. See *Clinical Medicine* by Professor Gairdner.

Hydrozo'a, one of the two classes into which *Cœlenterate* (q. v.) animals are divided. The H. differ from the remaining class, that of the corals and sea-anemones (*Actinozoa*) in the non-possession of a stomach sac, and in the fact that the reproductive organs are external in the H. The H. are represented by zoophytes, jellyfishes, and allied forms; many other forms being of compound nature. The following are the orders into which this class is divided:—

	ORDERS.	
Sub-class 1. HYDROIDA,	1. *Hydrida*, . . .	Ex. Hydra.
	2. *Corynida*, . . .	Ex. Cordylophora.
	3. *Sertularida*, . .	Ex. Sea-firs.
	4. *Campanularida*,	Ex. Campanularia.
Sub-class 2 SIPHONOPHORA,	5. *Calycophoridæ*, .	Ex. Diphyes.
	6. *Physophoridæ*, .	Ex. Physalia.
Sub-class 3 DISCOPHORA, .	7. *Medusida*, . .	Ex. Jellyfishes.
	8. *Lucernarida*, .	Ex. Lucernaria.
Sub class 4. GRAPTOLITIDÆ,	... ...	Ex. Graptolites (extinct).

Hyères', an old town in the department of Var, France, 8 miles E. of Toulon, romantically situated on a steep rocky hill, commanding a splendid view of the Mediterranean (3 miles distant) and the Isles d'Hyères (Porquerolles, Point Gros, du Levant, &c.), called by the ancients Stœchades. Besides its quaint old ramparts, it has a church of St. Louis of the 13th c. and remains of a Roman villa. There is an active trade in oil, wine, and fruits. The summer is delicious, but the winter is cold and rainy. Pop. (1872) 5197.

Hygiei'a (Gr. 'health'), the ancient Greek goddess of health, was the daughter or wife of Æsculapius (q. v.), in whose temples, as at Athens, Argos, and Corinth, she usually shared. Conceived as the goddess of mental health, she was sometimes even identified with Athena. Works of art display her as a long-robed maiden feeding a serpent from a cup.

Hygiene (Gr. *hygieinos*, 'good for the health') is that department of medical therapeutics which treats of the preservation of health, and discovers proper means for the continuance of that state, and for the prevention and arrest of constitutional diseases. H. has respect to man in his social as well as in his individual condition. The laws of H. have reference to man in the different stages of his existence, viz., during the periods of development, maturity, and decay; to his congenital condition, as regards robustness or delicacy of organism, and liability to constitutional diseases; to his geographical position in the globe, as regards temperature and climatology generally, and also to the race to which he belongs. The chief subjects of H. are diet, air, water, beverages, and condiments; conditions of soil, habitations, clothing, cleanliness, exercise, individual hygienic management, the disposal of the dead, preventible diseases, disinfection, and statistics. Many valuable contributions have been recently made to H. both in this country and on the Continent, but the best is a *Manual of Practical H.*, by Dr. Parkes (4th ed. Lond. 1873). See also *The Management of Infancy*, by Dr. Combe, edited by Sir James Clarke (9th ed. Lond. 1860), and *Public Health*, by Dr. Parkes (Lond. 1876).

Hygrom'etry (Gr. *hygros*, 'moist,' and *metron*, 'a measure') is the branch of meteorological science which treats of the state of the air as regards the moisture it contains. At all times the atmosphere contains a greater or less quantity of water vapour; and the maximum quantity which a given volume of air can hold in given circumstances depends upon the temperature of the air. The higher the temperature the greater is the amount of water vapour which can be held in suspension; and when the atmosphere contains nearly this maximum quantity, it is said to be *saturated*. In these circumstances a slight fall of temperature will be almost certainly followed by a deposition of moisture, either in the form of dew or rain. The temperature at which this *first* deposition occurs is called the *dew-point*, and its determination is obviously a measure of the relative humidity of the air, the temperature and barometric pressure being of course known. The general humidity may be indicated in several ways—for example, as in Saussure's hygroscope, by a hair which elongates when moist and contracts when dry, or by a piece of catgut which untwists when moist and twists when dry. Such, however, can give no quantitive indications, and cannot therefore in strictness be called *hygrometers*. All true hygrometers measure the humidity as suggested above by determining the dew-point. Daniell's hygrometer consists of a U-shaped tube inverted, and terminated at each end by a bulb. The one bulb contains a quantity of ether and a delicate thermometer immersed in the liquid, while the other contains nothing but vapour of ether. The exterior of the latter is covered with some fine muslin-like fabric, and on it when the determination is to be made a few drops of ether are dropped. The evaporation of this ether produces intense cold, which condenses the ether-vapour in the bulb; and as a natural consequence the liquid ether in the other bulb evaporates, rapidly cooling during the operation till its temperature reaches just below the dew-point, when, of course, deposition takes place on the exterior surface of the bulb. Read on the enclosed thermometer the temperature of first deposition, and then take the reading when the dew disappears as the temperature rises. The mean of the two gives the dew-point. Regnault's hygrometer is constructed upon the same principle; but the ether, which is placed in a glass tube covered externally with a thin coating of silver, is evaporated by forcing air through it. Its indications are much more exact than those of Daniell's. The hygrometer in most general use is, however, that which is known as the *wet-and-dry-bulb* thermometer. Two similar thermometers are fixed side by side, the bulb of the one being covered with muslin which is kept moist by the capillary action of a few threads of darning-cotton which lead into a small vessel close at hand. This covered bulb is therefore always cooler than the other on account of the evaporation which is always going on, and which is greater the drier the surrounding air is. The nearer the readings of the two thermometers are, the more moist must the atmosphere be.

Hyk'shos (*hyk*, 'ruler,' and *shasu*, 'shepherds or nomads'), is the name given to the chiefs of some Arabian or Phœnician tribes who invaded Egypt probably in the 16th c. B.C., and maintained a dominion there by force for 100 years. Their first king was *Saites*, or *Salatis*, or *Set*, who fixed his court at Memphis, founded the city of Abaris, near Pelusium, and levied a corn tax in Lower Egypt, the Egyptian King Rasekenu still holding Thebes. The British Museum papyrus calls the H. 'lepers.' *Saites* was succeeded by Beon, Apechnas, Apophis, Janias, and Asselto. The insulting demand for workmen and materials to build a temple to the strange god *Suteck* or *Set* at last roused the Egyptians to combined resistance, and about 1450 B.C. *Chebros-Amosis* or *Aahmes*, the founder of the 18th native dynasty, drove the H., to the number of 240,000, out of the land, a number of the lower people remaining to work as slaves along with the Israelites. It is probable that the Potiphar

who promoted Joseph was a shepherd king at Heliopolis. It has also been suggested that the H. are the people named by the Israelites *Philistines* or *foreigners* (a name which they apparently carried from *Pelusium* to *Palestine*). It is also said that the H. were Caphtorites from the island of Caphtor in the Eastern Delta (*cf.* Gen. x. 14; Deut. ii. 23; Jer. xlvii. 4).

Hylæosau'rus (Gr. 'tree lizard'), a genus of extinct reptiles, belonging to the order *Deinosauria*. Their remains occur in the Wealden formations of the S.E. of England. The familiar species is *H. Oweni.* H. appears to have had an exoskeleton of scales and bony tubercles; the teeth were of small size, and were closely set; and the tail was long. Probably the back was provided with a spiny crest, such as is possessed by many living lizards.

Hy'men, or Hymenæ'us, in Greek mythology, was the god of marriage, and, according to one legend, the son of Apollo and one of the Muses, according to another, of Dionysus and Aphrodite. He is represented as a fair, winged youth, bearing a bridal torch and veil, and taller than Eros. He was invoked in the *Hymenæus* or bridal-song, of which the *H. O Hymenæe* of Catullus is a beautiful example.

Hymenop'tera (Gr. 'membrane-winged'), an order of *Holometabolic* insects, undergoing a complete metamorphosis, and represented by the wasps, ants, bees, hornets, and allied forms. The wings are four in number, and are wholly membraneous; the *nervures* or supporting ribs of the wings small and slender. The head is large, and in addition to the compound eyes, has three *ocelli* in simple eyes. The mouth partakes of the character of the masticatory or biting variety, combined with the suctorial form of mouth. The abdomen bears at its extremity appendages modified to serve as ovipositors (as in saw-flies) or (as in bees, &c.) for a sting or *aculeus.* The larvæ are quite unlike the perfect insect, and are usually short, cylindrical, and footless. The chrysalis has the limbs free, and is usually contained within a slight silky cocoon, which, however, in the saw-flies is thick. The H., according to Dana, exhibit the *normal size* of the insect type. The antennæ or feelers are short; the thorax is rounded; and the abdomen numbers seven segments in the males and six in the females. The H. inhabit the warm and temperate regions of the earth, and in habits are more terrestrial than most other insects. In the exhibition of instincts of a very high order, they differ widely from other groups of insects, and are grouped in many cases into *social communities.* It is to be noted, however, that the acts of bees, wasps, and ants are to be accounted of *excito-motor* kind, that is, depending for stimulation and direction upon external circumstances, of which the insect has no intelligent appreciation. The young ant or bee, liberated from its chrysalis, at once enters upon its duties, and performs them as perfectly as at the close of its existence. No experience is afforded the insect. The H. first appear in a fossil state in the Jurassic rocks.

Hymett'us, a mountain in Attica, subdivided into the Greater H.—now *Telō-Vuni*, and the Lesser H.—now *Mauró-Vuni.* It was anciently covered with woods, and was and is famous for its honey—

'There flowery hill Hymettus, with the sound
Of bees' industrious murmur.'

Hymn (Gr. *hymnos*), an ode in praise of a deity. The earliest examples of the H. in Greek literature were those known as the *Homeric hymns*, which are partly epic in character, while the later hymns of Pindar and Callimachus are lyrical. There are several hymns in the Vedas, but the crowning examples of this form of poetry are the Psalms of David. The early Christians produced many noble Latin hymns, *e.g.*, the *Te Deum* (q. v.), the *Gloria in Excelsis*, and the *Tersanctus.* Until the 10th c. many hymns were composed in Greek by Clemens Alexandrinus, Gregory Nazianzen, John Damascene, Andrew of Crete, Metrophanes, &c.; while down to the 15th c. a rich Latin hymnology, generally fervent, musical, and sonorous, was produced by Ambrose, who founded a school of hymnists, Prudentius, Fortunatus, Gregory, St. Bernard, Peter Damiani, Hilderbert, Hildegarde, Thomas Aquinas, Thomas a Celano, author of the *Dies Iræ* and *Veni Creator Spiritus;* Jacopol, author of *Stabat Mater*, &c. In England hymnology arose after the Reformation; among the chief English hymnists being Herbert, Ken, Baxter, Mant, Doddridge, Toplady, Watts, Wesley, Montgomery, Heber, Keble, Lyte, &c. See Neale's *Hymns of the Eastern Church*, Mrs. Browning's *Greek Christian Poets*, Koch's *Geschichte des Deutschen Kirchenlieds*, Mone's *Hymni Latini Medii Ævi* (Friburg, 1856), and *Hymns Ancient and Modern, with Accompanying Tunes* (revised and enlarged edition, 1875).

Hy'oid, a bone situated at the base of the tongue, between the chin and the thyroid cartilage of larynx. It is shaped somewhat like the letter U, hence the name, from U, the Greek letter *upsilon*, and *eidos*, 'shape.' Although comparatively small in man, it attains great size, complexity of structure, and functional importance in the lower vertebrates. See *Lessons in Elementary Anatomy*, by St. George Mivart (Lond. Macmillan & Co. 1873, page 123).

Hyoscy'amus, the genus of plants to which the Henbane (q. v.) belongs.

Hypa'tia, the daughter of Theon the Younger, a mathematician, was born at Alexandria, between A.D. 370 and 380. She was thoroughly trained in mathematics and metaphysics, and her brilliant accomplishments lent an additional charm to the loveliness of her person. After the death of Julian the Apostate, like many members of the Neo-Platonic school of Alexandria, she went to Athens, where she probably was admitted to the esoteric theurgy of the younger Plutarch. Returning to Alexandria, she taught philosophy with enthusiasm and success. Synesius, Bishop of Cyrene, was her pupil. The rumours that she married Isidorus, and that she wrote to Cyril about her conversion to Christianity, seem to be without foundation. This noble woman at last fell a victim to the quarrel between Bishop Cyril and her friend, the Prefect Orestes. Fanatical monks at the head of a Christian mob, and probably authorised by Cyril, killed her with great brutality and outrage at the Cæsarea church, March 415. Suidas says H. wrote commentaries on Diophantus and the Conics of Apollonius of Perga. There are several letters from Synesius to H. extant. Her story is the subject of a splendid historical romance by Charles Kingsley.

Hyperæsthe'sia (Gr. *hyper*, 'over,' and *aisthēsis*, 'sensation'), or excessive sensibility, is a disease of the nervous structure, the prominent symptom being exalted irritability. The term H. is more commonly applied to excessive sensibility of the skin, which is sometimes so great that the slightest touch by the finger, and the weight and pressure of dress, occasion severe pain.

Hyper'bola, a central curve of the second order. It is one of the conic sections, and may be obtained by cutting a right cone by a plane, which makes with the side of the cone any angle less than the semi-vertical angle of the cone. For every property of the Ellipse (q. v.), there is a similar property of the H., but the latter is at once distinguished from the former by its infinite branches, and by its asymptotic nature. That is to say, for every such curve there are two straight lines which pass through the centre, and which continually approach the infinite branches of the H., but never meet them—which are, in other words, tangents at infinity. It may be defined further as the locus of points, the *difference* of whose distances from two fixed points (called the *foci*) is a constant quantity. Its equation referred to its principal diameters (a and b) is $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$; and if the asymptotes be taken as the axes of co-ordinates, the equation assumes the simple form $4xy = a^2 + b^2$. When $a = b$, the asymptotes are at right angles to each other, and the curve is called the *equilateral H.* *Hyperboloids* are surfaces of the second order, which are cut by certain planes in hyperbolas. There are two distinct kinds of these surfaces, distinguished as *hyperboloids of one sheet* and *hyperboloids of two sheets.* Their equations are respectively $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$, and $\frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$.

Hyper'bole (Gr. *hyper*, 'over,' and *ballō*, 'I cast'), a figure of rhetoric, especially common in Oriental style, which consists in magnifying an object beyond its natural bounds, not by the introduction of qualities which do not, but by the exaggeration of those which do belong to it. A familiar instance of a H. is that of Virgil where he describes Camilla (*Æn.* vii.) as so fleet that she could skim the waves without wetting the sole of her foot.

Hyperbo'reans (*i.e.*, 'dwellers at the back of the north wind'), the name bestowed by the ancients on a sacred nation said to live beyond the Rhipæan mountains, from a cavern in which issued the cutting blasts (Gr. *rhipai*) of Boreas to the southward. The H., thus sheltered from cold and storms, are represented by Pindar (*Pyth.* x. 56) as free from sin and suffering, abstaining from flesh, and living a thousand years; and Pliny adds that, wearying of their easy life, they leapt, crowned with flowers, into the sea. In Æschylus we find the phrase *tychē hyperboreos*, to signify 'more than mortal pleasure.'

Hypericin'eæ, or **Hyperica'ceæ**, is a natural order of some 220 described species, distributed through the temperate zones and the montane districts of warmer regions. The principal genus is *Hypericum*, consisting of 160 species of herbaceous and shrubbery plants, and it is the only one that represents the order in Europe. Eleven species of it are natives of Britain. In many hypericaceous plants a yellow resinous juice exists, as in the allied order *Guttiferæ* (q. v.); this is much developed in the American species of Vismia, and is collected under the name of American gamboge.

Hype'rion (by the ancients directly derived from Gr. *hyper*, 'above,' and *iōn*, 'going,' but from the length of the penultimate seemingly a shortened form of the patronymic Hyperionion), a Titan, son of Uranus ('heaven') and Gaia ('earth'), and husband of his sister Euryphaessa ('far-shining'), who bore him Helios, Selene, and Eos (the sun, moon, and dawn). Helios himself is styled H. by Homer. The myth is unmistakably of solar origin.

Hyper'trophy (Gr. *hyper*, 'over,' and *trophē*, 'nutrition'), a term in medicine signifying the enlargement of a part of the body from increased exercise, excessive nutrition, or disease processes. The following conditions give rise to H.:—(1) The increased exercise of a part in its healthy function; (2) an increased accumulation in the blood of the particular materials which a part appropriates in its nutrition or in secretion; (3) an increased afflux of healthy blood.

Hy'phen (Gr. *huphen*, 'into one'), a mark (-) implying that two words are connected, *e.g*, self-love.

Hypnot'ics (Gr. *hypnos*, 'sleep'), medicines which tend to produce sleep, called also *soporifics* and *sedatives*. The group consists of cannabis indica, chloral, chloroform, codeia, conium, croton-chloral, hyoscyamus, lupulus, morphia, opium, papaver, sumbul, &c.

Hyp'notism, a name given to a variety of somnambulism produced artificially by causing the person to gaze fixedly at a near object. See SOMNAMBULISM.

Hyp'num, the principal genus of the *Hypnæi*, a large natural order of lateral fruited mosses. The species occur in all parts of the world, and include many of the largest and most ornamental mosses. *H. tamariscinum*, a common British species, is used by the artificial flower makers in the construction of their moss-roses, and other species are used by birdstuffers, &c. H. by modern authorities is broken up into numerous genera or sub-genera

Hyp'ocaust (Lat. *hypocaustum*, from Gr. *hypo*, 'under,' and *kaiō*, 'I burn'), in architecture, hollow cells communicating with each other and connected with an oven or furnace, for the dissemination of streams of heated air under the floor and through the flued walls of an apartment. In the baths of ancient Rome the H. served to heat the water, and to maintain a high temperature in the thermal chambers. A similar arrangement was also adopted in private houses.

Hypochœ'ris, popularly **Cat's Ear**, a small genus of the natural order *Compositæ* ranging under its *Chicoraceæ* or chicory tribe. *H. radicata* is one of the commonest British plants in pastures and other grass grounds. By its vigorous growth and its leaves spreading close to the surface it usurps the place of better fodder within its area, and is therefore a mischievous weed.

Hypochlor'ous Acid (Cl_2O), a powerfully explosive gas, produced by passing chlorine over dry oxide of mercury contained in a tube surrounded by ice. It is dark orange in colour, has a strong chlorine odour, and liquefies at 20° C. under ordinary pressure. It dissolves easily in water; and the solution is a powerful bleaching agent, a characteristic common to its salts, the hypochlorites.

Hypochondri'asis (Gr. *hypo*, 'under,' and *chondros*, 'cartilage'), a disease characterised by uneasiness about the region of the stomach and liver, dyspepsia, extreme sensitivity of the nervous system, depression, apprehension of impending evil, morbid suspicion, aversion to society, and loss of mental and bodily energy. These symptoms frequently increase to such an extent as to result in insanity. *Hypochondrical insanity* is developed when H. passes beyond the control of the will, the entire attention being directed to the state of the system, the sensations being exalted and misinterpreted, and consists essentially in the transference of phenomena, subjective or mental in origin, into what appears to be a real material change appreciable sometimes by others. The sensations, however, may proceed from organic or functional disease, or they may be ordinary sensations, excited and intensified by the act of attention, and ascribed to other causes than those which produce them. Hypochondriacal insanity is one of the principal forms which *melancholia* assumes, and those affected with it are liable to a class of singular delusions, chiefly as regards personal identity and metamorphosis. A patient may imagine that the abdomen or the head is the abode of animals of various kinds; that the body is made of butter or glass; that he has been transformed into some other person, or into an inferior animal; or, more remarkable still, into some inanimate object, as a teapot, a pump-handle, a beer-barrel, or a mutton chop. Such extraordinary delusions are not by any means uncommon among the insane. Such delusions and hallucinations are apt to originate homicidal and suicidal acts, and very frequently do so. See *De l'Hypochondrie et du Suicide*, by Dr. Falret; *Psychological Medicine*, by Drs. Bucknill and Tuke (Lond. 1874).

Hypos'tasis (Gr. 'real being'), in Greek philosophy, meant a real personal subsistence, which was the only meaning the word had before the time of Arius (q. v.). But as the idea of reality in the word also applies to substance and being (Gr. *ousia*), when Arius said there are three *hypostases*, he meant three natures or substances. There being at first no equivalent for *ousia*, H. was translated into Latin sometimes by *substantia*, and sometimes by *subsistentia*. This gave rise to great confusion and much misunderstanding, till the Council of Antioch (341) fixed the distinction between H. and *ousia*, and restricted *substantia* to the latter, leaving H. to be represented by *persona*, which was the proper equivalent of its meaning in the Catholic doctrine.

Hypostat'ic Union is the term used to denote the union of the divine and human natures in Christ. Regarding this union orthodox theology holds—(1) That in the person of Christ the two natures are inseparably united; yet (2) without being mixed or confounded; (3) that none of the attributes of either of the natures is transferred to the other; (4) that it is not a mere indwelling of the divine nature in the human, a moral or sympathetic union, nor a temporary and mutable relation; and (5) that it is of such a nature that Christ is but one person.

Hypoth'ec (Gr. *hypothēkē*, 'a pledge') is a security established by law in Scotland in favour of a creditor over a subject belonging to his debtor. A landlord has a H. over the furniture or crops of his tenant for the current rent. A law-agent has a H. over legal documents in his possession, the property of his client, for his Bill of Costs (q. v.) or Expenses (q. v.). The corresponding term of English law is *lien*. See LIENS.

Hypotheca'tion is a term of maritime law, denoting the security which can be created over a ship for repair in an emergency. The owner does not become personally liable under H.

Hypoth'enuse, or **Hypot'enuse** (Gr. *hypoteinousa scil. grammē*, 'the line that stretches under'), in geometry, is the side which subtends the right angle of a right-angled triangle. The square described upon it is equal to the sum of the squares described in the other two sides.

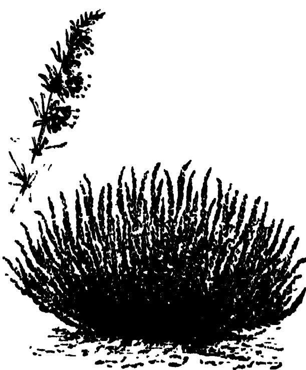
Hypoth'esis (Gr. 'what is placed under'). All hypotheses must be subjected to the test of experiment; but the mere absence of any phenomenon inconsistent with the H. must not be accepted as having much weight in establishing its truth. The grand test of the truth of an H. is not merely that it should explain in a simple manner a variety of phe-

nomena, but that it should indicate existing but still unknown phenomena, and the direction in which to search for these. It is in this way especially that gravitation has been raised to form an H. to a law, as witness the discovery of Neptune; and it is on this ground chiefly that we rest assured of the truth of the conservation of energy. Thus, also, has the undulatory theory of light successfully coped with its rival the corpuscular theory, which had to be abandoned as soon as facts came to light which were demonstratively inconsistent with it. In biology, again, Darwin's theory of natural selection, which aims at accounting for the present distribution of life as a result of evolution, is a very good example of a fruitful H.

Hypsilan'tis. See YPSILANTI.

Hyracoi'dea, an important order of Mammalia founded to include the genus *Hyrax*, of which the *H. Syriacus* or 'coney' of Scripture (see DAMAN) is a typical species, a second species being the *H. Capensis* or 'klipdas' of South Africa, also known to the colonists as the 'badger.' The order H. has been specially constructed for these animals, inasmuch as they do not fall naturally within the boundary of any other order of existing mammals. By many zoologists they were and are placed among the rhinoceroses from the similarity of their molar teeth. But the characters derived from teeth are apt to be deceptive, and as the incisors of the upper jaw grow from permanent pulps like those of the *Rodentia* (q. v.), the H. by other naturalists are included in the latter group. The question of the affinities of H. seem, however, to be most satisfactorily settled by instituting a distinct order, distinguished by having no canine teeth, and four incisors, four premolars, and six molars in each jaw. The front feet have four and the hinder feet three toes, and the digits have hoof-like nails. The collar-bones or clavicles are undeveloped. The nose and ears are short, and the tail is rudimentary. The Placenta (q. v.) is *deciduate* and *zonary*, and thus comes to differ from that of ungulata in which the placenta is non-deciduate.

Hy'rax. See DAMAN and HYRACOIDEA.



Hyracothe'rium, an extinct genus of Mammalia, so named from its supposed affinities to the little *Hyrax* or 'coney.' (See HYRACOIDEA.) The H. remains occur in the Eocene rocks of the Tertiary period. Owen described another fossil which he named *Pliolophus* as forming with H. 'a well-marked section of the odd-hoofed (*Perissodactyle*) herbivores, which preceded the palæotherian family in time, and retained more of the general ungulate type. By some palæontologists the genus *Pliolophus* of Owen is merged into the genus H., a course apparently warranted from a consideration of the very close homologies of the remains. The London clay (Eocene) has afforded the remains of H. in most perfect preservation. The species included under the genus H. may be enumerated as H. (*Pliolophus*) *vulpiceps*, *H. leporinum*, and *H. cuniculus*.

Hyrca'nia, an ancient province of Persia, the modern Mazanderán, was bounded N. by the Caspian or Hyrcanian Sea, E. by the Oxus, S. by the Montes Sariphi (Hazari), which separated it from Parthia, and W. by Mons Koronus and the river Charindas, dividing it from Media. The part of H. near the sea is stated by Strabo to have been extremely fertile, yielding wine, fruits, but no corn; whilst the mountains were covered with dense forests, infested by tigers, and abounding in wild bees. The Hyrcani, according to Xenophon, were subdued by the Assyrians, and Curtius says there were 6000 of them in the army of Darius. The name H. is supposed to survive in the modern Gurkan, a town to the E. of Astrabad.

Hyrca'nus, John, a Jewish prince, and son of Simon Maccabæus, succeeded on the death of his father, B.C. 135, to the government of Judæa and the high priesthood. The country had been at war with Syria, and he was forced to conclude a peace on disadvantageous terms, but in B.C. 130 he threw off the Syrian yoke. He next seized various places in Syria, Phœnicia, and Arabia, conquered the Idumæans, took Shechem, destroyed Samaria and the temple on Mount Gerizim, and renewed the league with the Romans. After this he governed Judæa, Samaria, and Galilee for two years, till his death, B.C. 107.—H. II., the son of Alexander Jannæus, succeeded on the death of his father, B.C. 79, to the government of Judæa and the high priesthood. Three months after the death of his mother, who had survived her husband nine years, he was ousted by his younger brother Aristobulus, who was at first assisted by the Romans. H., however, applied to Pompey, and was by him reinstated in his government, but as a tributary of Rome, B.C. 63. When Antipater was made Procurator of Judæa, B.C. 47, H. was continued in the high priesthood. His grand-daughter Mariamne married Herod the Great, by whom he himself was put to death, B.C. 31.

Hyrtl, Joseph, a celebrated modern anatomist, was born at Eisenstadt in Hungary, 7th December 1811, studied at Vienna, and in 1837 was appointed Professor of Anatomy in Prag. In 1845 he was elected to the Anatomy chair at Vienna, where he has formed a fine anatomical museum. His chief works are *Lehrbuch der Anatomie des Menschen* (1847, 11th ed. 1870); *Handbuch der Topographischen Anatomie* (1847, 5th ed. 1865); *Beiträge zur Morphologie der Urogenitalorgane der Fische* (1850); *Handbuch der Praktischen Zergliederungskunst* (1860). They have been translated into most European languages.

Hyss'op, the genus *Hyssopus*, belonging to the natural order *Labiatæ*. *H. officinalis*, or common H., a native of South Europe, is supposed to be the plant mentioned by Discorides, and it was much cultivated and used in the past as a carminative, &c., Garard recording six varieties in his garden in 1596. It has now fallen into disuse. The H. of our authorised version of the Bible is considered by the best authorities to mean a species of capparis. (See CAPERS.) The hedge H. of the old herbalists is a gratiola.

Hyssop officinalis.

Hyste'ria (Gr. *hystera*, 'the womb') is a disease characterised by convulsive struggling, with alternate remissions and exacerbations, generally accompanied by a sense of suffocation, and probably associated with some morbid state of the emotional or sensori-motor centres. H. has been referred (1) to a morbid condition of the uterus; (2) to a morbid state of the cerebral structures; (3) to a morbid excitability of the whole nervous system implying paralysis of some nervous centres. Post-mortem appearances afford negative results only. H. is divided into three forms—(1) That in which there is the sensation of suffocation, as of a ball rising in the throat—the *globus hystericus*—but without convulsions; (2) that in which the *globus hystericus* occurs with convulsions; and (3) those irregular phenomena which often appear during the intervals of severe attacks. The milder form begins with pains in the left side, or some part of the abdomen, and there is usually nervous excitement or depression, followed by the sensation of a ball, rising apparently from the lower portion of the abdomen, and proceeding upwards, with various convolutions, to the stomach; and thence to the throat, causing an intense sense of suffocation. The attack is followed by headache, stiffness of the neck, copious discharge of urine, and great flatulent distension of the abdomen. In the more severe cases, when the *globus hystericus* reaches the throat, the patient falls, apparently unconscious, and violently convulsed, the convulsions being sometimes so strong that several persons may be required to restrain the patient, who writhes to and fro, agitates the limbs, beats the breast, tears the hair, screams, shrieks, laughs, cries, and sobs alternately. The veins of the neck are distended, and the carotids beat with violence; the respiration is slow and laborious, owing to spasms about the pharynx and glottis causing the patient to grasp the neck and throat. The head is generally thrown back, so that the throat projects; the eyelids are closed, but tremulous; the nostrils distended; the jaws often firmly clenched; but there is no distortion of the countenance, and the cheeks are at rest. In severe cases there may be loss of consciousness, but this is not a common accompaniment of the convulsions of H. The fit may last from a few minutes to two or three hours. H. is frequently connected with menstrual disorder. Pains under or in the

mammæ—the *hysterical breast* (*clavus hystericus*)—lumbar pains, and palpitation, are common; but the morbid sensibility is chiefly in the integuments. The pain of H. is increased when the attention is directed towards it, but lessens when the attention is withdrawn. The convulsive paroxysms of H. may be mistaken for epilepsy; but there is never complete loss of sensibility and perception. H. is not attended with ultimate danger either to body or mind. The first thing to be done during the fit is to loosen everything tight about the person; to admit a free current of air, and to drench the face and head with cold water; for the hysterical state is one from which the patient can be roused, and, in this respect, it is markedly dissimilar to that of epilepsy and apoplexy.

Hys'trix. See PORCUPINE.

Hythe, one of the Cinque Ports, Kent, England, 77 miles by rail S.E. of London. It lies in a hollow nearly a mile from the coast, and consists mainly of one long street. In the 16th c. it was one of the chief ports in the Channel, but since then has greatly declined. Its prosperity revived during the French war, large forces being stationed in the town, and considerable military works being undertaken, but it has again lost much of its importance. It contains a fine old church about to be restored, two hospitals, a gaol, the National School of Musketry, and a theatre. The neighbouring country is rich in fine ruins and antiquarian remains, Saltwood, Lympne (the *Portus Lemanus* of the Romans), Snowfall Castle, &c. Folkestone, Sandgate, and other places are comprised in the parliamentary borough of H., which returns one member to Parliament. Pop. (1871) of the municipal borough, 3383; of the parliamentary borough, 24,078.

I.

the third vowel and ninth letter of the English alphabet, occupying the same position as in the Latin. Its Greek name, *iota*, as well as its form, is directly derived from the Phœnician *jod* or *yodh*, which was not a vowel, but the consonant *y*. Its proper phonetic value is the long narrow sound, never heard in native English words, but represented in unscientific transliteration by *ee*. The English sound of *I* is properly a weakened representative of the diphthong *ai*. In the diphthongs *ei* and *ie*, the original sound of the vowel is generally preserved. Being the least emphatic of the vowels, *I* is liable to be interchanged with any of them, and is commonly introduced as a mere connecting sound, or as an enclitic particle, especially in Greek. For interchanges, Lat. *pingere* = Fr. *peindre*, Eng. 'paint;' Lat. *bibere* = Fr. *buvoir*, Ital. *bevere*. The form of this vowel is also insignificant. Comp. 'not one jot nor one tittle.'

As a numeral, I. stands for 'one' both in the Roman and Arabic notation. As an abbreviation, I.H.S. stands for *Jesus Hominum Salvator*, whereas IHS, without the stops, is said to represent the first three letters of the sacred name.

Iam'bics (from Gr. *iaptō*, 'I assail,' because first used by the satiric writers), a metre consisting of iambi (⏑ –) or equivalent feet, said to have been invented by Archilochus (q. v.). All I. agree in requiring a cæsura or pause in the middle of the verse, but they differ in the number of their feet, the commonest variety, the tragic trimeter, containing six. Drayton employed this metre in his *Polyolbion*, *e.g.*—

When Phœ | bus lifts | his head | out of | the win | ter's wave;

but the decasyllabic or pentameter blank verse and heroics of the English dramatists and epic poets are the forms of iambic metre most familiar to us.

Iam'blichus of Chalcis in Cœle-Syria, the scholar of Plotinus, was a Neo-Platonist philosopher who lived in the time of Constantine, and died about 330 A.D. The centre of his system is a theogony which shows how from the original One, attributeless and beyond the sphere of contradictions, the intelligible world sprang, whence again arose the intellectual world, and from it the psychical. To this latter world belonged all the deities of the Greek and Oriental mythologies, the whole system forming a speculative justification of polytheism in which the Pythagorean mystical numbers play a larger part than any truly Platonic thought. His chief work in ten books, some of which are lost, is the *Peri Aireseos Pythagorou* ('On the Choice of Pythagoras'). The best edition of I.'s remains is that of Kiessling (1813-15). There were other persons of this name in antiquity, but none were noteworthy.

Ianthi'na, a peculiar genus of *Gasteropodous* Mollusca, popularly known by the name of 'violet snails.' They inhabit the sea, and are included in the family *Haliotidæ* or 'ear shells,' but may also form the type of a special family, that of the *Ianthidæ*. The shell exactly resembles that of the common snail in shape. It is of delicate texture, and of a deep violet hue at the base, the spire being white. The foot is small, but secretes a remarkable 'raft' or 'float,' formed of air cells, to the under surface of which the eggs are attached, the animal and its eggs thus floating about at the surface of the water. The I. occur in great numbers on the Atlantic Ocean, and may be driven by storms on the S. coasts of Britain.

Ibarr'a, a town in the N. of Ecuador, at the E. base of the volcano of Cutacache, 60 miles N.E. of Quito. It has some trade in the cotton and sugar of the surrounding country. Pop. 13,200. I. was visited by a severe earthquake in 1868.

Ibe'ria. See HISPANIA.

Ibe'ris. See CANDYTUFT.

I'bex, or **Bouquetin**, a genus of *Capridæ* or goats, scientifically known as the *Capra I.*, and also under the name of Steinbock. The characteristics of this genus consist in the very large size of the horns of the males, which are wrinkled transversely, and have a series of knobs or tubercles on their outer faces. The 'muzzle' is hairy. The I. is found in the Alps and other mountainous parts of Europe; that of the Pyrenees differing only in a few unimportant points from the Alpine I.

Ibex.

I'bis (*Ibis*), a genus of *Grallatorial* or wading birds, belonging to the sub-family *Tantalinæ*, in which the bill is long, slender, and curved, the sides being gradually compressed towards the tip. The wings are long, and the tail even. The inner toe is shorter than the outer, and the hinder toe is long. In the genus I. itself, the nostrils exist in a narrow groove, and the wings have the first and second quills longest. The head is only partly covered with feathers. The allied genus *Geronticus* has been constructed for the reception of several species of I., which have the third and fourth quills longest, and the head almost destitute of feathers, while the tarsi are covered with hexagonal scales. The sacred I. (*I. religiosa*) is one of the most familiar species of these birds. Its colour is a silvery white, the plumage being of loose character. The secondary wing-feathers and the head and neck plumage are black. This bird derives its name from its intimate association with the religion of ancient Egypt. It arrives in Egypt when the Nile begins to rise, and its appearance was doubtless associated with the cause of the rising of the waters. Its food consists of snakes, molluscs, and insects. The scarlet I. (*I. ruber*) has a glossy scarlet plumage; and the glossy I. (*I. falcinellus*) is a third species, which inhabits N. Africa, and which occasionally appears in Britain. Its colour is a very deep brown, almost passing into black. The white I. (*I. alba*), a native of N. America, has a snow-white plumage. The straw-necked I., inhabiting Australia (*Geronticus spinicollis*), has a black head and neck, the lower part of the neck being white, while drooping feathers of a light hue depend from the neck. The back is a glossy black. The remains of these birds occur in the Egyptian tombs. They were embalmed, and received many marks of honour and esteem during life. The feathers were believed to frighten away the crocodile; and as it bred in other lands, the Egyptians believed it to be of miraculous origin. Its food and drink were believed to be of pure kind, and after

Ibis.

death its body was thought to be incapable of undergoing putrefaction. The shape of the body was even taken as symbolical of the human heart, and the hues of the body were held to represent the light of the moon. In the remains of a mummified I., Cuvier was enabled to detect the scales and bones of snakes, which proved the nature of the food of these birds.

Ib'rahim Pasha, a real or adopted son of Mehemet Ali, was born at Cavalla in Rumilia in 1789. After subduing the Wahabis in 1816, he received the command of the Egyptian army, which he organised on European models. He would have crushed the Greeks in 1828 but for the intervention of the Great Powers. In 1831, in the war in Syria against the Porte, he took Gaza, Acre, and Antioch, and with 30,000 troops routed 60,000 Turks at Konieh. He next acted as Governor of Syria. On the renewal of hostilities in 1839, he defeated the Turkish army at Nisib, but foreign interference and the English successes in Syria forced him to retreat to Egypt. He succeeded Mehemet Ali as Viceroy of Egypt, but died soon afterwards at Cairo, November 9, 1848. I. was a brave soldier, and an able if severe administrator.

Ibrail'. See BRAILA.

Ib'sen, Hen'rik, a Norwegian poet, born at Skien in 1828, and now (1877) residing at Dresden. His chief works are dramatic, and divide themselves into two classes—his early dramas, drawn from middle-age history, *Gyldet paa Solhaug* (1856); *Fru-Inger paa Österraad* (1857); *Hærmændene paa Helgeland* (1858); *Kongsemnerne* (1864); and his later ones, *Brand* (1866); *Peer Gynt* (1867); *De Unges Feorbund* (1869), in which subjects from the present time are treated with rare knowledge of human nature and the keenest irony. The last especially entitles him to high esteem, but his lyric poems, of which a collection came out at Copenhagen in 1871, are also very fine. Most think the drama *Kaiser og Galilæer* (1873, English translation by Catherine Ray, 1876) his greatest work. I. received a pension from the Storthing in 1866.

Ice (Old Eng. *is;* Dan. and Icel. *is;* Ger. *eis*), the form which water assumes when it solidifies on freezing. The temperature at which this occurs at ordinary atmospheric pressures is known as the *freezing-point*, and is one of the standard temperatures used in thermometry. (See THERMOMETER.) It is the zero of the centigrade scale, and as such will be regarded throughout this article. If we take a pound of water, say at 10° C., and cool it, we observe that it contracts in volume as its temperature is lowered, until its temperature is very approximately 4° C. This is called the point of *maximum density;* for if the temperature be further diminished, the water expands. This simultaneous increase in volume and lowering in temperature continues till the temperature falls to 0° C., after which no change in temperature is observable. Further cooling results in the transformation of the water into I., and not until it is wholly transformed into I. can a change of temperature be produced. When water becomes I. it undergoes considerable expansion, and therefore ice floats on water. Further, water at 0° C. can have no melting effect upon I. at the same temperature, because there cannot be a transference of heat between them; and conversely ice at 0° C. cannot convert water into I. The freezing-point of water, however, depends not merely upon temperature, but, as shown by Professor James Thomson, upon pressure. Increase of pressure lowers the freezing-point; so that if I. at 0° C. is subjected to an increased pressure, part of it melts. Remove the pressure and it freezes again. This is no doubt the property which makes the formation of a snowball possible, which explains the *fact* of relegation, discovered independently by Dollfuss-Ausset and Faraday, and which affords a *raison-d'être* of glacier-motion. (See GLACIER.) I. has a glassy, transparent appearance, but unlike glass, it is wonderfully regular in its internal constitution, crystallising in most beautiful and varied forms of hexagonal crystals. I. plays an important part in the economy of nature. It frequently exists in the higher regions of the atmosphere as minute crystals, giving rise by the combination of their several reflections to Halos (q. v.) and mock-suns. As snow, hail, and hoar-frost, it is often evident; but it is seen on its grandest scale in the Glaciers (q. v.) of snow-capped ranges, and in the ice-floes of the polar zones. In the Arctic and Antarctic regions the huge glaciers which line the coasts of the snow-clad lands are daily letting loose their pinnacled fragments, which slowly drift towards warmer climes. These icebergs, as they are called, are sometimes of immense dimensions, and are frequently met with as far S. as 37° N. lat., and as far N. as 44° S. lat. The expansive force with which water becomes I. is further a powerful geological agent in the disintegration of rocks and the loosening of soils.

Ice-Trade and Artificial Production.—I. is a substance of great and daily-increasing importance in many industrial operations, in the preservation of food, in the preparation of I.-creams and drinks, and in medical practice, &c. In temperate and warm countries a constant supply can only be maintained either by storing up in suitable I.-houses the natural product of winter, or by the use of some of the numerous forms of freezing machines which have been introduced. Both systems of securing a supply of I. are extensively practised in Great Britain; and in addition to a very uncertain and fluctuating supply obtained from native lakes and rivers during winter, a large and constantly increasing quantity is annually imported, chiefly from Norwegian lakes. The importation of I. into Great Britain began in 1840, when a company was formed for bringing it from Wenham Lake, near Boston, U.S., but that company's I. is now Norwegian. I. has long been artificially produced on a small scale by the use of freezing mixtures, such as a mixture of snow and common salt, a solution of nitrate of ammonia, or of nitrate of ammonia with carbonate of soda, and several other like substances. Most of the machines for manufacturing I. at present in use depend in principle on the abstraction of heat from any liquid operated on by the vaporisation of liquid ammonia or ether. In the first freezing machine used—invented by Shaw in 1839—sulphuric ether was employed. The same agent is used in Harrison's machine, invented in 1856 and improved by Messrs. Siebe in 1862. Carré of Paris in 1860 introduced a machine in which ammonia is employed, which also is the refrigerating medium in Reece's machine, patented in 1867. In Tellier's system pyroligneous ether is used, but he also employs anhydrous liquid ammonia for refrigerating on board ship. Mr. A. C. Kirk of Glasgow produces a freezing temperature by compressing atmospheric air, and extracting the heat developed by the pressure by means of a current of water. On permitting the compressed air so cooled to expand, it becomes sufficiently cold to freeze water. The imports of I. into Great Britain fluctuate enormously, according to the amount of home produce during winter, and partly also owing to the nature of the summer. The growth of the trade is, however, indicated by the fact that whereas the imports in 1854 were not more than 2000 tons, they now (1877) average more than 100,000 tons. The consumption in Continental and American cities is enormous, it being estimated that in Paris as much as 400 tons per week are used. In America the I. trade centres in Boston, whence the material is exported to every tropical country in the world. The American I. industry gives employment to more than 10,000 persons, and engages a capital of about 6,000,000 dollars.

Ice'berg. See ICE.

Ice'land is a large island belonging to Denmark in the N. Atlantic Ocean, about 190 miles from Greenland and 600 from Norway. Its greatest diameter (from E. to W.) is 330 miles, and its area, including the many surrounding islets, 39,690 sq. miles, of which 16,730 are coast-land, inhabited by 70,417 people (1871). All the rest is bare ice and snow-clad mountains (*jöklar*), or valleys of lava or sand, with scanty copse and green-sward here and there. Except on the S., the coast is much indented. The chief inlets are Faxafjördr on the W.; Breidifjördr and Hunaflói, and between them Isafjardardjup, on the N.W.; Skagafjördr and many of less size on the N. and E. The Gulf Stream has great influence on I., as also a Polar current which sends huge icefields against the N. coast about every third year. The greater part of the island is a plateau averaging 2000 feet high, with mountain masses of tufa and trap, resulting from eruptions in the tertiary period. Great volcanic activity exists still, especially in the S., where are Hekla and Kötlugjá. In the interior there is a large lava field, Odadahraun, which has issued from several volcanoes, Trolladyngia, Herdubried (5447 feet), &c., and is continued by a chain of volcanoes up to Husavik in the N. The chief *jöklar* are Vatna or Klofa, with Skaptár, Skeidarar, and Orœfa (in all 3500 sq. miles; greatest height, 6426 feet, of which Mr. Watts reached 6150 in 1875); Hofs, Eyjafjalla (5590 feet), and Snœfells (5976 feet). Skaptár had a frightful eruption in 1783. Mud volcanoes and sulphur pools are very common. Mineral wells (*ölkeldur*, *i.e.*, 'beer

springs') are frequent in the W. Of the many lakes of I., most are very deep, and some have neither affluent nor outlet. They are called *vötn*, and are probably old craters. The largest are Thingvallavatn, Hvitárvatn, and Myvatn. The rivers, chiefly *jökull* streams of unpalatable water, are broad and short (70 to 90 miles at most). The largest in the S. half are Thorsá, Markarfljót, and two named Hvitâ; in the N. Laxá and Lagarfljót, the last as wide in its lower course as the Rhine at Köln. The climate of I. is tolerably mild in the plains, but the atmosphere is generally damp and foggy. The average temperature at Reykjavik is 41·2°. June, July, and August are free from snow. The air is constantly in motion, and fearful storms occur frequently. On the plains of volcanic sand rage great whirlwinds of fog and dust (*mistur*). Auroras and parhelia are not uncommon sights. In the N. of the island the longest day in summer and the longest night in winter extend each to a week. In I. barley, oats, and rye can be cultivated, but their ripening is so uncertain, that it is cheaper to buy corn than to grow it. Many farms, however, have a *tun* or piece of land for grass enclosed with stone walls. From the middle of July to September many of the people leave the coast for the haymaking on the plains in the interior. Three species of birch prevail in I., but seldom reach more than 8 to 10 feet. Only one tree in the island is 25 feet high. In early times trees grew much higher, and some say were large enough for shipbuilding. The lowest plant-region extends from the coast to a height of 1600 feet; the middle one attains to 2660 feet, producing grass and dwarf-birch, great stretches of heather and bilberries, here a source of food, and various kinds of moss, especially the *Icelandic Moss* (q. v.), which, cooked with milk, serves instead of bread in the N. and E. of I.; and the highest, presenting dwarf-willows, *Azalea procumbens*, *Gentiana nivalis*, &c., is bounded by the snow-line 2880 to 3200 feet above the sea. The domestic animal most important to the Icelanders is the sheep. Their wool is not shorn, but torn off when loose, as on the Faröes, and the dung used not more for manure than for fuel. Rot is very prevalent. Horses of a small, sure-footed, mountain breed are much employed in I., and are exported to this country. Many of these live almost wild. In some places their flesh is used for food. Reindeer, introduced in 1770, roam wild in great herds on the plains of the interior. Gnats are produced in immense swarms, especially about the Myvatn. These supply food to birds and fishes, both of which abound in I. The salmon fisheries of Hvitâ and Laxá are very important, and many kinds of fish are found in great numbers on the coast. From February to May, the fishing season, almost all the population live at the coast: 150 French and Dutch ships yearly take part in the codfishing, which is very rich. Sixteen species of seals and whales frequent the surrounding seas, and there are sixty-two species of birds on the island. Ptarmigan, of easy capture and pleasant flesh, swarm on the mountains, and various kinds of birds (eider duck, guillemots, &c.) abound along the coast.

The Icelanders are mainly of Scandinavian blood, and their speech deviates little from the Old Scandinavian. They are in general poor, but honest, patriotic, and well educated. Most of their houses are ill-ventilated and of the meanest description. Their food chiefly consists of fish, bread, and milk in various forms. Dropsy is a very common disease. The principal imports are rye, barley, spirits, coffee, chicory, sugar, and tobacco; the exports—fish, tallow, wool, knitted woollen articles, skins, eider-down, feathers, and Iceland-spar. Each amount to about £130,000. Trade has been free since 1855; and in summer communication is regular from the chief town (Reykjavik) to Leith and Copenhagen.

The Irish probably discovered I. about 800. Between 860 and 870 it was visited by two Norwegians, after one of whom it was called Gardarsholm, a name subsequently changed to I. (from the drift-ice). Many Norwegian district-kings, after the defeat of Hafrsfjord in 872 (see HARALD HAARFAGER), repaired to I. for freedom, the first settlers reaching the island under Ingólfr in 874. In about sixty years all the habitable parts of the island were occupied. Patriarchal government was first instituted; district affairs were discussed in meetings called *Things*, but from 929 a General Assembly or *Althing* met at Thingvalla. Towards the end of the 10th c. the Icelanders discovered Greenland, and about the beginning of the 11th c. the mainland of America. Christianity was established in 1000, largely through the exertions of the Norwegian king Olaf Tryggvesön. Wasting feuds between the chiefs enabled Hakon IV. (Hakonsön) of Norway to reduce I. in 1262-64, after which it prosperity gradually declined. On the union of Norway with Denmark in 1380, I. was transferred to Danish rule. The Reformation struggle lasted from 1540 to 1551. The Althing was abolished in 1800, but re-established in 1843. On January 5, 1874, after a thirty years' conflict, I. received a freer constitution from Denmark. See Sartorius von Waltershausen, *Physisch-geographische Skizze von Island* (Gött. 1847); Thienemann, *Reisen im Norden Europas, vorzüglich in Island* (Leips. 1827); G. G. Winkler, *Island: Seine Bewohner, Landesbildung und Vulcanische Natur* (Brunsw. 1861); P. Schleisner, *Island undersögt fra et lægevidenskabligt Synpunkt* (Copenh. 1849); Zirkel and Preyer, *Reise nach Island im Sommer* 1860 (Leips. 1862); Maurer, *Island von seiner ersten Entdeckung bis zum Untergange des Freistaats* (Munich, 1784); Gröndal, *Um natturu Islands* (Copenh. 1874); R. F. Burton, *Ultima Thule, or a Summer in Iceland* (Edinb. 1875); Watt, *Across the Vatna Jökull* (Lond. 1877).

Iceland Moss (*Cetraria Islandica*), a plant of three or four inches in height, and in colour olive brown, consisting of an erect foliaceous and tufted thallus, having the segments laciniated. I. M. grows very abundantly on the surface of the ground, more especially on mountains, in exposed situations in high northern latitudes, and receives its vernacular name through confusion with genuine mosses. I. M. contains 80 per cent of farinaceous matter, insoluble in alcohol, ether, and cold water, but soluble in boiling water; also a starch-like body called *inuline*, and a bitter principle, *cetraric* acid, soluble in water and alkaline solution. I. M., deprived of its bitter principle, is used as food by the Icelanders, and as a light farinaceous article of diet by invalids suffering from *dyspepsia*, *chronic dysentery*, *phthisis*, and *chronic catarrh*. It is frequently confounded with Irish moss; but neither of the two is a moss; the latter being a small seaweed. See CARRAGEEN.

Iceland Moss.

Ice Plant, the current designation of *Mesembryanthemum crystallinum*, the only species of that immense and truly beautiful genus that is European. In England it is commonly grown in gardens. Both scientific and popular names originate from the plant being covered with watery vesicles which glisten in the sun like fragments of ice.

Ichneu'mon, a genus of small carnivorous animals belonging to the *Viverridæ* or civet family. The genus *Herpestes* includes the best-known species of I. In this genus the legs are short; the feet have five toes; the ears are small and rounded, and the claws large and curved. The hair is long and bristly, and the teeth number forty. The common I. (*H. Ichneumon*) inhabits N. Africa. It is popularly known as 'Pharaoh's rat,' and, like the Ibis (q. v.), appears to have received special attention and honour from the ancient Egyptians. It is still plentiful in Egypt, being domesticated and kept in the house like a cat. The I. is an exterminator of all kinds of reptiles, snakes, lizards, and crocodiles' eggs being greedily devoured by it. The colour is brown variegated with grey tints; the average length about 3 feet. The Indian I. or mungoos (*H. griseus*) is of a grey colour, and is famous for its habit of attacking the Cobra (q. v.), the deadliest of Indian snakes, and for its apparent immunity from the venom of its enemy. The crab-eating I. or urva (*Urva cancrivorus*) is so named from its habit of feeding on crabs, like the crab-eating racoon. Other species of I. are the garangan or Javanese I. (*H. Javanicus*), of a rich chestnut brown; and the banded mungoos or I. (*H. fasciatus*), so named from the dark bands which cross the spine.

Ichneumon.

Ichneumon Fly, the name given to various species of *Hymenopterous* insects belonging to the family *Ichneumonidæ*. The body is long and slender, while the *ovipositor* or egg-depositor is well developed, and exists at the extremity of the abdomen. This organ is protected by a sheath. The larvæ are soft, footless grubs. The eggs of the I. flies are deposited on the larvæ of certain species of *Coleoptera* or beetles, on *Hymenopterous* larvæ, and on those of other insects. The genus I. itself is represented by such species as the *I. suturalis* and *I. paratus*, the larvæ of which are deposited on the larvæ of the *Leucania unipunctata*, a *Lepidopterous* insect. Other genera and species of I. flies are *Evania*, of which the *E. lævigata* is parasitic on the cockroach; *Fœnus*, of which *F. jaculator* infests the nests of sand-wasps (*Crabro*); *Ophion*, of which *O. macrurum* attacks the American silkworm (*Telea polyphemus*); *Anomalon*, of which *A. vesparum* infests wasps; *Pimpla*, of which *P. instigator* is a familiar species, infesting the larvæ of the cabbage-butterfly, and *Microgaster*, exemplified by *M. glomerulus*, also infesting the caterpillars of the cabbage-butterfly.

Ichnol'ogy (Gr. 'footprint lore'), the science that determines the nature of fossil footprints. Many extinct animals have left traces of their movements upon soft formations, such as sand or mud, these formations afterwards becoming consolidated into rocks, which thus bear evidence of the life of the period at which they were formed. It is perfectly clear that I., as a department of palæontological science, is founded upon comparative anatomy. Only the skilled anatomist, who is conversant with the structure of the limbs and feet of existing animals, is entitled to express an opinion as to the kind of foot which may have made an impression upon a once soft formation. The more perfectly the science of comparative anatomy can be applied to the examination of footprints, the greater hope is there of arriving at a just conception of the forms which have made the impressions, and the same opinion must necessarily be expressed with regard to the examination of fossil remains themselves. The department of I. may be said to include the investigation of all traces of animal life, whether consisting of actual footprints or of impressions of other surfaces than those of the feet, or of lower animals which possess no distinct limbs. Thus worm-burrows, the impressions of shells, &c., fall naturally under the consideration of this branch of geological science. The impression of an animal or its hard parts may persist after the animal itself has disappeared through the action of chemical change or of other influences. In other cases, soft-bodied animals, such as sea-anemones, and even the delicate jellyfishes, have left impressions which, in the absence of hard parts in the animals, have, nevertheless, served to perpetuate their existence, and have afforded means of speculating with tolerable certainty on the nature and relations of such organisms. Thus, in the fine-grained lithographic slates of Solenhofen in Bavaria, which in their soft and primitive condition must have been capable of receiving and retaining the slightest and most delicate impression, traces of medusidæ or jellyfishes have been found. Many soft seaweeds are known to us as fossils by their impressions only; and inorganic things, such as raindrops, ripple-waves on a sea-beach, footmarks, and sun-cracks, are similarly reproduced in a fossil and petrified state. Evidence of the existence of marine worms is obtained from the tracks and burrows these worms have left in the sand and mud of their primitive habitations. From the Lower Cambrian rocks up to the present day, annelid tracks are common, and names have been given to the *burrows* (*Scolithus*, *Histioderma*, and *Arenicolites*), although in some cases, and when first discovered, the petrified tracks were described as the fossilised worms themselves. *Scolithus* made long straight burrows; those of *Histioderma* were curved and terminated in a little heap; that of *Arenicolites* is a small burrow formed after a looped fashion; *Grossopodia* from the Silurian rocks exhibits windings and undulations; while one genus, *Palæochorda*, was formerly thought to represent traces of marine plants.

The *Vertebrate* animals, however, are unquestionably those which present examples of the science of I. in fullest detail, and amongst the vertebrates, the reptiles, birds, and quadrupeds are the classes demanding attention from the palæontologist. In 1828 the existence of tortoises in past times was inferred by Dr. Duncan from the impressions of footprints seen on sandstones in Dumfriesshire. Footprints of birds and reptiles are often well preserved, the footprint having first been made on the soft mud or clay of sea-beaches, which may become sun-dried, and adapted to resist the pressure of the matter which covers the impression at the next inflow of the tide; while dry sand may be blown by the wind into an impression and may fill it up. Among the best-known examples of *Ichnites* or fossil footprints are those named *Protichnites septem-notatus*, by Owen, from the Cambrian rocks. These impressions were produced most probably by some extinct crustacean or crablike animal. The famous *Cheirotherium* ('hand-beast') impressions were first described in 1834, and resemble the footprints of a salamander-like animal possessing five toes. The subsequent discovery of the huge extinct amphibians named *Labyrinthodons* (q. v.) afforded the clue to the source of the cheirotherium marks. In 1835 large footprints resembling those of birds were observed in sandstone slabs of Triassic age from the banks of the Connecticut River in the United States. The evidence afforded by these prints tend to show (1) that they are the footprints of a biped; (2) that the impressions are three-toed; and (3) that the numerical progression of the bones of the toes was the same as that seen in existing birds. The largest footprint is 22 inches long and 12 inches wide. The idea that these footprints represent those of birds has been rejected by some palæontologists in favour of the opinion that they are those of extinct reptiles which may have possessed the power of walking upon two limbs.

Ich'thus (Gr. 'a fish'), the name given to the earliest kind of Christian amulets, because the initials of the Greek for Jesus Christ, Son of God, Saviour, made up this word.

Ichthyodor'ulite (Gr. 'fish-spear stone'), the name given to the fossilised fin-spines of fishes, chiefly belonging to the orders *Elasmobranchii* (q. v.), sharks, &c., and *Ganoidei* (q. v.), sturgeons, &c. A few Teleostean fishes, such as the *Siluridæ* or sheat-fishes, also have fin-spines, but these are unknown in the older formations in which I. occur. The earliest remains of I. occur at the close of the Upper Silurian system of rocks. The genus *Onchus* is one of the earliest genera founded upon the characters of the I. occurring in Upper Silurian strata. In Old Red Sandstone or Devonian rocks these fossils also occur.

Ichthyol'ogy (Gr. 'the science of fishes') is a department of zoology not now prosecuted as a distinct branch of science. The day of special departments of natural history—such as conchology, malacology, and the like—has almost disappeared. Apart from its relations to modern science, I. has always held an important place in zoological science. Aristotle and Pliny in classic times, Willoughby and Ray during last century, and Agassiz and Owen at the present time, represent the chief workers in this department. In particular, the labours of the late Professor Agassiz are to be borne in mind as having advanced our knowledge of fossil fishes especially. Agassiz proposed many important modifications of the classification of fishes, the chief of which was a proposal to arrange fishes according to the structure of their scales.

Ichthyop'sida, one of the chief divisions or provinces into which Vertebrate animals are divided. The I. include the fishes and Amphibians (q. v.) (frogs, newts, &c.). The distinctive features of the I., or those, in other words, in which fishes and amphibians agree, consist in the fact that the *blood* is cold and the red blood corpuscles *nucleated;* gills or branchiæ may form, as in fishes, the only breathing organs, or may be conjoined with lungs, as in amphibia. Neither *Amnion* (q. v.) nor *Allantois* (q. v.), are represented in the development of the I. The skull may be altogether wanting, as in the lancelet and the spine may persist as a notochord without developing any distinct bony spine-elements. The occipital condyles of the skull may be double, or only one may be developed, whilst a condyle may be wanting. The *exoskeleton*, consisting of scales, &c., is never developed to any great extent. The digestive system may terminate in a cloaca; when a cloaca is wanting, the intestine terminates in front of the urinary organs. The *heart* may be tubular (lancelet), bilocular (two-chambered, as in fishes), or trilocular (three-chambered, as in amphibia). Two *aortic arches*, at least, exist in the adult, and no *diaphragm* is developed. The *kidneys* simply represent the wolffian bodies of the embryo. No mammary glands are developed. The remaining principal divisions of vertebrata are the *Sauropsida* reptiles and birds, and *Mammalia*.

Ichthyosau'rus (Gr. 'fish-reptile'), an extinct genus of large reptilia, belonging to the order *Ichthyosauria* or *Ichthyopterygia*

(Owen). This group was distinguished by the fishlike form of the body. No distinct neck was developed, and in all probability the body was covered with a smooth wrinkled skin; no traces of scales or any hard covering having been found. The vertebræ were numerous, bony, and markedly bi-concave in form (*amphicœlous*). No sacrum, sternum (breastbone), or sternal ribs were developed. Clavicles or collar-bones were present, and false or abdominal ribs were developed. The orbits or eye-cavities were very large, and the eye had a ring of bony plates in the sclerotic or outer coat. The teeth, which were numerous, were not developed in sockets, but were lodged in a common groove. Both pairs of limbs existed in the form of swimming-paddles, the number of the *phalanges* or finger-bones being very great. In all probability a vertical caudal-fin or tail-fin was present. The remains of I. are exclusively confined to the Mesozoic rocks, being found in the Lias, Oolite, and Chalk. These animals must have been both numerous and large. Specimens have been met with which exceed 20 feet in length. The structure of the vertebræ, the short whalelike neck, and the large development of the paddles, evidently adapted them for a marine life. Along with their neighbours the *Plesiosauri*, they must have roamed far out to sea; and that they occasionally rested on the land is proved by the examination of the shoulder-girdle, which supports the fore-limbs. That they were carnivorous in habits is proved by an examination of their fossil excrement or *coprolites*, which contain fragments of the scales and bones of Ganoid (q. v.) fishes which were contemporaries of the I. in the primitive oceans. Dr. Buckland says that the enormous eye (the orbit in some specimens measuring 4 inches in its largest diameter) of which the sclerotic plates formed the front, was an optical instrument of varied and prodigious power, enabling the I. to descry its prey at great or little distances, in the obscurity of night, and in the depths of the sea. About thirty species are known to geologists.

Ichthyo'sis. See FISH-SKIN DISEASE.

Ic'ica, a tropical genus of *Amyridaceæ*, consisting principally of large trees, belonging to mid-America, and possessing the balsamic juice for which the order is noted. So highly saturated is *I. heptaphylla* with this odoriferous resin that the timber is used for torches, and is called in Guiana, incense-wood. Another species, *I. altissima*, from its fragrant smell, is termed cedar-wood. Like the cedar, it is distasteful to insect vermin, and is consequently in request for household furniture. On account of its large growth, its durability, and the facility with which it is wrought, it is also chosen by the Indians for the manufacture of their canoes. A third species of the same region yields Elemi (q. v.).

I'cicles, in heraldry, are charges similar to the drops in the bearing known as Gussé, but more elongated.

Icil'ius, the name of a plebeian gens which, in the 5th c. B.C., played a leading part in the struggle at Rome between the patricians and plebeians. Seven of the name figure in history, of whom the most important are—(1) **Spurius I.**, who, as tribune of the plebs, in 492, enacted the popular *Lex Icilia*, augmenting the tribunal powers, and in 491 was thrown from the Tarpeian Rock; and (2) **Lucius I.**, who enacted a law assigning the Aventine to the plebs in 496, and six years later headed the outbreak against the decemvirs. See APPIUS CLAUDIUS.

Icolm Kill'. See IONA.

I'cones (Gr. *eikones*, 'images'), pictorial representations of plants. The word is commonly quoted Ic.

Ico'nium. See KONIEH.

Icon'oclasts (Gr. *eikōn*, 'image,' and *klazō*, 'I break') is the name given to those in the 8th c. who were opposed to image-worship in the church, and did their best to put it down. It might be said that the first of the I. was Izid or Jesid, an Arab prince, who in 715 commanded all pictures to be removed from the churches in his dominions. Leo the Isaurian, an Eastern Roman emperor (716), declared himself opposed to idolatry, and first (726) ordered images to be hung higher, that they might not be kissed, and then (730) all to be removed from the churches. His son and successor, Constantine V., published another edict against images (741), and all that had been left were effaced by scraping or whitewashing the walls. By a general council convened by him at Constantinople in 754, severe penalties were enacted for image-worship. But on the death of Leo IV. (780), the Iconolaters were triumphant under his widow, Irene, who convened a council at Nicæa (787), by which the worship of images and of the cross was re-established. Leo the Armenian (813) was a decided enemy to image-worship, but it was restored by Theodora, the widow of Theophilus (died 842), and the consent of the Church given by a council held at Constantinople (869), and confirmed by another in 879. In the West, it was decreed by a council held at Gentilly in 767, under Pippin, that images might be endured 'so that they were not had for worship, veneration, and adoration.' Again, under Karl the Great, a council held at Frankfurt (794) condemned the adoration which the synod of the Greeks had declared to be due to images, although it allowed the use of them.

Icy Cape, a promontory in the N. of Alaska, N. America, on the W. Georgian coast, 160 miles W.S.W. of Point Barrow. It was the furthest point reached by Cook in his voyage through Behring Strait in 1778.

I'da, an offshoot of the Taurus range, in Asia Minor, which, extending from Phrygia into Western Mysia, attained in Gargarus (the modern Kazdag) an elevation of 4650 feet. I. was anciently covered with woods, was the source of countless streams (the Simois, Scamander, &c.), and, according to Homer, abounded in wild beasts. At its western base stood Troy (q. v.), and the entire range is associated with numerous Greek myths. A second I., forming the central and loftiest point of the mountain system of Crete, has been identified with the modern Psiloriti (7674 feet), was sacred to Zeus, who, according to one myth, was brought up on its slopes, and was the home of the Idæan Dactyls, the legendary discoverers of metallurgy.

I'daho, a western territory of the United States, N. America, is bounded N. by British Columbia, E. by Montana and Wyoming, S. by Utah and Nevada, and W. by Oregon and Washington. Area, 86,294 sq. miles; pop. (1870) 20,583, of whom 8915 were Indians, and 4274 Chinese. The chief rivers are Clark's Fork and Lewis or Snake River, both affluents of the Columbia (q. v.), and the Bear River, which falls into the Great Salt Lake. The Bitter Root Mountains, offsets of the Rocky Mountains, attain in their loftiest points an altitude of over 13,000 feet, and the town of Florence (11,100 feet above the sea) is the highest city in the United States. There are numerous lakes throughout the territory. The rainfall is small, but the valleys are extremely fertile, and the mountains clothed with forests up to the snow-line. The discovery of gold in 1852 led to the settlement of I., which up till 1863 formed a portion of the territory of Oregon. It has no railroads, and no good roads of any length. In 1872 the yield of gold and silver amounted to $8,000,000. Lead, coal, iron, and building-stone are also found. The principal towns are Boisé City (the capital), I., Lewiston, and Silver City.

Ide (*Leuciscus Idus*), a Teleostean fish belonging to the carp family (*cyprinidæ*) and to the genus *Leuciscus*, which includes the dace, chub, &c. It is found in lakes and rivers in N. Europe, and appears to ascend the latter in April and May to spawn.

Ide'a is properly the general name for those secondary and less intense feelings which, though they are taken to imply objective excitants that acted at a past time, do not imply their present action. This, of course, applies to those feelings initiated from within, called emotions, as well as to those initiated outside, called sensations. These ideas afterwards form into various relations of likeness and unlikeness, coexistence and sequence, and also into various tracts of consciousness, differing greatly in the clearness with which the separate or successive elements are distinguished. Thus, subject to the control and suggestion of actual sensation, the undercurrent of mental life is made up. This revivability or recoverability of feeling, or rather of clusters of feelings, is the most fundamental fact of mind. The process is one for the most part generally independent of will. There is a scale of facility with which different feelings can be represented; from the intense feelings of sight down to the vague feeling of hunger. The recovery is more difficult in the case of emotions, for some time is occupied in imagining the circumstances calculated to produce it. The ease of recovery also depends very much on the vividness of *pre-*

sent feelings, but this condition is less powerful when the revived and the present feelings belong to different orders; a circumstance which points to localisation of function. Original strength and frequency of repetition are constant conditions of revivability; and the first of these often depends on the temporary state of repair of the nervous centre affected, on the activity of the general circulation, and on the vital character of the blood. An exalted state, produced by exercise, emotion, or even disease, is the most favourable for revival. These conditions must also be allowed for at the time of revival. Indeed, under the influence of opium and hashish, the revived impressions have sometimes more than their original strength. The revivability of relations, or of forms of thought, apart from their contents, stands in a very different position. Whether the compound relations be of coexistence, sequence, or difference, they are more distinctly representable and more enduring in memory. The succession of emotions is more easily recovered than the emotions themselves; and most easily where the emotions are such as to have many relations to other things, including other relations. The same antagonism exists between similar orders of represented relations as in the case of feelings. In the history of philosophy, the word I. has, of course, had many and various meanings. We have the Platonic ideas of the Divine mind, eternal models or archetypes of sensible things, about which alone science is conversant; the sensible species, *aporroai*, or phantasms, which by many of the Greek schools, and generally down to the time of Descartes, were supposed to have an undefined likeness to the external object which they represented; the image of Locke, at least as regards primary qualities; and the Berkleian I. which, far from being a mere species of mental modification, was supposed to have an independent objective existence in the Divine mind when not present to the human. The question whether the I. resembles the *ideatum*, is now generally abandoned as insoluble, man being unable to get outside his own mind, except to the effect of recognising, and to some extent predicting, an order of facts, the essential nature of which is unknown. I. is also frequently used to denote the fundamental conception from which a work of art or a scientific demonstration proceeds.

Id'eler, Christian Ludwig, a Prussian astronomer and chronologist, was born September 21, 1766, at Gross-Brese, near Perleberg. In 1821 he became a professor in Berlin University, and in 1839 was chosen an honorary member of the Institute of France. He died August 10, 1846. His great work is his *Handbuch der Mathematischen und Technischen Chronologie* (2 vols. Berl. 1825–26), which treats fully of the reckoning of time among the ancients.—His son, **Julius Ludwig I.** (born 1809, died 1842), was the author of *Meteorologia Veterum Græcorum et Romanorum* (Berl. 1832), and *Physici et Medici Græci Minores* (2 vols. Berl. 1841–42), &c.

Iden'tity has various meanings. There is the verbal I. satirised by Locke in his chapter on Trifling Propositions (Essay, iv. 8), and of which a specimen is the great ontological maxim 'whatever is, is.' There is logical I., which includes subjects possessing the same attribute or attributes, *i.e.*, belonging to the same species. Hence, the law of I. appears along with these of contradiction and excluded middle as a fundamental law of thought; and from these, formal logicians develop the abstract rules of syllogism, the 'dictum de omni et nullo,' &c. These so-called laws are simply different modes of expressing that we cannot at the same time *believe* both a proposition and its contradictory opposite, and that we cannot at the same time *disbelieve* both. They are conditions of thought, and without them language would have no meaning or title to belief. In an important chapter (ii. 27) Locke discusses the identity and diversity of various classes of substances. Plants and animals are supposed to maintain their I., though the particles of matter composing them are in a state of continual flux. Inorganic substances also are said to retain their I., though subjected to temporary changes of condition. Even the primary qualities may be interfered with without destroying I. These puzzles are avoided by the analysis of material substance into permanent possibility of sensation. But the more difficult question of personal I. remains. Locke (who has on this subject a long controversy with the Bishop of Worcester on the Resurrection) says this may mean (1) the same numerical soul, (2) the same physical animal, (3) the same soul and body together. It is defined by himself as the consciousness of continued existence, but, as he inclined to the belief in an immaterial substance or *ego*, he probably does not differ much from Butler, who said that consciousness presupposed I. In the belief in memory there is no doubt involved more than the mere consciousness of a succession of feelings in time. There is the recognition of the reality of the past feeling; and out of the past and also the expected future there is constantly growing the notion of self, which is not, as some have supposed, a simple and definite idea, but varies according to the particular character and the particular trains of memory, fancy, or expectation with which the character most strongly sympathises. Self accompanies all deliberate acts of consciousness, but not those ideas which, when reproduced, are not remembered. But whether a spiritual self can exist apart from a material self is a point on which neither physiology nor psychology is likely to throw any light. There is an anthropological doctrine of some importance called the psychical I. of the human race. It rests on the number of striking mental analogies observed between the most dissimilar and widely-separated races. Nearly all nations have reached a single or double decimal system. Circumcision was perhaps at one time universal wherever the sanitary reasons existed, and is still much more widely practised than is generally supposed. So with skin-painting, tattooing, flattening the heads of children, sexual connection with a brother's widow, the salute of rubbing noses, the custom of ratifying bonds of friendship by an exchange of names, that of travellers adding each a stone to hill-cairns, the *couvade* or inlying of the father; all these at one time thought to be idiosyncrasies of a particular tribe or nation are now found to exist or to have existed almost all over the world among people between whom there was no possibility of intercourse. In legal proceedings the proof of I. of a human body has often depended on the question whether cicatrices or tattoo-marks might have disappeared, or might have been produced at a certain time; these being among the most durable of bodily signs. A dispute as to I. of sex raises the difficult and fortunately rare question of Hermaphroditism.

Ides. See CALENDS.

Id'iocy is an abnormal condition of the intellect, depending upon defective development or disease during fœtal life; or upon arrested development during infancy or childhood up to puberty. A dement is deprived of powers which he once possessed, but an idiot is characterised by absence of powers which he never possessed. An imbecile is weak in all his mental faculties; but the intellect of an idiot is not only dwarfed, but deformed; while feebleness of will is often as remarkable as deficiency of power of apprehension. There are different degrees of I. depending upon the extent to which the cerebro-spinal system is involved. In the lowest form, the functions of *organic* or *vegetative* life are imperfectly performed; and the functions of *animal* life are likewise impaired, so that he may be scarcely alive to external impressions, and barely possess the power of executing spontaneous acts. In the most abject state of I. he is blind, deaf and dumb, and the excretions are passed involuntarily. There are, however, many grades of intellectual and moral capacity among idiots, and all, except the very lowest, are susceptible, in a corresponding degree, to management, training, and education. It may be stated, generally, that the greater the organic deformities, and the smaller the head, the imperfections of sensibility and intelligence will be the more marked; but the heads of many idiots are unusually large. The chief characteristics of I. are the vacant stare, thick everted lips, the slavering mouth, irregular teeth, squinting, and absence or defect of the senses of sight, hearing, speech, taste, or smell. The extent to which the cerebro-spinal system is involved is frequently manifested by bodily as well as mental deformity, and the idiot is frequently a dwarf, or he may be unable to walk, or to balance himself while sitting, or he may walk with a staggering gait. I. is very frequently associated with epilepsy; cerebral disease, as hydrocephalus; paralysis; disorder of the process of dentition, and general arrest of development during infancy. Some one faculty is frequently exempted from the dulling of the rest, as a perception of tune, an idea of numbers, a mechanical occupation, certain sympathies, and the capacity for imitation; and the measure of success attending educational efforts depends upon a correct appreciation of the dormant or latent capacity. The more celebrated establishments for the education of idiots in Great Britain are at Earlswood, Reigate, Baldovan, Forfarshire,

and Larbert, Stirlingshire. See Seguin, *Traitment Morale, &c. des Idiots* (Par. 1846); *Report to the Legislature of Massachusetts upon Idiocy*, by S. G. Howe (Bost. 1848); Abbot's *Handbook of Idiocy*, Buckminster Brown; *Treatment and Cure of Cretins and Idiots*; and the works of Esquirol, Coke, Prichard, and *Psychological Medicine*, by Bucknill and Tuke (Lond. 1874).

Id'iots and Lun'atics, Law Regarding. They are not chargeable with their acts, however these may be of a criminal nature in the same. It is often exceedingly difficult to determine the line between legal sanity and legal insanity. He who causes a madman to commit a crime is held guilty of that crime.

Idol'atry (Gr. *eidōlolatreia*, from *eidōlon*, 'an image,' and *latreia*, 'worship'). An idol is a likeness or figure of any object worshipped as a divinity, or as representing a divinity. A classification of all the forms of I., which is thus regarded as synonymous with false religion, has been made under the heads of (1) Fetishism (q. v.), or low nature-worship, (2) Shamanism (q. v.), (3) Sabæism (q. v.), or high nature-worship, (4) worship of deceased ancestors, and (5) the worship of abstractions or mental qualities; all other systems being regarded as mixtures or combinations of these five. The religion of the ancient Assyrians and Babylonians was a system of high nature-worship. That of the ancient Egyptians was a phase of Fetishism, being chiefly a worship of animals, &c. The Hebrews were remarkable for their early conception of Monotheism, but there are distinct traces of I. among them down to a late period. The other gods referred to (Josh. xxiv. 2) as worshipped by their fathers must have been the gods of the ancient Assyrians (see Smith's *Chaldean Acc. of Genesis*). The gods or teraphim of Laban, as well as those of Jacob's household (Gen. xxxi. 30, xxxv. 4), were probably connected with ancestor-worship. The I. into which they fell in the wilderness, the worship of Jehovah under the figure of a bull (Exod. xxxii.), and of Saturn (Amos v. 26. *cf.* Acts vii. 43), was a species of nature-worship, as was also the I. of which there are so many traces in their history long after they settled in Canaan. Indeed, they do not seem to have realised till the time of the Babylonish exile that the worship of Jehovah was incompatible with that of Baal, Ashtoreth, the sun, Chemosh, Molech, &c. (*cf.* 1 Kings xi. 1-8; 2 Kings xxiii. 11-13). But, as it has been said, they went to Babylon a nation of idolaters, and returned a nation of puritans. The Christian Church, again, had to contend with the I. of the Greek, Latin, and Celtic races; and it is remarkable how much I. there was lingering in Europe long after it was regarded as being Christianised. Regarding a certain amount of disguised I. which crept into the Church itself, see IMAGE-WORSHIP.

Id'ria, Ober, a town of Austria, in Carniola, and on the Idriza, 30 miles N. of Trieste. Its quicksilver mines are among the richest in Europe, employing 700 men, and yielding 3000 cwts. of metal annually. Pop. (1869) 3813.

Idumæ'a. See EDOM.

Idun', Ydun', or **Idun'a,** in the Northern mythology a goddess of the race of the dwarfs, wife of Bragi (q. v.), who kept in a box the apples by eating which the gods had perpetual youth. A story of the *Younger Edda* makes I. be seized by the giant Thiassi, aided by Loki, who was compelled by the gods to bring her back.

I'dyll, or **Idyl** (Gr. *eidullion*, from *eidos*, a 'form' or 'figure;' Lat. *idyllium*, 'a small image'), was at first strictly a short pastoral poem, a distinction being sometimes made between the *eclogue*, which was said to demand dramatic dialogue, and the I., which demanded mere narration. The I. did not long retain a solely pastoral character. The idylls of Theocritus give glimpses of town as well as country life, though the idea of rural descriptions is still vaguely associated with the spirit of poetry. Tennyson's *Idylls of the King* are only idyllic in so far as they are nonlyrical, and as each tells a complete story.

Ig'lau, one of the oldest and largest towns of Moravia, Austria, on the Iglawa, 130 miles N.W. of Vienna by rail. It has an old Gothic church of St. Jakob, and extensive manufactures of woollen cloths, paper, glass, tobacco, &c. The river is here crossed by a stone bridge. To the E. of the town are two granite pillars, one marking the Bohemian border, the other the spot where Ferdinand I. took the oath of allegiance to Bohemia on its passing to the House of Hapsburg in 1527. Pop. (1869) 17,427. By the Treaty of I. the Emperor Sigismund agreed to observe the Prag Compact, and became King of Bohemia, 5th July 1436.

Ignat'ieff, Nicolas Paulovitch, a Russian general and diplomatist, born about 1830. While still young he became a general, and was sent on a mission to Pekin, where he negotiated a favourable commercial treaty with China. He had for some time charge of the Asiatic department in the Russian Foreign Office, and became Minister at Constantinople, July 26, 1864. Here he exercised great influence over the Sultan Abdul Assiz. On the latter's dethronement and the outbreak of the war with Servia and Montenegro, he strongly championed the Slavonian cause, and an ultimatum presented by him in October 1876 forced the Porte to grant an armistice. He was the Russian plenipotentiary at the Conference at Constantinople, Christmas 1876, and on its failure withdrew with the other ambassadors temporarily from that capital. In March 1877 he visited the principal courts of Europe on the Eastern question, and in London was the guest of the Marquis of Salisbury, his colleague at the Conference, the result of which was the signature of the London Protocol. He is understood to have great conversational powers, to be a master of diplomacy, and to be marked out for even greater advancement in the Russian state.

Igna'tius, Bishop of Antioch, is one of the so-called Apostolic Fathers (q. v.), and is said to have been a disciple of St. John. Eusebius records the tradition that he suffered martyrdom by being torn to pieces by wild beasts at Rome in the reign of Trajan, but whether in 107 or 116 is not clear. There are extant a number of epistles bearing the name of I., regarding which there has been much controversy. From Smyrna, according to Eusebius, he wrote four epistles—to the Churches of Ephesus, Magnesia, Tralles, and Rome; and from Troas three—to the Churches of Philadelphia and Smyrna, and to Polycarp (q. v.). These seven, of which there are longer and shorter copies, have generally been considered authentic and genuine in the shorter form; other five in Greek, and as many more in Latin, have been universally rejected. The circumstance that has chiefly been the occasion of the controversy regarding the seven is that in them the dignity and authority of bishops are exalted higher than in any other writings of the same age. For this reason the epistles have been highly prized and strenuously defended by the advocates of the apostolic origin of Episcopacy, and as strenuously assailed by divines of the Reformed Churches. A Syriac version of three of them, those to Polycarp, the Ephesians, and the Romans, was recently discovered in the Egyptian desert of Nitria. These Syriac copies are shorter even than the short Greek copies, and the passages omitted in the Syriac are chiefly those that magnify the office of a bishop and enforce the doctrine of the deity of Christ. See Cureton's *Anc. Syr. Version of the Epistles of I.* (Lond. 1845).

Ignatius, St., Patriarch of Constantinople, son of the Emperor Michael I., was born about 800. His original name was Nicetas, which he changed to I., when, on the deposition of his father by Leo V. (813), he was forced to become a monk. As such I. was ordained priest by Basil of Paros, became abbot of the monastery of Satyrus at Constantinople, and in 846 succeeded Methodius in the patriarchate of that city. I. was a vigorous opponent of the Iconoclasts (q. v.), and in this opposition was supported by Theodora, the regent for her infant son, Michael III.; but the latter, on attaining majority, was led by the intrigues of his uncle, Bardas, whose vices I. had reproved, to depose I. (858) and secure the election in his place of the iconoclastic Photius (q. v.). Although Pope Nicholas I. refused to recognise the transaction, Photius retained the patriarchate till 867, when, under Basil I. (q. v.), he was in turn deposed and I. reinstated, an eighth general council assembling at Constantinople in 869 to ratify both events. I. died October 23, 878.

Ignatius', St., Beans, the name given by old writers to certain seeds introduced into the Dutch shops about 200 years ago, and extolled as a remedy against cholera. From the quantity of strychnia they contain, their origin is surmised to be a species of *Strychnos*. The genus *Ignatia*, in which they were placed by the younger Linnæus, does not exist in nature; he founded it on specimens belonging to two genera.

Ig'neous Rocks include all rocks which have consolidated from fusion. In their mode of formation they are distinguished

from the other two great groups of rocks—the *aqueous* and the *metamorphic*. The former are produced by consolidation from solution, or by deposition from suspension; while the latter have been altered from their first condition by intense heat or crushing, without, however, being completely fused. If the earth be a cooling body, all rocks must originally have been igneous, so that the ultimate constituents of aqueous and therefore of metamorphic rocks are of igneous origin. I. R. are characterised by an absence of stratification, except such as might result from the flow of one lava stream over another, or from the deposition of successive showers of volcanic ashes and scoriæ. Chemically, all such rocks are composed essentially of silicates, which belong to one of two great classes—the *magnesia* and the *alumina* silicates. For purposes of classification, I. R. are divided into (*a*) *volcanic*, including those which have consolidated at the surface; and (*b*) *plutonic*, embracing those which have formed at some distance below it. Practically it is found more convenient to look upon the latter as consisting of two divisions, *trappean* and *granitic*, the former of which is intermediate to the volcanic and granitic, and is defined only vaguely. The truly volcanic include such rocks as trachyte, obsidian, pumice, dolerite, basalt, doleritic breccias, and tuffs, &c.; the trappean include felstone, pitchstone, porphyrite, diallage rock, greenstone, &c.; and the granitic include the various varieties of granite and syenite.

Ig'nis Fat'uus (Lat. 'foolish fire'), a luminous meteor which is sometimes seen in marshy places, flitting over the ground at a short distance above the surface. Cases are on record of its having been mistaken for a lamp, and the traveller thus decoyed has perished in the bog. It is usually pale blue in colour, but varies much in size and shape, and in the steadiness of its appearance. No satisfactory explanation has yet been given, and the probability is that there are several distinct kinds of I. F. due to different causes. Some may be caused by the escape of phosphureted hydrogen (PH_3), which ignites spontaneously when it comes into contact with the air; others by the combustion of light carbureted hydrogen or *marsh gas* (CH_4); while others may be a species of phosphorescence. It is not confined to true marshes, but is sometimes observed in churchyards and near stagnant pools. Its appearances are most frequent in the autumn or late summer, from a short time after sunset to early morning. It was long an object of superstitious dread amongst the common people, as its various names, of which *Will-o'-the-wisp*, *Jack-a-lantern*, and *Spunkie* are the most familiar, indicate.

Ignorance of the Law, or **Ignorantia Juris**, is no legal extenuation for any crime, offence, or breach of contract. Ignorance of fact may, however, have a material effect in civil questions. See BONA FIDES and CONDICTIO INDEBITI.

Ignoran'tines (*Frères Ignorantins*), called also the *Congregation of Christian Doctrine*, are a Jesuit association founded in 1724 by the Abbé de la Salle. They give instruction gratis in the primary schools, the main aim being to inculcate submission to the hierarchy. They continued to maintain Jesuit influence, even after the regular order had been expelled from France in 1764. When the I. were themselves compelled to leave France in 1790, they possessed twelve institutions there. Taking refuge in Italy, they were allowed to return by Napoleon, who encouraged their labours. Recently they had about 400 institutions, and nearly 700 schools under their management in France. They have also branches in Italy, Germany, Bohemia, England, and Ireland.

Iguala'da, a town in the province of Barcelona, Spain, on the Noya, 40 miles W.N.W. of Barcelona, at the S. base of the Montserrat. It is a gloomy town with a beautiful suburb, and has a trade in wine, oil, fruits, &c., besides manufactures of cottons, woollens, paper, and firearms. Pop. 14,000.

Igua'na, the typical genus of a large family (*Iguanidæ*) of *Lacertilia* or lizards, found in both Old and New Worlds, and distinguished by a very thick, fleshy tongue, divided at its extremity only, and incapable of being protruded from the mouth. The back usually bears a prominent spinous crest or ridge, and the throat has a large dewlap, or fold of skin. The body is covered with imbricated or overlapping scales. The head is broad and flat, and provided with spines or lobes. The eyes have well-developed lids. The genus is divided into two sections. In the one group, represented by American species, the teeth are attached to the inner sides of the jaw-bones. The Old World species, on the contrary, have the teeth attached to the outer aspect of the jaw-bones. The common I. (*I. tuberculata*) is abundant in tropical America. It attains a length of 4 or 5 feet. The colour is green, varied with lines of the same colour, the tail being banded with brown, and the back having a comb-like crest. The throat fold is also mottled on its front margin. The teeth have serrated and compressed crowns, the food consisting of fruits and seeds. The naked-necked I. (*I. delicatissima*) has no tubercles on the neck-skin, and the colour is a bluish-green. Other genera include the horned I. (*Metopoceros cornutus*), and the marbled I. (*Polychrus marmoratus*) of Brazil and Central America.

Iguan'odon, an extinct genus of *Reptilia*, including some of the largest and most remarkable reptilian forms. The I. remains occur exclusively in the Cretaceous or Chalk formations, being especially found in Wealden strata, these latter formations representing a great deposit of estuarine, or delta-like matter. The I. must have attained an average length of 60 feet. It derives its name from the resemblance the teeth bear to those of the living Iguana (q. v.). The thigh measures from 4 to 5 feet in length, and in its smallest circumference about 22 inches. The fore limbs were very small as compared with the hind limbs, and it has been suggested that the I. may have occasionally walked upon the hind limbs alone, thus giving origin to paired impressions of footprints similar to those described in the article ICHNOLOGY (q. v.). The teeth are obtuse, and somewhat triangular. The surfaces are crenated, and present closely set wavy ridges. In old teeth the crowns are found to be worn—a proof that they were used in masticating and triturating the substances upon which the animals fed. In very many points of its organisation the I. appears to exhibit close resemblance to birds. Huxley on this account includes the I. and its neighbours (*Megalosaurus*, &c.) along with a singular little bird-like reptile named *Compsognathus* in one great order of extinct reptiles, to which the name *Ornithoscelida* is given. *I. Mantellii*—named after Dr. Mantell, the discoverer of the genus—is the most familiar form. The hinder feet had three toes only, a fact which may serve to correlate the footprints (usually believed to be those of birds) observed in certain rocks along with those of the I.

Ih're, Johan, a great Swedish philologist, born at Lund, where his father was a professor, March 3, 1707. On his father's death he went to live at Upsala with his maternal grandfather, Archbishop Steuch, and graduated there in 1731. After a scientific tour for three years in Germany, Holland, England, France, and Denmark, he was appointed Professor of Belles-lettres at Upsala University. He died December 1, 1780. His chief works are: *Utkast till föreläsninger öfver Svenska språket* (Upsala, 1745; Stockholm, 1751); *Vetustus Catalogus Regum Suiogothorum* (Upsala, 1752-1755); *Svenskt dialect-Lexicon* (1766); *Ulphilas Illustratus* (*ibid.*, 1759); *Upsalia Illustrata* (*ibid.*, 1762-72), and *Glossarium Suiogothicum* (*ibid.*, 1769), his greatest production, giving the meaning and etymology of all Swedish words.

Il'chester, or **Iv'elchester**, a market-town of England, in Somersetshire on the Yeo or Ivel, 5 miles N. of Yeovil, and 33 S.S.W. of Bath. It is regarded, on account of its position, and of the traces of a Roman wall and ditch, as the *Ichalis* of Ptolemy, and at the *Domesday* survey had six churches, and was the residence of 107 burgesses. King John gave it a charter, which was renewed in the reign of Mary. Formerly it had some industries in silk and thread lace. Pop. (1871) 743. Roger Bacon was born here in 1214.

Ile-de-France, a former province of France, bounded N. by Picardy, W. by Normandy, S. by Orléannais, and E. by Champagne, so called because originally enclosed by the Seine, Marne, Oise, Aisne, and Oureq. It had an area of 9543 sq. miles, and was (1790) subdivided into the departments of Seine, Seine-et-Oise, and Oise, and parts of Aisne, Seine-et-Marne, and Eure-et-Loire. Paris (q. v.) was the capital of I.-de-F., and hence from the 6th c. onwards the history of the province is closely connected with that of the city and its rulers. See CAPET, HOUSE OF; FRANCE; and KAROLINGS.

Iletzkij-Gorodok, a town in the government of Orenburg, Russia, on the Ilek, 6 miles S. of its confluence with the river Ural, and 80 miles S. by W. of Orenburg. Near it are the great

government salt-works, yielding from eighteen to seventy-two million lbs. yearly of the finest Russian salt. The salt-bed is of vast extent and unknown depth, and is only covered by some 4 feet of soil. Pop. 2886. I. was founded by Cossacks in 1737.

Il'eus, Misere'ri Mei, or **Il'iac Passion,** is the term applied to a severe variety of colic, accompanied by obstinate vomiting, inversion of the action of the bowels, and frequently terminating in fœcal vomiting and death. I. may be caused by inflammation, cancer, or structural disease of the intestines; or by some mechanical obstruction. The disease is of the most serious nature, and requires immediate and skilled treatment.

I'lex, the scientific name for Holly (q. v.). I. is also the name of a species of oak, a native of S. Europe, and often planted in this country, called evergreen or holm oak (Quercus I.). This tree is *the* oak of many classical writers. The wood is of good quality, and the bark is used by tanners.

Il'fracombe ('Ælfric's coombe or dingle'), a seaport and watering-place of England, in N. Devonshire, picturesquely nestled in a cove among hills on the Bristol Channel coast, 11 miles N. of Barnstaple. Its harbour, among the best on the S. side of the Channel, consists of a natural basin surrounded by rocks, and is protected by a pier. The fine sandy beach attracts many visitors in summer. There is some fishing, and a coasting trade. Pop. (1871) 4721. I. had formerly a continental trade, and in Edward III.'s time sent six ships to the siege of Calais, while Liverpool only sent one.

Iliss'us. See ATHENS and ATTICA.

Ilha'vo, a town of Portugal, province of Beira, 38 miles S. of Oporto, near the sea-coast, has large glassworks in its neighbourhood at Vista Alegre. Pop. 8200, mostly fishermen.

Ilium. See TROY.

Ilium. The I. is a part of the innominate or pelvic bone, which, with its fellow on the opposite side, along with the sacrum and coccyx, forms the pelvis. In early life the innominate bone is formed of three parts, the ilium, ischium, and os pubis, but these in advanced life become fused together to form one bone.

Il'keston, a town of England, in Derbyshire, in the valley of the Erewash, 8 miles N.W. of Nottingham by rail. Its manufactures are chiefly stone bottles, drain pipes, earthenware, and bricks. I. has held a high position among English spas since the discovery of a spring of mineral water, resembling Seltzer, in 1830. Pop. (1871) 9662. The name I. was anciently spelled *Elchestane.*

Ille-et-Vilaine', a maritime department in the N.W. of France, is bounded N. by Manche and the English Channel, W. by Côtes du Nord and Morbihan, S. by Loire Inférieure, and E. by Mayenne. Area, 2597 sq. miles; pop. (1872) 589,532. I.-et-V. is traversed in the N. by a granitic range, at no point exceeding 800 feet in height, and is watered mainly by the Vilaine and Ille, which unite at Rennes. The soil is poorly cultivated, half the entire surface being heath or forest, but in the N. the plain of Dol yields good crops of cereals, and cider-making is a general and important source of wealth. Cattle-rearing, iron-mining, and linen-spinning are the chief industries, and there are five sea-ports in the department, one canal, and one main railway—the Paris-à-Brest—with two branches. The principal towns are Rennes (the capital), St. Malo, Fougères, and Vitré.

Illegibil'ity, in a material part of a deed, may be fatal to it. See CANCELLING, ERASURE.

Illegit'imacy. See BASTARD.

Illi'cium, a genus of evergreen shrubs or low trees belonging to the natural order *Magnoliaceæ,* inhabitants of both hemispheres. When bruised, the leaves, &c., exhale a strong odour like that of aniseed. The stellate fruit of a Chinese species is commonly used to flavour food among E. Asian nations; it is also taken as a stomachic, and is known commercially as star or Chinese anise. A Japan species (*I. religiosum*) is held in high estimation, and employed in various religious ceremonies by the natives. The leaves of *I. floridanum,* a native of S. United States, are said to possess poisonous properties. See ANISE.

Illima'ni, a mountain in the Bolevian Andes, 24,550 feet high. See ANDES.

Illinoi's one of the United States of America, is bounded N. by Wisconsin, E. by Lake Michigan and Indiana, S. by Kentucky, and W. by Missouri and Iowa. Area, 55,410 sq. miles; pop. (1870) 2,539,891. The surface is extremely flat, consisting for the most part of fertile prairie, interrupted here and there by clumps of oak, black-walnut, sugar-maple, sycamore, &c. The river Mississippi forms the western, the Ohio the southern, and the Wabash, part of the eastern boundary. Other rivers are the I. (500 miles long), Kaskaskia, and Rock River, tributaries of the Mississippi. The geological formation is chiefly Carboniferous; the coal measures are extensive (45,000 sq. miles), but only to a small extent workable. There are 400 mines, yielding annually some three million tons. In the N.W. are rich mines of argentiferous galenga. The climate is generally healthy, but bilious and intermittent fevers are common in the low and swampy bottom-lands of the S. In the bottom-lands the loam, based on clay, is from 25 to 100 feet deep. The chief crops are corn, wheat, oats, hay, rye, barley, buckwheat, tobacco, hemp, and flax. Among the wild animals are the coyote, or prairie wolf, the wild-cat and red-fox; game is abundant, including the hare, wild turkey, prairie rye-hen, &c. The chief industries are flour-milling, the packing of pork and other meats, distilling and malting, and the making of machinery. Chicago, Quincy, Peoria, and Springfield are among the principal cities. I. has a greater extent of railway than any of the other States, there being 6116 miles in 1874. The important I. and Michigan Canal, opened in 1848, is carried from the Chicago River W. for 96 miles to the I. River, thus connecting the great lakes with the Gulf of Mexico. The first white settlements in this region (Kaskaskia, Kaliokia, &c.) were made by the French from Canada (1682), following in the path of the explorer Sieur de la Salle 1679), who here found a tribe of Indians, whom he named in his journal the Illini, and after whom he named the river I. The region fell to the English Government on the conquest of Canada in 1763, and to the United States after the War of Independence. It was converted into a State in 1818. Long struggles with the Indians culminated in what was called the Black Hawk War, which led to their final expulsion from the State in 1832. In 1840 the Mormons removed hither from Missouri, and built the city of Nauvoo, but in an outburst of popular feeling the brothers Joseph and Hyrum Smith were murdered in June 1844, and in the following autumn their followers, to the number of 20,000, left the State under the guidance of Brigham Young.

Illinois Industrial University, at Urbana, 85 miles E.N.E. of Springfield by rail, was opened in 1869, for the purpose of teaching agriculture and the mechanic arts, including military tactics, &c. It received from Congress a land grant of 480,000 acres, and 300,000 dollars from the State of I.; its assets amount to nearly one million dollars, and its annual revenue to 40,000 dollars. There are connected with it experimental farms, nursery grounds, &c. In 1873 it was attended by 338 men and 76 women, and had 13 professors, 9 assistants, &c. The University cannot confer degrees.

Illumina'ti, The, were founded by Adam Weishaupt, who was born at Ingolstadt in the year 1748. Weishaupt was a pupil of the Jesuits, and for some time a professor of canon law. In 1778, along with Nicolai, the Berlin bookseller, and some other Italians and Germans, he founded his society for teaching brotherly love and diffusing knowledge. The members took ancient names, such as Lucian and Spartacus; they called Munich Athens, and Vienna Rome. The organisation included Novice or Minerval, who must be a freemason, the illuminatus minor, 5 degrees of masonry, and 4 degrees of mysteries. The final doctrine taught to the initiated was the disappearance of ranks and inequalities of wealth in society, and the restoration of the patriarchal state by peaceful means, if possible. The leading members or Areopagites were Zwack, Hertel, Berger, Baader, Batz, and Constanza. Zwack projected a sisterhood of illuminatæ and wrote a satire on religion called *Horus,* which was sold at Leipsic fair. The general position of the society seems to have been one of coarse negative criticism of existing forms of religion. In 1782, in consequence of the evidence given by the Masonic Lodge Theodore, the I. were banished from Bavaria, Weishaupt becoming a Privy

Councillor in Saxe-Gotha. The 'German Union' was revived shortly afterwards by Dr. Bahrdt. Illuminism, introduced by Bode, Busche, Mirabeau, and others, to the French masonic societies of the *Chevaliers bienfaisans*, *Martinistes*, *Philalètes*, and *Amis Réunis*, had through the Jacobin clubs an important influence in preparing the Revolution of 1789. See Robison, *Proofs of a Conspiracy* (Edinb. 1797). Nearly a dozen descriptive works were printed at Munich in 1786–88.

Illu'sions are mental phenomena, depending upon a morbid condition of the organs of the special senses, but especially of the organ of sight. See HALLUCINATIONS.

Illyr'icum (Gr. *Illyris*, rarely *Illyria*), a name applied in ancient times to a wide tract of land occupied by barbarous tribes W. of Macedonia and Mœsia, and stretching from Epirus to the junction of the Savus and Dravus. The river Drilo (*Drin*) divided it into two portions—*Illyris Romana* or *Barbara* (the modern Dalmatia, Herzegovina, and Montenegro, with part of Croatia, Bosnia, and Albania), and *Illyris Graeca* (including the greater part of Albania), the former inhabited by three separate tribes—the Japydes, partly Illyrian and partly Celtic, in the interior of the N.; the Liburni, along the coast from the Arsia to the Titius, famous for their seamanship and swift vessels; and the Dalmatæ, who held the coast from the Titius to the Drilo. During the Empire, Illyrian, and especially Dalmatian, soldiers were much employed. *Illyris Graeca*, also called Epirus Nova, was a wild and rugged region, unproductive except on the southern coast, and inhabited by tribes dangerous to the Macedonian kings from an early period. In 229 the Romans, exasperated by their piracy, overran their territory and subjected them to a yearly tribute. The I. of Constantine was one of the great provinces of the Roman Empire, divided into *I. Occidentale*, comprising I. proper, Noricum, and Pannonia; and *I. Orientale*, including Thrace, Macedonia, Moesia, and Dacia.

Il'men, a lake of Russia, in the government of Novgorod, has an area of 340 sq. miles, is 30 miles long and 24 broad, and is connected by the Volchov with Lake Ladoga, which lies 100 miles further N. It receives the Shelon, Lovat, Msta, &c., abounds in fish (bream, sandres, and smelt), and is frequently visited by storms. Its banks were formerly inhabited by the Slavic tribes who called the Russian kingdom into existence by inviting Rurik the Varangian Russ from Sweden to become their ruler in 862. On its N. side lies Novgorod, on its S. Staraja Russa, the capital of a great military colony that surrounds the lake on three sides.

Il'minster, an old market-town of England, in Somersetshire, on the Isle, 13 miles S.E. of Taunton by rail. It has woollen, cloth, and flax mills, chemical works, and brickfields, besides some brewing, tanning, and glove-making. There is an old cruciform church and a grammar school (founded by H. Waldron in 1550), which has an endowment of some £1000, with four exhibitions at Oxford University. Pop. (1871) 2431.

Il Obeid. See EL OBEID.

Ils'ley (East), a market-town of England in Berkshire, on the Downs, 56 miles W. of London, and near the Great Western Railway. Its well-known sheep markets begin on the Wednesday fortnight before Easter, and are held every alternate Wednesday till July. At the great sheep fair (26th of August) as many as 50,000 sheep and lambs have been penned for sale. In the vicinity are several packs of hounds, and the Downs are noted for their coursing meetings. Pop. (1871) 608.—**West I.** (pop. 424) is distant about a mile.

Ilyan'thus, a familiar genus of *Actinozoa* or sea-anemones, differs from its common neighbours by its conical shape, and its slender and pointed base. Probably I. lives with its base attached in the mud of the sea. The family *Ilyanthidæ* includes the nearly-allied genus *Arachnactis*, an anemone which lives a free life, and fixes itself at will. The common sea-anemones, on the other hand, are usually firmly rooted and fixed to rocks and stones. *I. Scoticus*, or the 'Scottish Pearlet,' is a familiar species.

Im'age Wor'ship, in the Christian Church, to which alone the present article refers, began with the use of certain symbolical figures. The earliest of these was the sign of the cross made with the hand. Wooden crosses then began to be set up in various places, and figures to be embroidered on cloth, &c. Next the Good Shepherd or Christ under the figure of a lamb was painted or etched on various articles, especially the chalice used in the eucharist. By and by religious art advanced from symbolism to represent figures partly historical and partly symbolical or ideal—a favourite subject, *e.g.*, being the offering of Isaac, because it symbolised the death of Christ—and then pictorial images, purely historical. In the 4th c. the use of images—of the apostles and martyrs, and pictures of scenes from the Old and New Testaments—increased to such an extent that the walls of churches were covered with frescoes and paintings. (Wooden figures of saints were probably not introduced till the 9th c.) At first these images were intended merely to instruct the ignorant; they were 'the Bible of the poor,' 'the Scriptures of the laity,' but gradually they were credited with working miracles, and in short with a part of the supposed powers of the saints, or of Christ or his mother, according to the representation. Thus Pope Gregory I., in describing the true use of images, points to the very abuse into which ignorant people, not yet weaned from heathen ideas and practices, could not fail to fall. 'They who are ignorant of letters may at least read on the walls by seeing there what they cannot read in books. . . . It is one thing to adore a picture, another to learn by the story of the picture what ought to be adored. . . . If any one wishes to make images, by no means stop him, but by all means stop the worship of images.' In the Greek Church, however, I. W. was avowed, and defended thus: 'That in worshipping the image of God the material wood and colours were not worshipped, but laying hold of the lifeless representation of Christ the worshipper seemed to lay hold of, and to worship Christ through it.' This expresses the principle on which I. W. has generally been defended, a principle which was enunciated by the Council of Nicæa (787; see ICONOCLASTS), namely, that the worship paid the image terminates on the object which it represents. The same council declared that they were not to be worshipped with *latreia*, or the reverence due to God, but with salutations and reverent prostrations. The Council of Trent decreed that to the images of Christ and the saints 'due reverence' should be paid, without defining the nature of that reverence. Among Romish writers various opinions are found on the subject. Some hold that the image itself is not to be worshipped in any sense, but merely that the original is to be worshipped before it; others that images ought properly to be honoured in themselves, but with an inferior honour to that paid to their originals, and hence that no image is to be adored with the worship of *latreia*. Others, again, hold that the same honour is due to the image as to the original, and hence that the image of Christ is to be adored with the worship of *latreia*, that of the Virgin with *hyperdoulia*, and those of ordinary saints with the worship of *doulia*. Regarding the violent controversy which occurred in the Church in the 8th c., on the subject of I. W., see ICONOCLASTS.

Imag'inary Quan'tity, in algebra, is the name given to an *even* root of a negative quantity. For instance, $\sqrt{-a^2}$ has no meaning in ordinary algebra, because $-a^2$ is the square of no possible quantity, positive or negative, integral or fractional. $\sqrt{-a^2}$ may be written $a\sqrt{-1}$; and this symbol $\sqrt{-1}$, or $(-1)^{\frac{1}{2}}$, or (as some put it) $(-)^{\frac{1}{2}}$ is recognised as *the imaginary* or *impossible* quantity of algebra. Its constant occurrence in higher analysis is evidence that it must have some meaning; but not until Sir W. R. Hamilton developed his calculus of QUATERNIONS (q. v.) was this meaning clearly brought out.

Imagina'tion, in the strictest sense of the term, is that faculty of the mind which represents. The mind by means of perception admits new objects within the sphere of consciousness: knowledge thus acquired is retained by memory proper: the ideas stored by memory are reproduced either by suggestion or recollection, and kept continuously before the mental eye by I. Not only do these faculties of retention, reproduction, and representation vary relatively in individuals, but they are together strong or weak in regard to the same class of subjects. Any one, for example, acquainted with Celtic literature will recollect that a vivid sense of colour distinguishes the Cymric and Gaelic bards. Or, again, it is well known that there have been prodigies capable of playing on musical instruments long passages but once heard, who yet were notably deficient otherwise

in mental capacity. From this it may be seen that I. is partial, but only as the subordinate faculties are partial, giving to their work its stamp of greater permanency. It is further to be noted, as a fact well established, that I. depends on no part of the cerebral arrangement exclusively, but makes use of all the organs of sense. Experiment has proved that any part of the brain may be injured or destroyed without impairing the representative faculty, while, on the other hand, injury done to the intracranial portion of any external organ of sense invariably affects that faculty.

In the more popular acceptation of the term, I. becomes not only representative but creative. Choosing among the facts given by memory, it combines and adds to these, and from them produces something which may be unlike anything ever actually experienced. It is not necessary that what it produces conform to truth. It may subtract from any actual combination of qualities—as in the conception of a ghost, which is supposed to have the appearance without the body of a man; or it may add to these—as in the representation of a winged bull. Nevertheless, analysis of such products will show them to be entirely composed of elements previously given in experience. Nor can I., free as it is, escape the laws of thought; there must be a certain congruity in its acts. To imagine a square circle, for example, would be impossible.

I. is commonly represented as courted by art, but shunned by science. No view could be more erroneous. To I. the great majority of scientific discoverers owe their successes, for without its aid no hypothesis could be formed. The Greek poets personified nature by no other act of the mind than that by which later philosophers sought its scientific explanation. In science I. not only leads to actual discovery, but hypothetically explains what can never be directly observed; as, for instance, the sensation of light or colour. It leads the artist from simple observation to conceptions of the beautiful. In morals it gives to each man his individual and ideal end of life, and in religion shapes for him the object that he worships.

Imaum′, or **Imâm** (Arab. 'teacher'), the title of a Mohammedan functionary, whose duties answer somewhat to those of a parish priest—assisting at circumcisions, marriages, funerals, &c. He occupies a pulpit (*mimbar*) in the S.E. angle of the mosque, is distinguished from laymen by the superior height of his turban, is treated with great reverence, but, from the lowness of his stipend, is often obliged to combine some other employment with his religious duties. Two imaums are usually attached to each mosque, under the superintendence of a *khatib*, or higher minister, also called *I.'ul Djumâ* ('Friday I.'), from his performing the solemn noonday service on Friday. The sultan himself, as successor of Mohammed, is known as *the* I.

Imæ′us, a classic derivative from the Sanskrit *hima*, 'snow;' comp. Gr. *cheima* and Lat. *hiems* 'winter' or 'snow-time,' anciently given to part of the Hindu-Kush or the Himalayan range.

Imbatt′led. See EMBATTLED.

Imbecil′ity, or **Fee′bleness of In′tellect**, may be congenital or infantile, depending upon arrested development of the mental powers during foetal life, or, more frequently, during infancy. I. denotes a lesser degree of mental deficiency than Idiocy (q. v.), and, when present from birth, the sensitive and intellectual faculties are somewhat developed, and are susceptible of the influences of education; so that many imbeciles are able to take care of themselves, and to perform many of the ordinary duties of life. The intellect of the *idiot* is dwarfed and distorted; that of the *dement* has been deprived of powers formerly possessed; but that of the *imbecile* is undeveloped or but partially so. Imbeciles are affectionate but passionate, and have frequently a strong tendency to theft; while some are prone to incendiary, and, still more frequently, to homicidal acts, there being in the same person, and at the same time, an absence or depression of the intellectual faculties, and an excess or exaltation of the affective faculties. There are various classes of mental weakness which have special reference to I. In the *first*, the imbecile is incapable of forming a judgment on a new subject, however simple it may be; although he may judge correctly regarding familiar subjects. In the *second*, he is less able to judge regarding his accustomed occupations, being confused especially in regard to time and identity. In the *third*, there is much less self-control, the imbecile being delusive, passionate, suspicious, and misanthropic. I. involves congenital defect in, or arrested development of, the centre of the nervous system essential to the operations of the mind, which is, therefore, capable only of limited improvement. See *Psychological Medicine* by Drs. Bucknill and Tuke (Lond. 1874).

Imbecility does not, by the law of England, prevent a man from managing his own affairs, nor does it protect him from the consequence of his acts. See FRAUD, IDIOTS AND LUNATICS. Scotch law, INTERDICTION.

Im′bros (now *Embro*), an island of Turkey, included in the vilayet of Brusa, 10 miles W. of the entrance to the Dardanelles. Area, 130 sq. miles; pop. 6000. It is well wooded and hilly, rising to a height of 1845 feet above the sea. There is some export of oil, corn, wine, &c. The chief town and port is Kastro; the only other considerable place is Skinudi in the interior.

Imbrued′, in heraldry, signifies bloody, dropping with blood.

Imereth′i, a former independent state of Georgia (q. v.), now included in the Russian government of Kutais, in the lieutenancy of the Caucasus.

Imita′tion, in music, is the succession of similar phrases in different 'parts.' The imitated phrase is called *subject* or *antecedent*; the imitating phrase, *answer* or *consequent*. The answer may vary from the subject in accent, pitch, length of notes, and direction of movement. I. 'serves to develop the ideas, to connect the parts, and to give unity of design to the whole' of a composition.

Im′itative Insan′ity. See EPIDEMIC MENTAL DISEASE.

Immac′ulate Concep′tion is the name of a doctrine promulgated in a bull of Pope Pius IX. (1854), to the effect 'that the Blessed Virgin Mary was (by the grace and favour of Almighty God) preserved perfectly free from all taint of original sin from the very moment when she was conceived by her mother.' It is likewise the name of a festival of the Roman Catholic Church, on the 8th December, also observed in the Anglican Church under the name of the Conception of the Blessed Virgin Mary, and in the Eastern Church, on the 9th December, under the name of the Conception of Anne, the mother of the mother of God. The form in which the doctrine first appeared, was that since God says of Jeremiah, 'Before thou camest forth out of the womb, I sanctified thee' (Jer. i. 5), the same might be said of the Virgin Mary. The earliest authentic historical trace of it, as now understood, appears in an epistle of St. Bernard written (1140) to the canons of Lyons, in which he affirms that the festival, which was observed in the Cathedral at Lyons, and by the Franciscans at Rome, is a novelty in the Church, and condemns the doctrine, although he admits the sanctification of the Virgin in her mother's womb. Half a century later the doctrine formed one of the themes of controversy between the Thomists and Scotists. Thomas Aquinas followed St. Bernard in his moderate statement of the doctrine, and was followed by his order, the Dominicans; Duns Scotus supported the extreme view, and was followed by his order, the Franciscans. Sixtus IV. published two bulls (1477 and 1483) excommunicating all on either side who asserted or denied the belief in the doctrine to be heresy, on the ground that it had not yet been settled by the Holy See. The Council of Trent added to its decree regarding original sin that it did not include the blessed and immaculate Virgin Mary, the mother of God. The controversy still continued, however, till the doctrine was finally imposed as an article of faith on the Roman communion by the bull of Pius IX. mentioned above. See Blunt's *Dict. of Doct.* and *Hist. Theology* (Lond. 1872).

Immemo′rial U′sage. By the law of England, a custom uninterrupted since the beginning of the reign of Richard I. acquires legal validity. See EASEMENT, PRESCRIPTION.

Immoral′ity in Law. While the law protects the good and the bad alike, it will not take cognisance of any transaction, the nature of which it holds to be contrary to public morality. Thus, as it holds betting and gambling to be so, it will not enforce payment of a bet or gaming debt

Immort′ality. The belief in I. has been found almost without exception among the aborigines of America, as well as

among the Polynesians, Papuans, and Australians, among the greater number of Asiatics, among the ancient inhabitants of Europe, and all the Hamites of N. Africa from the Nile to the Canaries. The belief may often be inferred from the mode of burial. Thus, Egyptians provided their mummies with wheat, that they might have seed-corn at the resurrection; the Caribs place maize-seeds, and the Babylonians placed date-stones on the tombs. The sacrifice of slaves, as in the 'Adah' or *great custom* of Dahomey, and the wholesale strangling of wives at the funeral of a Fiji prince, show the same thing. The Hottentots place the corpse in the cramped position of a fœtus, expecting a second birth. This rude belief is not confined to the I. of men. The Itelines of Kamchatka believe in the renewal 'of the smallest fly.' The Jesuit missionaries found that the Inca-Peruvians and many N. American tribes believed in the eternal existence of prototypes or essences. The Fijians add a very practical belief that cocoa-nut trees are also immortal. But many negroes have no belief in I. The Lataka chief said to Sir S. Baker, 'Can a dead man come out of his grave unless he is dug up?' Wherever, among negroes and Polynesians, a distinct worship of departed chiefs is observed, there is apparently belief in I. It has been suggested that the belief rests on dreaming; as negroes have been found who believe in the continued existence of one or two generations, but forget those further back Buddhism is founded on the perpetual transmigration of souls. Confucianism denies I. The doctrine of the resurrection is distinctly taught in the dualistic Iranian religion of Zoroaster. It also appears in the Egyptian trial, and in the creed of the Badagas of India, which compels souls to pass through a column of fire in order to reach the land of the blessed. While the Jews were free from Shamanism (or magic religion), they did not for centuries embrace the Iranian notion of I.—at least the Pentateuch is silent on the subject. The 'grave' or 'hell' of the Old Testament is even less than the Greek Hades—a prison-house of feeble shades who can never revisit the realm of light. The retributions of the just and the wicked were all to be in this life. In the person of Christ the doctrine first became a *clear fact*—he 'brought life and immortality to light in the gospel.' In the Christian theology the doctrine of I. in the form of a heaven reserved for the faithful, and a hell reserved for those unreconciled to God, is of vital importance. Before Mohammed the Arabs did not believe in I. It was this doctrine which specially repelled the higher classes of his countrymen. His paradise was a sensual one in those points in which the Mohammedan character is sensual. The truth of the doctrine of I. is often inferred from the necessity (on the assumption of a just Providence) of redressing the inequalities of the present life. But it is the flood of conviction which Christianity has poured into the human mind that gives any reality to the ethical conception of a 'just Providence.'

Immortelles'. See EVERLASTING FLOWERS.

Imo'la, a town of Italy, in the province of Ravenna, on the Santerno, 10 miles N.W. of Faenza. It stands on the railway between Bologna and Ancona, has some fine palaces, manufactures of leather, oil, wax, glass, silks, bricks, majolica, &c. It was the ancient *Forum Cornelii*, so called because founded by L. Cornelius Sulla. Pop. (1872) 28,328.

Impale'ment, in heraldry, the marshalling two coats-of-arms side by side upon one shield, is effected by dividing it into two equal parts by a vertical line called the pale. Alliance by marriage has been denoted by I. since the close of the 14th c., the husband's arms forming the dexter, the wife's the sinister half; and similarly bishops, deans, and kings-of arms impale their paternal arms with those of their sees or offices. The impaled arms of husband and wife are not hereditary, but may be borne by the survivor of either of them. While, however, a widower marrying again is entitled to bear the arms of both wives, a widow does not bear those of her former husband unless he was a peer. The earliest method of I. was by Dimidiation (q. v.).

Impana'tion (Lat. *in*, and *panis*, 'bread') is a term which was invented by Luther, from the analogy of 'incarnation,' to express the union between the outward and the inward parts in the Eucharist. It is practically synonymous with Consubstantiation (q. v.).

Impeach'ment is an indictment presented by the House of Commons to the House of Lords accusing a commoner of a high political misdemeanour, or accusing a peer of any crime. On the trial of Warren Hastings, a doubt was raised as to whether the House of Lords was bound by the same rules of evidence as bind inferior courts. It was decided that the House of Lords was so bound. The last I. was that of Lord Melville in 1805.

Impeachment of Waste. When an estate in England is given to any one *without I. of W.* he is entitled to cut timber, and has other reasonable privileges; any unreasonable exercise of these may be restrained by injunction from Chancery division. There is no corresponding term of Scotch law; but there are similar privileges and checks.

Impenetrabil'ity, in physics, is an essential property of matter, implying that no two portions of matter can occupy the same space at the same moment of time. See MATTER.

Imper'ative, The Categor'ical, is the central element of Kant's ethical philosophy, and is the name Kant gave to the fundamental law of the pure practical reason. It is called categorical, because it appeals to us directly, independently of all motives outside its own scope, wholly without any reference to the prospect of profit or pleasure to be derived from the course of action it demands, and was thus formulated by Kant: 'Act so that the maxim of thy will may ever stand as the principle of a universal system of law.'

Impe'rial Crown, properly that worn by the German King as Roman Emperor, a crown similar in shape to a Mitre (q. v.). The term I. C. is now applied to all kingly crowns. See CROWN.

Impeti'go, a disease of the skin attacking primarily the mouths of the hair follicles, and giving rise to an effusion of pus. The pustules are usually small, like the vesicles of eczema; but they are sometimes large and confluent, especially on the scalp. They are usually arranged in thickly-set clusters, occupying a small extent of surface, but they are sometimes distributed more or less generally over the surface of the body. When they burst, there remains a rough, yellowish, transparent crust of considerable thickness. The mode of distribution of the pustules, the locality and the severity of the disease, give rise to the nomenclature of varieties, as *I. figurata*, *I. sparsa*, *I. scabida*, *I. erythematica*, *I. capitis*. Treatment:—During the inflammatory stage, emollient and sedative fomentations, and water dressings; afterwards a coating of the benzoated oxide of zinc ointment, a weak solution of nitrate of silver, a liniment of olive oil and lime-water, or of glycerine and carbolic acid in the ratio of 1 to 20.

Impeyan' Pheasant, or **Mo'nal** (*Lophophorus Impeyanus*), a genus and species of Rasorial birds belonging to the family *Phasianidæ* or pheasants, and distinguished by having the bill broad at the base, the upper mandible projecting over the lower. The nostrils are partly covered with feathers, and the wings have their fourth and fifth quills longest. The tarsi are spurred in the males, and covered with large scales. The head and throat are green, with a metallic lustre, the former bearing a crest consisting of quills with broad extremities. The lower part of the neck and upper part of the back are purple, and the tail is reddish brown. A snow-white line marks the middle of the back. The rest of the plumage is of a bluish tint. The colour of the females is brown. The food consists chiefly of roots. The I. P. inhabits the upper regions of the Himalayas.

Impon'derables was the name given to light, heat, electricity, and magnetism, when these were supposed to be material. See ENERGY.

Importa'tion and Exporta'tion. Commodities brought from foreign countries and articles of home produce sent abroad are called imports and exports respectively. Under each country a statement is given of its imports and exports. Among articles the importation of which into Great Britain is forbidden, are copyright books, false money, extracts of coffee, tea, &c., snuff-work, immoral books and prints. See CUSTOMS DUTIES.

Im'ports and Ex'ports. See BALANCE OF TRADE.

Impos'ture. See BEGGARS, LAW OF ENGLAND RELATIVE TO.

Im'potency, in law, is valid ground for either a husband or a wife having the marriage dissolved by law.

Impound'ing a Doc'ument is the phrase used in law to denote that a judge has retained a document produced at a trial, instead of returning it to its owner. The object of this act is to enable a prosecution to be legally effected.

Impounding Cattle, in English law, denotes the right of an occupant of land to seize cattle found straying on such land, and to drive them to the nearest 'pound' (Ger. *pfand*) or 'pledge-place,' if it be within three miles; if not, he may keep them on his own premises, but must take proper care of them. The owner can only recover them by paying the expenses of their keep. In Scotland the phrase used is 'poinding.'

Impress'ment of Seamen was for long the means used to man the British navy. The lawfulness of the procedure appears to rest mainly on national necessity, no statute having declared the power to belong to the crown; though there are statutes which imply that it does. The implication chiefly arises from the statutory declaration of special exemptions. According to Lord Kenyon, the right of impressment is founded on common law, and extends over all seafaring persons. An endeavour has been made to lessen the necessity of naval impressments by a system of registration of merchant seamen, and by encouraging the voluntary enlistment of seamen into the royal navy.

Impris'onment. The Act 32 and 33 Vict. c. 62 abolishes I. for nonpayment of debt, unless for default of payment of certain penalties. The Act, however, gives power to a judge to arrest a debtor to the amount of £50, when it is proved that the debtor is about to quit England. Provision is also made for the punishment of fraudulent debtors. The frauds specified consist generally of false representations regarding property, collusive transfers of it, and other practices for the misleading and deception of creditors. Fraudulently obtaining credit renders the offender liable to a year's imprisonment with hard labour. In Scotland, I. for debt has not yet been abolished, and may be enforced by a creditor against a debtor to the amount of £8, 6s. 8d. See BANKRUPTCY, for Eng. and Scot. law; especially Scotch, see CESSIO BONORUM. For criminal I., see COMMITMENT FOR TRIAL, BAIL.

Improba'tion, a term of Scotch law denoting the disproving and setting aside of writs *ex facie* probative, on the ground of falsehood or forgery.

Impropria'tion and **Appropria'tion**, terms used to denote the transfer of ecclesiastical property or revenue from the benefice to the use of a layman or of a bishop or spiritual corporation. On the dissolution of religious houses in the reign of Henry VIII., a statute was passed giving the property which had belonged to them to the king. Grants by the crown from this source are called *impropriations*, because, according to Spelman, they are diverted from their proper use. A benefice held by a bishop or religious corporation is an *appropriation*; when held by a layman it is an *impropriation*.

Improvisato're and **Improvisatrice** are the names given in Italy to men and women who have the curious gift of composing offhand and reciting verses to almost any extent on almost any subject, but especially on political subjects. The art there is an old one, Brother Philip in the time of Sixtus V. having been a great I. In this century Gianni of Genoa and the Ricci of Florence are the most prominent figures. The siege of Rome in 1847 produced some fine improvisatori. There is generally an accompaniment on the guitar. The Italian language is very favourable to this composition, which is also in keeping with the melodious, impetuous character of the inhabitants. But improvisatori are quite an institution of savage life. Thus, among the Mandingo negroes there is a class of *singing men*, who extemporise in honour of the chief or any one else who will pay them, and who also recite historical events. The Zulu royal heralds are remarkable for their impromptu volubility and total disregard of pauses. In Abyssinia the improvisatori, who are generally through Africa recognised as a distinct profession, like the troubadours and minstrels, attend funerals and chant the praises of the dead.

Impul'sive Insan'ity is not a distinct form of mental disease, but has reference, principally, to the sudden accession of symptoms of a peculiar class. In general, there are well-marked premonitory symptoms prior to the full development of mental disease; but it occasionally happens that the symptoms are obscure, and, in some cases, quite imperceptible. Sudden outbreaks of acute mania, or the sudden lapsing into a state of dementia, are not illustrations of I. I., for such are associated with great disturbance of the nervous centres, indicated by general incoherence and delusions. I. I. is, strictly speaking, the sudden development of a Monomania (q. v.) in which a propensity is involved, the more marked illustrations being cases of homicidal and suicidal mania, pyromania, kleptomania, dipsomania, nymphomania, and satyriasis.

Imputa'tion, in theological language, means attributing anything to a person or persons as the meritorious reason of reward or punishment, that is, of the bestowal of good or the infliction of evil. So far as the meaning of the word is concerned, it makes no difference whether the thing imputed be sin or righteousness, and therefore the same thing is meant whether the I. of Adam's sin to us, of our sins to Christ, or of Christ's righteousness to believers, be referred to. 1. The I. of Adam's sin to his posterity seems to be implied in the Pauline theology, and has certainly been a doctrine of the Church since the time of Augustine, who laid down the proposition that 'as all men have sinned in Adam, they are justly exposed to the vengeance of God because of this hereditary sin and guilt of sin.' A subject of controversy at the time of the Reformation, as it had been all along, was the relation of this I. to hereditary corruption of nature. (See ORIGINAL SIN.) And in the 17th c. an attempt was made to distinguish between 'mediate' and 'immediate' I. La Place of Saumur advanced the theory that there is no direct or immediate I. of Adam's sin to his posterity, but an indirect or mediate I. of it, founded on the fact that we derive a corrupt nature from him. In opposition to this theory the Formula Consensus Helvetici stated the full and distinct Calvinistic doctrine on the subject, namely, that 'it does not appear how hereditary corruption, as spiritual death, could fall upon the entire human race by the just judgment of God, unless some fault, . . . bringing in the penalty of that death, had preceded. . . . Wherefore man, previous to the commission of any single or actual transgression, is exposed to the divine wrath and curse from his very birth, . . . first, on account of the transgression and disobedience which he committed in the loins of Adam; and, secondly,' &c. 2. Regarding the I. of our sins to Christ, Calvinistic divines explain that it is not thereby meant 'that he was morally criminal on account of them, or that the demerit of them rested upon him, but that he undertook to answer the demands of justice for the sins of men.' 3. So the I. of the righteousness of Christ to believers is explained to mean 'not that the merit of his righteousness is their personal merit, nor that it constitutes their moral character, but that the righteousness of Christ having been wrought out for the benefit of his people, in their name, by him as their representative, it is laid to their account, so that God can be just in justifying the ungodly.' See Hodge's *Systematic Theology* (Edinb. 1873).

Inaja' Palm. The I. P. of the Brazilians—the 'Cocurito' of Humboldt's writings—is the *Maximiliana regia* of botanists, a magnificent palm forming one of the most conspicuous ornaments of the primitive forests of the Amazon region. It frequently reaches 100 feet in height, bearing a crown of gigantic pinnate leaves 30 to 40 feet long. The woody boatlike spathes remain on the trunk for years after flower and fruit have fallen. They are used by the Indians for baskets, cradles, and cooking utensils.

Inarch'ing, or **Graft'ing by Approach**, differs from ordinary Grafting (q. v.) in the scion being attached to the parent tree during the process of union, and only separated from it when that union is accomplished. It is necessary, therefore, that the plants operated upon be placed near each other so that their branches may overwrap. The position of the intended junction being selected, a piece of bark is removed from both scion and stock, the parts are fitted together so that their cambium layers may coincide, and the process of tying and protecting follows as in common grafting. After union the scion is severed, and may subsequently be cut off close to its new stock. I. is well adapted for the young shoots of oranges, camellias, &c. It effects the same results as grafting.

In Artic'ulo Mor'tis, a phrase used in Scotch law to denote the execution of a deed on *Deathbed* (q. v.).

Incanta'tion (Lat. *incantatio*, 'an enchanting,' from *in* and *canto*, 'I sing or chant') is a form of passionate, generally rhythmical, speech, which is supposed to have a *controlling effect* over gods or demons, or even natural forces. It is therefore the opposite of prayer or supplication. Theoretically it can hardly be discussed apart from the other rituals by which Shamanism or religious magic deludes its followers. The Shaman is generally able to throw himself into a nervous excitement, his mouth foaming, his limbs convulsed. He selects as apprentices epileptic persons. The negroes prefer dwarfs and albinos. The Siberian priest, the N. American medicine-man, the S. American *playe*, with their drums, horns, or *maracca* (a rattle consisting of a hollow gourd filled with hard seeds), all profess by the production of certain sounds to remove illness or bad weather, or plagues of any kind. The shell-trumpet of Papua is a similar case. The same principle also appears in some forms of sacrifice and other symbolical acts, and even in the revolving prayer-wheels of the Buddhists. So also with the devil-dancers of the wild Veddahs. Clad in green leaves, they shuffle round an offering of eatables placed on a tripod, and gradually work themselves with moans and screams into a paroxysm, and thus extort the secret of curing disease. The Tasmanian doctors use a rattle of dead men's bones. Among the Dyaks, if conversation does not compel the spirit, gongs are used by the medical profession. The Bechuana prophets leap and shout in a peculiar manner, or strike the ground with a club; and many of the African fetish-men practise ventriloquism so as to obtain an audible answer to their I. The holy fetish jargon is unintelligible to the rest of the tribe. The Kaffir handling-doctors dance, drum, put mysterious questions, and receive answers. The Bushmen cry out a set form of furious words against the thunder. Among the Todas of N. India the priest pronounces an I. over every bell-cow added to the herd. The *ohja*, or exorcist of the Bodo tribe, sits before thirteen leaves sprinkled with rice, swinging a pendulum and muttering rapidly. This compels one god of the thirteen to confess what he has been doing. Among the Kamchatdales the old women avert disease by whispering on the fins of fishes and on blades of sweet grass. The Mishmi priest drives evil from the house by a monotonous chant, flourishing a fan in one hand and rattling a box of pebbles in the other. The *modus operandi* of I. is not clear. Among very savage people mere loudness, harshness, or shrillness is thought important; it terrifies the gods. But generally the force of alliteration and rhythm, rhyme and cadence, is resorted to in order to express the intensity of feeling; and much of the impressive effect depends not only on the accessories, but on the principle of repetition. Long after the decay of explicit belief in particular supernatural agencies, there survives a confused belief in I. as a mere form of words. So far as the cure or other benefit depended on faith, on the impression made on the mind of the patient, it may still be obtained.

Incarna'tion (from Lat. *in*, and *caro*, *carnis*, 'flesh') is the theological term for the doctrine that the second person of the Trinity, the divine Logos, was united with the person of Jesus (q. v.), the son of the Virgin Mary (John i. 14). The mere conception of an I. is not peculiar to Christianity. Krishna was an I. of the second person of the Indian trinity, born of a virgin of a royal line (Jones' *Asiatic Researches*); and the Buddhas (see BUDDHISM) were either men exalted to the Buddhaship, or an I. of Vishnu or of Brahma. Again, all the forms of Sun-worship (q. v.), in Egypt, Persia, Phœnicia, Greece, &c., had their I. in the person of Osiris, Mithra, Adonis or Thammuz, Atys, Dionysus or Bacchus, &c.

In'cas, or **Yncas** (a Peruvian word signifying 'chiefs'), the name given in Peru before the Spanish conquest to the sovereign and princes of the blood. See PERU.

In'cense (Lat. *incensum*, 'what is set on fire,' from *incendo*, 'I put fire to') is a compound of several sweet spices, the burning of which, so as to raise a smoke and fragrant smell, formed a part of the religious rites of most ancient nations. Among others, it was used by the Israelites, both in their idolatrous worship (Jer. xi. 12), and in connection with their sacrifices to Jehovah (Exod. xxx. 34-38). The proper compound was equal parts of stacte, onycha, galbanum, and Frankincense (q. v.), and so much salt (Exod. xxx. 35, 'tempered'), which, as the symbol of incorruptibility, was present in all offerings (Lev. ii. 13). In the Christian Church there is no trace of I. as a part of worship proper during the first four centuries. It was early used, however, in the caves and catacombs in which the first Christians often worshipped as a disinfectant and to counteract offensive smells, and in the 5th c. or 6th c. it began to be used as a part of the worship. The use of I. being regarded by Protestants as an idolatrous practice, was one of the things rejected by them at the Reformation.

Incensed', or **An'imé**, a heraldic epithet applied to wild animals having fire issuing from their ears and mouth.

In'cest (Lat. *in*, 'not,' and *castus*, 'chaste') is the simulated marriage or the sexual intercourse of persons legally forbidden to intermarry on account of relationship or of Affinity (q. v.). The offence was at one time capital in England. It is now cognisable only by the ecclesiastical courts. In Scotland I. still renders the offender liable to the punishment of death. It is not probable, however, that the extreme penalty would be inflicted.

Inch, Inis, Innis, Inish, Ennis, variants of the same Gaelic word, denoting primarily the islands formed by the branching or encircling of rivers, of which the 'Inches' of Perth are still examples. *Inch* is the prevalent form in Scotland, *Inis* in Ireland; but both occur in each of these countries. The words were afterwards applied to islets in the sea or in lakes, *e.g.*, Inchkeith, Inchcolm, in Scotland; Inisturk, Inishmore, Inishmann, in Ireland.

Inch, in British linear measure, is the twelfth part of a foot, or the thirty-sixth part of the imperial standard Yard (q. v.).

Inch'bald, Elizabeth, *née* **Simpson**, an English actress, dramatist, and novelist, born of Roman Catholic parents at Stanningfield, Suffolk, 15th October 1753, came to London at the age of sixteen to seek a theatrical engagement. From the dangers and temptations to which her youth and beauty exposed her she was only freed by her marriage in 1772 with Mr. I., an actor to whom she had applied for counsel and protection. The same year she made her début at Bristol, acted subsequently with her husband at Edinburgh, Glasgow, York, &c., and made a short tour in France. Mr. I. dying at Leeds in 1779, she contracted an engagement at Covent Garden, London (1780-89), and during this period produced a farce, *The Mogul Tale*, and other pieces, the success of which led her finally to quit the stage and apply herself wholly to literature. Mrs. I. died at Kensington, 1st August 1821. She published in all ten plays, three collections of plays, and two novels; but of these, the last—*A Simple Story* (1791) and *Nature and Art* (1796)—are the works by which she is now remembered, and have indeed taken their place among the standard novels of the language. Her Memoirs were published by J. Boaden (2 vols. 1833), but an autobiography, for which Phillips the publisher had offered £1000, she destroyed by the advice of her director.

Inchcolm' ('St. Colm's Inch'), an islet, about one mile long, in the Firth of Forth, 5 miles N.W. of Leith, and included in the parish of Aberdour, in Fifeshire. It is separated from the Fife shore by 'Mortimer's Deep,' which has a breadth of one mile. It was anciently called Acmona, is said to have been the residence of St. Colm or Columba while attempting the conversion of the Picts, and was the site of an abbey of Austin canons founded by King Alexander I. in 1123, and of which there are interesting remains, including a fine stone-roofed oratory and a beautiful chapter-house. Walter Bower, the continuator of Fordun's *Scoti-Chronicon*, was abbot from 1418 till 1449. A detailed history of I. appears in the *Proceedings of the Society of Antiquaries of Scotland* (vol. ii. pp. 489-528).

Inchkeith', an island in the Firth of Forth, included in the county of Fife, Scotland, 2½ miles N. of Leith. It is about half a mile long, and has a rocky surface that rises to a height of 180 feet at the N. end, where there is a lighthouse with a revolving light visible for 18 miles. It is supposed to be the *Caer Giudi* of Bede, and the site of a monastery founded by St. Adamnan, the biographer of St. Columba, between 679 and 704. It was seized and fortified by the English in 1547, recovered by the French auxiliaries in 1549, and dismantled in 1567. It was early the property of the Keith family, reverted to the crown, and subsequently became the property of the Buccleuchs.

In'cidence, Angle of, is the angle at which a ray of light or radiant heat falls upon a surface. See LIGHT, OPTICS.

In'cident Dil'igence, a term of Scotch law applied to a process to compel the attendance of witnesses and havers. In England, the same end is obtained by writ of *Duces Tecum* (q. v.). See also DILIGENCE.

Inclined' Plane, a simple form of machine, by means of which a man may raise to a given height a heavy body which he cannot lift. It is merely a plane inclined to the horizontal at an angle other than 90°. If a body of weight W, be drawn up an I. P. of length l to a height h, the whole amount of work done is evidently (neglecting friction) equal to the work which must be done to raise W to the height h, and is therefore represented by the product Wh. (See ENERGY.) The same work may, however, be estimated as the product of the force (F) which has to be exerted to draw up the weight into the distance through which it acts, *i.e.*, may be written $F \times l$. Hence $F = W\frac{h}{l}$; so that the ratio of the weight to the power which can support it is as the length of the plane to its height. In practical questions, Friction (q. v.) must be taken into account, and it always acts in a direction contrary to that in which the body tends to move.

In Cœ'na Dom'ini, or **Pastora'lis,** is the name of a Papal bull, which has been traced back to Gregory XI. (A.D. 1370), and which was regularly published at Rome every Holy Thursday down at least to 1773. It relates to discipline, and recognition has been denied to it by almost every country in Europe. Its rejection is made the subject of Article XVII. of the famous Declaration of the liberties of the Gallican Church. The bull anathematises heretics and their abettors, those who read or print their books, schismatics, all persons and universities who appeal to a future council, pirates and wreckers, those who impose or augment tolls without leave of the Pope, those who supply the Saracen or Turk, or other enemies of Christ, with arms or aid, those who prevent persons coming to Rome, or stop supplies, those who appeal to secular power against the execution of the letter apostolic, secular judges who bring ecclesiastical persons before their tribunals, and those who exact contributions from such persons. It was the attempt of Clement XIII., in 1768, to enforce the bull in Parma, that led to a strong expression of opinion against it by several European powers, and ultimately to the triumph of the *Regalisti* party at Rome, and the suppression of the Jesuits. The English Roman Catholics hold the bull to be obsolete. See *Lord Arundel's Letter to Mr. Plumptre*, (Lond. 1848), and various pamphlets published in the same year by Hatchard.

Incombus'tible Fab'rics are made of the fibrous mineral *asbestos* (Gr. 'unconsumable'), which remains uninjured in the intensest heat. The ancients wrapped the dead in tissues of that material to preserve their ashes after cremation. Ordinary textile fabrics are protected from the effects of fire by steeping them in saline solutions. See FIREPROOFING.

Income-Tax is a tax originally imposed by Sir Robert Peel in 1842 on all incomes in Great Britain above £150 a year. By 16 and 17 Vict. c. 34 the tax was extended to Ireland. Its range has been from 2d. to 1s. 4d. per pound.

Incommen'surable, in mathematics, is a term used with reference to two quantities which have not a common measure, or, in other words, which are not multiples of any one unit, however small that unit may be taken. Such a pair is the side of a square and its diagonal, the area of a circle and that of the circumscribed square, the quantities $\sqrt{2}$ and $\sqrt{3}$, and so on.

Incorpora'tion. See CORPORATION.

Incuba'tion, a name applied to the habit practised by many birds and by some reptiles of sitting on their eggs, and thus favouring the development of the young by the heat of the parent body. The period occupied in the process varies greatly. The humming-birds and many other smaller birds generally incubate for ten or twelve days, canaries from fifteen to eighteen days, whilst the duck and turkey sit for a month, and the common hen three weeks. The swan incubates for the long period of forty or forty-five days. The duration of the incubatory period varies according to the external temperature, being slightly extended if the weather be cold. Artificial I. has been practised with success in France and elsewhere, various machines having been invented with a view to surrounding the eggs by the proper degree of temperature during the sitting period. See *Ure's Dictionary of Arts and Sciences*, vol. ii. p. 496 (5th ed. 1860).

Incubation of Diseases, or the period of latency, designates the interval that elapses between the time when the infective matter is received into the system, until the first symptoms of the disease become manifest, or the interval before the infection received can be again communicated. The period of I. of D. of the zymotic type varies, it being much longer in some diseases than in others, as in cholera, which may be fully expressed in a day, and in hydrophobia, which may not be developed for several months. In each disease, also, the constant quantity of the period of incubation varies according to the constitution of the person affected, the amount and intensity of the contagium, and the mode by which it is conveyed into the system. In some constitutions the contagium germinates and multiplies more rapidly than in others, and there seems to be a considerable variety as regards virulence of type, by which the constitution is more or less rapidly and severely impressed. Specific contagium affects the system most rapidly when injected into a vein or a visceral serous-cavity, but less so by means of inoculation or contact with an open sore. As a general rule, contagium acts more rapidly and certainly when introduced by inhalation than by ingestion. The disease germs may be intercepted in the air-passages, or destroyed by the juices of the stomach, or the condition of the blood may be such as to neutralise their development. The period of I. of D. is most certainly ascertained by means of inoculation, and it has been demonstrated that some diseases cannot show themselves except after a certain interval, and that this interval is definite within certain limits. As a general rule, when the period of incubation is long, the period of infection is short, and *vice versa*. During the I. of D. the specific germs evidently undergo a process of development and increase, after the same fashion as the germs of plants and the ova of animals, each specific disease germ having its own definite period. In each particular case the period of I. of D. is marked by its own peculiar symptoms; but such are not so clearly defined as the symptoms characteristic of the period of invasion, nor of those marking the period of full development.

Incum'bent is the holder of an ecclesiastical benefice in England or Ireland. The term is not technical in Scotland in civil or ecclesiastical law.

Incumbered Estates Court. See LANDED ESTATES COURT.

Incum'brances, a general term for pecuniary burdens on land.

Incunab'ula (Lat. lit. 'swaddling clothes;' hence 'beginnings') is the name given to the early printed works which immediately succeeded the image or block books, and which are all dated prior to 1500. There are probably at least 18,000 I., chiefly from the presses of Mainz, Bamberg, Cologne, Strassburg, Rome, and Venice. In the very early specimens, no printer's name, date, or place of printing, title-page, or titles to chapters, appear. Catchwords and signatures for the direction of the binder took the place of the older *register*. (an alphabetical list of the first words of chapters), and preceded the numbering of pages. The primitive Gothic or black-letter types soon gave place to Roman, and in 1501 Aldus introduced *italics*. In Caxton's books commas and periods are represented by oblique strokes. Blanks were often left for illuminated capital letters. Coloured frontispieces were also frequent, a common subject being the author at his desk. Except by the great Parisian and Venetian printers of the time, devices, *vignettes*, or ciphers were not used to mark the particular press. Herbert, Ames, and Dibdin are the chief writers on English I., the best collections of which were in the Lambeth and Althorp libraries. The most important general authorities are Laire's *Index* (1791); Serna Santander's *Dictionary* (1805); Maittaire's *Annals* (1719), on which was founded Panzer's *Annals*, 10 vols. (1793-1803),

Hain's *Repertorium Bibliographicum*, 4 vols. (1826-38), which mentions 16,299 books.

In'cus, one of the small bones in the middle ear. Shaped somewhat like an anvil or bicuspid tooth, it unites on the one side with the *malleus*, or mallet (which is connected with the membrane of the drum), and on the other with the *stapes* or stirrup, which fits into the oval window of the internal ear. It is thus the middle link in the chain of bones, and it transmits the vibrations of the *membrana tympani*, or drum of the ear, to the internal ear. See EAR.

Inde'cent Exhibi'tions, or **Expo'sure**, or **Prac'tices**, are offences of various kinds punishable by statute in England, and in Scotland by common law.

Indefectibil'ity of the Church includes its Perpetuity, by which it is free from failure of its members, and its Inerrancy and Infallibility, by which it is free from failure in holding and declaring the truth. For the perpetuity of the Church such passages of Scripture are cited as Isa. lxi. 9; Dan. ii. 44; Matt. xvi. 18, xxviii. 20; John xiv. 16, 17, and the following arguments adduced: that 'the consummation of all things is delayed only till the servants of God are sealed' (1 Cor. xv. 28; Rev. vi. 9-11), so that when faith fails the end will be (Luke xviii. 8), and that as God will have all men to be saved, and come to the knowledge of the truth, the Church could not fail without a failure of God's mercy. See INFALLIBILITY.

Indem'nity Deed is in English law a deed in security of the fulfilment of an obligation. The similar deed in Scotland is called a *bond of relief*.

Inden'ted, one of the partition lines of a heraldic shield, serrated like *Dancetté* (q. v.), but with smaller notches.

Inden'ture. Formerly it was held in England that there ought to be as many copies of a deed as there were parties to it, and that each copy should be notched at the margin so as to correspond with the others—hence the name of I. See DEED.

Indepen'dents are a sect of Christians whose history properly dates from the Commonwealth, although, like every other Christian sect, they hold that theirs is the genuine primitive form of church government. The sect was founded by John Robinson, a Brownist minister at Leyden, about 1610, and in 1616 Mr. Jacob, who had adopted the sentiments of Robinson, established the first Independent congregation in England. Owing to the persecution of Nonconformists at the time, they did not dare to show themselves openly in the country till 1640. In the Westminster Assembly five of the divines belonged to the I., but they were completely overpowered by the Presbyterians. They were afterwards favoured by Cromwell, however, and in consequence increased greatly in numbers and influence. In 1658, being now a numerous and wealthy body, and having obtained the consent of the Protector, they convened a synod, and drew up a 'Declaration of the Faith and Order owned and practised in the Congregational Churches in England.' This Declaration was virtually a republication of the Westminster Confession, with the omission of those passages which maintained the Presbyterian discipline, and with the addition of a chapter in which the Independent scheme is asserted and explained. At the Restoration (1660) the I. lost all their political importance. They suffered much also from the Act of Uniformity (1662), the Conventicle Act (1664), and the Five-Mile Act (1665). Their sufferings had been increased also by a want of agreement with the Presbyterians, but in 1691 the two bodies came to a partial agreement, which was ratified (and made to include the Baptists) in 1696, and again about 1730. From the close of the reign of Queen Anne (1714), while Presbyterianism gradually declined in England, the I. rallied, until they now stand at the head of the Protestant Dissenters in England, if not in mere numbers, at least in political energy and intellectual culture.

The name of I. was assumed by the sect in their Apology published in 1644, but finding afterwards that it was also adopted by other sects and parties with whose tenets they had no sympathy, they discarded it, and adopted instead the name of Congregational Brethren. This name is derived from a point in their church government, the circumstance, namely, that whereas in the Presbyterian Church the government of each congregation is vested in a session composed of the pastor and ruling-elders, in the Congregational Church it is vested in all the members of the congregation. They also differ from the Presbyterians in holding that each congregation is entirely exempt from any extraneous jurisdiction, a tenet from which was derived their original name of I. The following are the principal items of statistical information regarding the Congregationalists in Great Britain and the Colonies (1877):—There are in England and Wales 2862 churches, with 2496 ministers; in Scotland, 109 churches, with 120 ministers; in Ireland, 28 churches, with 26 ministers; in the smaller British Islands, 18 churches, with 8 ministers; in the Colonies, 329 churches, with 301 ministers, besides 148 missionaries of the London Missionary Society, and 98 native ordained missionaries connected with the denomination. Of colleges and institutes for ministerial training there are in England and Wales 13, with 40 professors and 392 students; in Scotland, 1, with 3 professors and 9 students; in the Colonies, 3, with 9 professors and 29 students. See Vaughan's *Congregationalism* (Lond. 1842); Dexter's *Congregationalism* (Boston, U.S., 1868); *Congregational Year Book*.

Indeter'minate, in algebra, is a term applied to a class of problems which have an infinite number of solutions. An equation which involves two unknown quantities is in general indeterminate, for it requires *two* simultaneous equations to fully determine two independent variables. As a simple example of an I. problem the following may be given:—Find two numbers such that, if twice the one be subtracted from three times the other, the difference is unity. This is satisfied by the numbers 1 and 1, 3 and 4, 5 and 7, 7 and 10, and so on; and has therefore an infinite number of rational solutions.

In'dex (Expurgato'rius) is the catalogue or table of books the reading of which is forbidden by the Congregation of the Holy Office, according to instructions originally issued by Paul IV., under pain of excommunication and perpetual infamy. The first considerable edition was by a committee of the Council of Trent. The names of the books and of the authors, and a separate list of anonymous books, are given. To publish, print, or to have in one's possession, is as wicked as to read. 'Prava doctrina' is the form of objection. The authority of the I. does not depend on the dogma of Infallibility, but on the Catholic duty of obedience. Every bishop can forbid the use of a book in his diocese. The authority is not fully admitted in all Catholic countries, though in most great deference is paid to it as a warning or advice. Decrees are sometimes issued against booksellers, forbidding them to sell or contract for a certain book, and directing their shops to be closed. A book is sometimes damned '*donec corrigatur*,' and then it is the duty of those concerned to submit proposed corrections to the Congregation. In passing laws against heretics, the Church, or the Catholic state, has always made special provision for the destruction of their books. Thus Innocent II. dealt with the books of Abelard, and the Council of Constance with those of Wiclif and Huss. In fact, that a book is by a heretic is sufficient, though it contain no heretical matter. The old rule of the Council of Trent damning all anonymous books is now relaxed. Thus all Protestant literature on the one hand, and such heretical works as Fénélon's *Explanation of the Maxims* and Dupin's *Ecclesiastical Law*, are forbidden. A convenient reprint with preface by Mr. Gibbings was published at Dublin in 1837.

In'dia is the geographical term properly applied to the central peninsula of Southern Asia, which is bounded on its landward base by the Himalaya Mountains and the rivers Indus and Brahmaputra. The name was originally brought into use by the Greeks, having been formed from the Sanskrit 'Sindh,' 'the land of the Indus,' which in its Persian form became Hindustan (q. v.). In this article, however, the word India will be understood in its modern political signification, as comprehending the entire region over which Queen Victoria exercises supremacy as Empress of I. Since the proclamation of that title, dated 28th April 1876, it is no longer necessary to maintain the former distinction between British and Native I. The old geographical heading of Further I. for the peninsula to the E., comprising Burmah, Siam, &c., may also be suffered to become obsolete.

I., then, in the modern political sense, excludes Ceylon, as also the Straits Settlements of Singapore, &c., but includes the Punjaub and British Burmah, as well as the small islands in the Bay of Bengal and the Indian Ocean. The outlying station of Aden, at the

S.W. corner of Arabia, though administered from I., must be omitted owing to its geographical remoteness. I. forms an irregularly-shaped tract, with few natural boundaries except the sea. It extends from Cashmere in the N. to Cape Comorin in the S.; and from the mouths of the Indus in the W. to beyond the mouths of the Irawaddy in the E., about 19,000 miles each way. On the N. are Chinese Tartary or Yarkund, Thibet, Nepaul, and Bhootan, the two first of which lie beyond the Himalayas, the two latter within their southern ranges; on the N.E. are the unexplored hills which cut off British territory from Burmah and China; on the N.W., Afghanistan and Beluchistan are separated by the Suleiman and Hala Mountains; in all other directions there is open seaboard.

The following table, taken from the 'Statistical Abstract relating to British I.' (1874), shows in detail the area and population of each British province, according to actual census taken between 1867 and 1872, together with estimates for the aggregates of the feudatory states and foreign possessions, some of which enumerations are fairly accurate and others merely conjectural:—

AREA and POPULATION of BRITISH INDIA, with estimate for the Native States and Foreign Possessions.

Provinces.	Under British Administration.		Native States.		Total.	
	Area in sq. miles.	Population.	Area in sq. miles.	Population.	Area in sq. miles.	Population.

The *Physical Aspect* is extremely varied, and represents the grandeur of tropical phenomena on a most impressive scale. The Himalaya Mountains exhibit both the loftiest peaks and the highest level of elevation in the world; their southern slopes drop abruptly on the wide plain of Hindustan Proper, where they are fringed by the *terai* jungle, fatal to Europeans during most seasons of the year. To the S. of this plain, again, lies the mountain plateau of the Deccan, which is bounded on the N. by the Vindhya Hills, and extends between the Eastern and Western Ghauts almost to the southern point of the peninsula. From these several ranges, which catch the entire rainfall brought up from the sea by the monsoons, issue innumerable torrents, which finally form a few great rivers, and annually inundate the low-lying lands for miles on each side. The total area that drains eastward into the Bay of Bengal is about 1,442,000 sq. miles; while the drainage of about 630,000 sq. miles flows westward into the Indian Ocean. The delta formed by the confluence of the Ganges and the Brahmaputra, which two rivers alone have a basin of over 750,000 sq. miles, is perhaps the most fertile spot in the world; while the embouchures of the Irawaddy, the Mahanuddy, the Godavery and the Kistna are hardly less so. The Indus, on the other hand, which is in length the first river of the country, winds through a desert and rainless tract, and neither brings down natural fertility nor gives birth to commerce. S. of the junction of the Sutlej with this river lies the Thur Desert, a sandy and almost uninhabited region, covering 68,000 sq. miles.

The *Geology* of I. has been the study of a special department for the last quarter of a century. On the whole, but few extraordinary features of scientific or commercial interest have been disclosed. The great mountains are mostly composed of metamorphic rocks, which protrude through later formations of sandstone and conglomerate. Limestone, in the form of laterite and *kankar*, is common in the neighbourhood of the alluvial river basins. The mineral wealth of India consists of coal, iron, and salt. Gold is washed by wild tribes in many hill torrents, but not remuneratively. Copper is mined in several places in the Himalayas. Very rich tin deposits are known to exist in the S. of British Burmah. Antimony abounds in the Himalayas; and cobalt and alum are found in Rajputana. Saltpetre effloresces from the soil in Behar, but the manufacture has fallen off. The chief coal-fields lie between the valleys of the Ganges and the Godavery, but isolated deposits are found in many parts of the country. The geological formation which yields nearly all the coal is known as the Damuda; it is the same as that of the Australian beds, and differs but slightly from the carboniferous strata of Europe. The total area of the coal measures is computed at 35,000 sq. miles. In Raniganj there are forty-four coal-mines at work; and now (1877) the East Indian Railway is entirely supplied from its own collieries at Kurhurbari. Iron in various forms is scattered throughout India, and has always been wrought by native methods. Hitherto it has failed to attract English capital. The great Salt Range in the N. of the Punjaub is said to be the most valuable deposit of the substance known to exist, and the yield is increasing year by year. Much salt is also obtained in the dry season from the lakes in Rajputana, and by solar evaporation along the coasts of Madras and Bombay.

The *Climate* of India is thoroughly tropical, except in the more favoured hill stations. The year naturally divides into three seasons—the rains, from June to October; the cold weather, from November to February; and the hot weather, from February to June. There are, of course, local variations, but the periodicity of the Monsoons (q. v.) determines the regular sequence. The extreme hot weather, accompanied by sandy winds in some parts of India, and by a steamy dampness in Bengal, is most feared by Europeans, though it has been ascertained to be the least unhealthy season for the natives. The mean temperature of Calcutta is 79° F.; the highest recorded, 106°; the lowest, 53°, giving a mean range of 53°. The mean temperature of Madras and Bombay is somewhat higher, and that of Delhi considerably lower. The chief meteorological interest of I. centres upon the rainfall, upon which depends the success of the harvests. The amount of rain that falls in different tracts varies excessively. In the N.W. corner of I., composing half the Punjaub and all Scinde, less than 15 inches falls in the year, and irrigation is an absolute necessity; whereas at Cherra Pûnji in the Assam Hills as much as 805 inches have been registered (366 in the single month of January 1861). For the proper cultivation of rice, an annual fall of 72 inches is said to

be necessary; but it is required, above all, that this amount should be distributed through the proper seasons. The Bay of Bengal is the home where originate the tremendous cyclones which occasionally devastate the E. coast of I., especially the neighbourhood of Calcutta. The calamity of October 1876 is said to have swept away in one night 250,000 souls at the estuary of the Brahmaputra.

Vegetable Productions.—The extraordinary fertility of many parts of I. has passed into a proverb. The bountiful rice and the useful cocoa-nut palm have found a place in the Hindu religion. But it is a mistake to suppose that rice is the universal food of the people. It is only in the swamps of Bengal Proper, Orissa, Burmah, and the coast of Madras that its cultivation largely predominates; and even there, health requires that pulses, &c., should be consumed with it. Throughout the rest of I., various sorts of millets, barley, wheat, gram, and maize, form the staple food-grains, though rice is always preferred by those who can obtain it. Opium, cotton, jute, and indigo, the four great crops for exportation, are all very local in their production. Opium is confined to the mid valley of the Ganges and to Malwa; the best cotton comes from the Central Provinces and the south of Bombay; jute is grown nowhere but in E. Bengal, and indigo chiefly in Behar. Sugar is widely manufactured both from the sugar-cane and the date-palm; but, as with tobacco, little is produced beyond what is required for local consumption. Oilseeds of many kinds are grown as cold-weather crops. Fruit-trees, vegetables, and spices of all sorts abound. In the river basins the productiveness of the soil is so great that three crops are sometimes raised from the same field, on which no manure is put, and which is never allowed to lie fallow. The modes of agriculture, though primitive, are exceedingly laborious, and the principles which underly the rotation of crops are not unknown. The products raised under European supervision, excluding indigo, are coffee and tea, both of which are grown in the hills, on virgin soil cleared of jungle. Coffee is grown in Mysore and Coorg; the exports in 1875 were valued at £1,308,000. Tea is chiefly grown in Assam, Darjeeling, and Chittagong; the exports in 1875 were £1,963,000, which shows a steady annual increase. Cinchona, for the preparation of quinine, has been successfully introduced into these same hills; and experiments are now being made with ipecacuanha. A special department for the care of the forests was first organised in Bombay in 1846; and now a carefully trained staff is annually sent out from England. The forest reserves cover more than 6,000,000 acres, the revenue from which considerably exceeds the expenditure. The most valuable forests are on the lower hill ranges; among the timber trees are teak, *sal*, deodara, sandalwood, blackwood, and ironwood. Caoutchouc is an important product of the N.E. frontier, being brought in from the forests by the wild tribes of Assam and Burmah.

Animals.—Among domestic animals the first place is due to the sacred ox or humped zebu, which is used for ploughing, for draught, and for milk. The finest breeds come from Gujerat and Hurrianah; the cattle of Bengal are miserably dwarfed. The buffalo is also largely used for ploughing, and thrives best where the oxen are worst. The horses are not good; even the breeds of the Deccan and Kattywar have degenerated, and it has become difficult to obtain remounts for the cavalry except by importation. Elephants are mainly kept for ostentation; the chief supply now comes from the N. and N.E. frontier. Throughout Bengal and Assam about 250 are captured annually. The finest goats are bred in the neighbourhood of Patna, sheep in the Punjaub and N.W. Provinces. Pigs are only eaten by low castes. The tiger is still common in many parts; like all other wild animals, he is only driven back by the advance of cultivation. His ravages are not so much dreaded by the villagers as are those of the wild hog and deer, whose numbers he keeps down. It is only the confirmed man-eater that they fear, who, on his part, generally avoids Europeans. Other common beasts of prey are leopards, wolves, hyenas, bears, jackals, and wild dogs. The largest game are the elephant, rhinoceros, and bison. The lion is said to be found in a few special tracts. Fixed rewards are given by Government for the heads of certain wild animals; but poisonous snakes annually destroy far more lives than do tigers, their victims being estimated at as many as 20,000 a year. In times of inundation, the snakes take refuge in the raised villages.

People.—The average density of the population in British I. is 211 persons to the square mile, varying from 468 in the province of Oude to 31 in British Burmah. In Great Britain and Ireland the average pop. per sq. mile is 265. There is a comparative absence of large towns, only 44 containing more than 50,000 inhabitants. Of the total pop. 73½ per cent. are called Hindus, and 21½ per cent. are Mohammedans, leaving 5 per cent. for Buddhists, Christians, Hill Tribes, &c. Nearly all the Buddhists are in British Burmah; those assigned to Bombay are probably Jains (q. v.). The Christians (mostly in Madras and Burmah) number nearly 900,000, of whom about 250,000 have European blood. French missions have been especially successful among the aboriginal tribe of Karens (q. v.). In Scinde the Mohammedans form 78 per cent. of the population; in the Punjaub, 53 per cent.; in Eastern Bengal, 49 per cent.; whereas throughout the entire S. of the peninsula their numbers are singularly insignificant. The term 'Hindu' has been used with great looseness in the several census reports, and has doubtless been applied to many semi-Hinduised aborigines. The total number of Brahmins is over 10,000,000, most numerous in the N.W. Provinces and Oude. The second caste in rank, the Kshattriyas or Rajputs, numbers 5½ millions. The remaining castes it is impossible to discriminate.

The ethnological history of I. yet remains to be written; it would yield very different results from those indicated above. Neither the Hindus nor the Mohammedans form an homogeneous section. Comparatively few of those who are called Hindus can justly lay claim to the august Aryan lineage; and still fewer of the Mohammedans are of Mongolian or even foreign descent. As tested by language, there can be no doubt that almost the entire population of Madras is Dravidian; and tested by colour and physiognomy, the large majority both of the Hindus and Mohammedans of Bengal must also be referred to an aboriginal origin. It is in Hindustan Proper, *i.e.*, in Behar and the N.W. Provinces, and in the Punjaub, that we can alone look for the pure-bred Aryan immigrant, whether under the name of Hindu or Mussulman. The aboriginal tribes, as might be expected, muster strongest in the hilly tracts of Central I., where they have remained almost unchanged since the first advent of a Sanskrit-speaking colony. The Bheels, the Gondhs, the Koles and Mundas, the Sonthals and the Oraons, are the best-known names. Some of them are certainly Dravidian, while others have been connected with the Indo-Chinese races on the N.E. frontier. A negroid origin, however, has been plausibly assigned to many of these tribes.

The Languages and Literature of I. are more specially alluded to in separate articles. The spoken tongues may be divided into four great classes:—(1) Those that are demonstrably derivatives from the Sanskrit of the original Aryan conquerors, such as Hindi, Bengali, Urya, and Gujeratti; (2) those introduced by the later Mohammedan invaders, of which Hindustani (q. v.) is the language of military life, civil administration, and commerce, Persian of diplomacy, and Arabic of religious instruction; to this class may be added Pushtu, used beyond the Indus; (3) the various Dravidian Tongues (q. v.) spoken throughout the S. of the peninsula, and also by some aboriginal tribes in Central I.; (4) a privative group, including the barbarous dialects of the hill races, of which little is yet known. Many of these have Indo-Chinese affinities, and a sub-group may be formed out of the Kolarian tribes of Chota Nagpore. The alphabets used in writing may all be referred to two sources: the Deva-nagari character of the Sanskrit, which has been adopted even by the Dravidians; and the Persian. Sanskrit literature refers itself back to the remotest antiquity. It opens with the Vedas (q. v.), or hymns of ritual and praise, the sacred book of the Brahmins. Then follow the epics, the mythical histories, the commentaries, the codes of law and the dramas, which together constitute a body of original literature second only to that of the Greeks. European influence has not only diffused some knowledge of English among the upper classes, especially in Bengal, but has also directly stimulated the culture of the native languages. Philology has given a new start to the study of Sanskrit, even among the pundits of Benares; while the industry of the missionaries and the needs of our administration have raised not a few of the vernacular dialects to the dignity of printed languages. The native press is gradually establishing itself as a potent instrument for disseminating knowledge.

Religion.—Figures have already been given to show the comparative distribution of the two great creeds of I. It cannot be said that either is at present actively proselytising. A few out-

caste Hindus annually embrace the faith of Islam, and even of late years some of the hill tribes have displayed a tendency to submit themselves *en masse* to the Brahmins. But on the whole, the positions of Hinduism and Mohammedanism remain as firmly fixed as do the limits which separate the Protestants from the Roman Catholics of Europe; and the adherents of the rival faiths live on as good terms as the two Christian sects in Switzerland or Bavaria. Hinduism is described *sub voce.* The Mohammedans of I. have lately taken part in the religious revival that originated among the Wahhâbis of Arabia. In Bengal especially, where they were once scarcely to be distinguished from their Hindu fellow-villagers, they have now reformed themselves in accordance with the traditions of primitive orthodoxy. Speaking generally, they are more litigious and turbulent than Hindus; they are proportionally less numerous among the landlord class, and are less enterprising in commerce. It is as ordinary cultivators and boatmen that they are best known. The vast majority belong to the Suni sect. The various forms of faith professed by the hill tribes are mainly based upon worship of the elements. The sun, mountains, and rivers supply the chief gods. Demon worship is not so common as is often supposed, and human sacrifice was only resorted to on exceptional occasions, even by the Gondhs. But the belief in witchcraft is universally prevalent. Altogether, it seems not improbable that the low opinion commonly entertained of these races is due, not so much to the character of their religion, as to reports spread by the Hindus, who abhor them for their dark colour and their unclean habits of feeding. It is among these primitive people that the Protestant missionaries have, of late years, been most successful. Statistics for 1872 show that there were in that year 318,363 Protestant converts in I. and Ceylon, of whom one half are in Madras. The great majority of Roman Catholic converts are also to be found in the same Presidency, but their number is not increasing. The Brahmo-Somajh (q. v.), or reformed theistic sect of Hindus, founded in 1830 by Rajah Rammohun Roy, counts many firmly established communities, especially in Bengal Proper; and its influence is greater than would be represented by the actual number of its professed adherents. The Parsees, the exiled fire-worshippers from Persia, number 69,000, chiefly in Bombay, where they are well known as the most speculative of merchants. The Jews number only 7600. In Calcutta there is an Armenian colony, of old date and high position. The Sikhs, who are a sect of military enthusiasts, repudiating caste and other Brahminical doctrines, are almost confined to the Punjaub; but even there they do not form more than 6 per cent. of the total population, being most numerous in the neighbourhood of Lahore.

Material Condition of the People.—The great majority of the people are directly dependent upon their own agriculture. The census returns according to occupation, which are not entirely trustworthy, show 56 per cent. of the total adult males as 'agricultural,' and an additional 12 per cent. as 'labourers.' The condition of the ordinary cultivator varies considerably. In Madras and Bombay, where the Land Settlement is made directly with him, and in the Punjaub also, where the settlement is made with the village community of which he is a member, his lot is distinctly a happy one. He is a peasant proprietor under favourable circumstances, with every stimulus to exertion and security for the fruits of his toil. In Bengal, however, in Oude, and in great part of the N.W. Provinces, where the land-tax is paid primarily by the landlord, his position is not so good. Under exceptionally favourable circumstances, as in the alluvial swamps of Eastern Bengal, where spare land is yet abundant, he can maintain himself in comfortable independence; but throughout the greater part of the Gangetic valley, the small farmers are little better off than were the cottiers of Ireland before the famine in that country, and the day-labourers are hardly removed above serfdom. Both rent and wages are commonly paid in kind, and the rates of each are directly determined by the minimum at which life can be supported. In addition, the village usurer or Mahajan (q. v.) is always at hand to appropriate the profits of a favourable season. It is in these same tracts, as might be expected, that the pressure of population upon the soil is most severe. The Hindu will not permanently leave his native village, even when there is abundance of uncultivated jungle not far off; and systematic emigration has as yet proved a failure. But despite great poverty and the hopelessness of improvement, the ordinary cultivator is by no means miserable. His patience and good temper have become a proverb; and the charitableness inculcated by his religion renders any poor-law superfluous. The total number of coolie emigrants in 1875 was only 25,325, of whom 20,230 embarked from Calcutta, 1886 from Madras, and 3209 from French ports. The destination was either Mauritius, Natal, or the W. Indies. These numbers indicate no increase during the previous ten years. The number of emigrants to the tea districts of Assam in the same year was 22,288, and from Bengal to Burmah 7397. About 70,000 coolies annually cross from S. India to work on the coffee plantations of Ceylon.

Health and Sanitation.—The sanitary commissioner accepts as approximately correct a calculation which estimates the average duration of life in I. at 30 years and 8 months, at which rate the average mortality would be 32·57 per thousand. In many parts of the country, especially in Bengal, cholera exists in an endemic form; but fevers and bowel complaints are ordinarily the most fatal forms of disease. It has been noticed that the cold season is the most unhealthy for the natives. Smallpox continues to cause many deaths annually, though inoculation is now prohibited over large areas, and voluntary vaccination is on the increase. At the capital cities there are excellent medical hospitals; charitable dispensaries, with Government subsidies, are scattered throughout the rural tracts; and quinine, the only real preventive and remedy in the case of fever, is now cheaply produced in the country, and widely distributed. Bad water and bad drainage are acknowledged as the main cause of much of the disease in I. The new water-supply and sewage-scheme has had some effect in improving the health of Calcutta, and a similar result may be expected from the works at Madras.

Education has been widely disseminated of late years. Though much yet remains to be done, I. will now bear comparison with the more backward countries of Europe. The present system dates from 1854. The plan laid down in that year by Sir C. Wood (Lord Halifax) established an education department for each province; founded universities for granting degrees (after the model of the University of London), with which the existing colleges were affiliated; reorganised the middle-class schools in which English is taught; and encouraged the indigenous village schools for giving primary instruction in the vernacular. This latter class of schools has always existed throughout I.; but up to the date already mentioned, efficient vernacular teaching had been the proud monopoly of the missionaries. Universities were founded at the three presidency towns in 1857, when the Mutiny was at its height. There are now forty affiliated colleges, besides special institutions for the study of Oriental languages, medicine and engineering, and schools of art. In the year ending March 1875, the total number of candidates at the three universities for the entrance examination was 5280, of whom 2012 passed; 175 persons passed for B.A., and twenty-one passed for M.A. with honours. During the same year there were, throughout all I. under British administration, 74,050 educational institutions of all kinds, attended by 1,660,202 pupils. The work of female education, closely connected with *zenana* visitation, still remains almost confined to missionaries and their wives.

The *Commerce and Trade* of I. is very large, and annually increasing. It may be divided into maritime commerce (foreign and coasting), internal trade, and the trans-Himalayan traffic. For the year 1875, the total number of sailing and steam vessels, with cargoes and in ballast, that entered British Indian ports was 19,875, with a tonnage of 4,903,827; of these, as many as 13,528 vessels (including 10,002 native craft), with a tonnage of 2,461,266, were engaged in the coasting trade. The foreign trade proper is, of course, mostly conducted direct with the United Kingdom; next in order come Ceylon, the Red Sea and Persian Gulf, the Straits Settlements, China, Mauritius, France, Australia, and the United States. The total value of the imports, including Government stores and treasure, was £44,363,134; of the exports, £57,984,539. The former of these figures is somewhat below, and the latter somewhat above, the average for the last ten years, which shows a general balance of trade in favour of I., amounting to about £11,000,000 sterling annually. This balance is supposed to be satisfied by the Indian Secretary's bills on I., which are sold periodically in London. Striking an average for the last ten years, the imports of treasure (almost solely silver) exceed the exports by an average of nearly £10,000,000 a year, so that the strict balance of trade, as shown by the excess

of exports over imports in merchandise proper, may be placed at £20,000,000 sterling annually. Among the imports the following are the chief items for 1875:—Cotton manufactures, £16,263,560, the largest total yet reached, as compared with £11,849,214 in 1866; cotton twist and yarn, £3,157,780, as compared with £1,961,144 in 1866; metals, manufactured and unmanufactured, £2,607,096; machinery and millwork, £1,185,943, as compared with £586,182 in 1866; Government stores, £1,576,851. Among the exports, raw cotton, 627,209,661 lbs., valued at £15,257,342, against 803,150,424 lbs., valued at £35,587,389 in 1866; opium, £11,956,972, a very constant item; grains and pulse (including rice, but excluding wheat), £4,765,334; jute and manufactures of jute, £3,484,522, against £1,083,522 in 1866; seeds, £3,235,948, against £1,750,197 in 1866; hides and skins, £2,677,767, against £609,803 in 1866; indigo, £2,576,302; tea, £1,963,550, against £309,899 in 1866; cotton manufactures, £1,426,538; coffee, £1,307,919, against £785,102 in 1866. It will thus be seen that the apparent decline in exports is solely due to the decreased value of cotton, as compared with a period when the American ports were closed; and that the new staples of jute, seeds, hides, tea, and coffee, show a most satisfactory progress. It must always be recollected that these figures include British Burmah, but exclude Ceylon. The internal trade passes by road, water, and railway. Few statistics on this subject are available, but the traffic is known to be very great. In 1875, the railways throughout I. carried a total of 4,388,649 tons of goods and minerals, besides 505,621 head of live stock. The trade statistics of the Punjaub, which are not entirely trustworthy, show a total of about 1,520,000 tons, valued, but evidently overvalued, at 16 millions sterling. A most comprehensive system of boat registration, which has lately been established on all the great waterways of Bengal, reveals an annual traffic within that province, in heavy goods alone, of about 30 million tons The entire trade of Patna, the emporium of Behar, is estimated at about 1½ million tons a year; the registered river-borne traffic for six months only was valued at over 3 millions sterling. The trans-Himalayan trade passes by recognised mountain passes either through Afghanistan, Cashmere, or Nepaul.

Manufactures throughout I. are undergoing a change. Many old industries, such as cotton and silk weaving, and salt-making, have been largely superseded by the competition of the cheaper imported articles. Specialties, however, such as the brocades and embroidery of the Punjaub, the saddlery of Cawnpore, the jewellers' work of Trichinopoly, Cuttack, &c., and the trade of potters and braziers generally throughout the country, still flourish; European capital, also, has introduced, and is continuing to introduce, new employments for the disengaged or surplus labour. Indigo, tea, and coffee each require a large number of hands; while the cotton-mills of Bombay, and the jute and paper mills of Bengal, are illustrating the capacity of the natives for new forms of skilled handicraft. In 1872 there were in Bombay 18 steam factories, employing 4500 looms, 405,000 spindles, and 10,000 hands, and turning out daily 100,000 lbs. of yarn. Apart from the local demand, the produce is finding its way into the markets of Russia, America, and China.

Means of Communication have been immensely improved under British rule, and it is by their efficiency in seasons of drought, more even than by irrigation, that local scarcity can be prevented from intensifying into famine. Railways, which now stretch over the length and breadth of the peninsula, were partly no doubt laid out for military purposes, following the lines of the Grand Trunk Roads. The main lines have been constructed by private companies, to whom the Government has guaranteed 5 per cent. interest on their outlay, retaining an option of purchase. Since the time of Lord Mayo, it has been determined that future lines, which must chiefly be feeders, shall be made and worked directly by the State. At the close of 1875, the total length of lines open (both guaranteed and State, and including some railways in native territory) was 6497 miles; the number of passengers, 26¾ millions; the number of tons of goods and minerals carried, 4,388,649; the gross receipts, £7,412,079; the gross expenses, £3,764,311; the total capital expended, £102,128,893, of which 92 millions was on guaranteed railways; the number of persons killed was 208, injured, 267. The telegraph statistics for the same date (including Ceylon) are as follow:—Miles of wire, 33,798; offices open, 225; messages (including State and free), 883,727; receipts, £203,881; expenditure, £338,731. The postal statistics show a very large increase, amounting almost to twofold, during the past ten years. In 1875 the number of post-offices open was 3408; the establishment numbered 25,942 persons; the revenue was £719,587; the expenditure, £729,191.

Administration.—Subject to the distant control exercised by the Secretary of State in England, who is aided by a salaried council of fifteen members, the supreme government of I. is vested in the Governor-General or Viceroy, the latter of which titles was assumed after the fall of the East India Company in 1858. The Governor-General in his turn is assisted by two councils, the Executive and the Legislative, and all his public acts run in the name of 'the Governor-General *in* Council.' Theoretically, he is supreme at the council board, and on him rests the sole responsibility; but in practice his position somewhat resembles that of the Prime Minister in a Cabinet. The Executive Council is composed of the Commander-in-Chief and five other 'members,' each of whom is intrusted with a special department; the Legislative Council contains in addition several non-official members, including a few distinguished natives. For ordinary civil administration the whole area of British India is divided into that portion which is directly under the Governor-General, and the Provinces, nine in number, which have each a separate government. The Native States also may be divided on the same principle. The four tracts of Ajmere, Berar, Mysore, and Coorg, under the Governor-General, represent recently-acquired territory, which it has not been thought convenient to attach to any of the old-established provinces. The separate administrations are the 'Presidencies' of Madras and Bombay (including Scinde), each under a governor appointed from England; the Lieutenant-Governorships of Bengal, the N.W. Provinces, and the Punjaub; and the Chief Commissionerships of Oude, the Central Provinces, British Burmah, and Assam. To nearly all these provinces are attached a larger or smaller number of Native States; but by far the more important of the feudatory chiefs, whose territory lies in the centre of the peninsula, are in immediate relation with the supreme government. The Governors of Madras and Bombay have each both Executive and Legislative Councils; Bengal has a Legislative Council; the remaining provinces are under the sole authority of their respective Lieutenant-Governors or Chief Commissioners. Each province is divided into districts or *zillahs*, and the districts are usually subdivided into subdivisions, called sometimes *talooks*. The districts, which vary much in size, constitute the field of work of one responsible official, known as a Collector-Magistrate or Deputy-Commissioner, who is required to perform an infinite variety of administrative duties. The judicial work proper rests in other hands. The entire civil staff may be arranged in three classes—the covenanted servants, who are selected by open competition in England; the uncovenanted servants, who are nominated in India; and the officers of the Indian staff corps who have received civil employment. The covenanted servants, the inheritors of Haileybury traditions, and 'the Indian Civil Service' *par excellence*, enjoy a monopoly of the higher appointments in what are known as the Regulation Districts, the old-established regions in which the codes are in full force. The other two classes are eligible for the non-Regulation Districts, including the whole of the Punjaub and Oude.

Army.—For military purposes the old threefold division into the Presidencies of Bengal, Madras, and Bombay, is maintained; everything that was not historically included under either of the two last mentioned being arbitrarily placed under Bengal. But this classification is only kept up as a staff distinction, for the troops of each Presidency are by no means confined within their proper geographical limits. The total strength of the army in 1875 amounted to 190,175 officers and men, of whom 104,174 belonged to the Bengal establishment. The European army numbered 66,313, of whom 6086 were officers, including 2357 belonging to the staff corps. The native army numbered 123,682, of whom only 180 were officers. Among the Europeans 12,305 were artillery, 4347 cavalry, 354 engineers, 45,962 infantry; while 151 are returned as general officers unemployed. Before the Mutiny of 1857 the army of the Company was composed of about 45,000 Europeans and 232,000 natives. The European troops are for the most part housed in new and healthy barracks, in connection with certain recognised hill sanitariums; and through communication by rail is now open to every important station except Peshawur and Hydrabad. The death-rate in 1874 was

only 1·389 per cent. as opposed to an average of 2·299 per cent. for the previous ten years. The British forces are chiefly stationed in the Punjaub and along the valley of the Ganges. The military expenditure in 1875 was £15,375,159, of which £3,617,778 was spent in England. The total shows a considerable decrease during the past ten years. To the volunteer corps was allotted £13,248. The above figures, of course, exclude the various armies of the Native States, which are estimated to number 314,598 men, with 3488 serviceable pieces of artillery.

Revenue and Expenditure.—Owing to the constant changes in the system of keeping accounts, it is almost impossible to give a sketch of the finances of I. which shall not be misleading. Since 1872 both revenue and expenditure have been affected by the transfer of certain items to 'Provincial Services,' in accordance with a reform inaugurated by Lord Mayo; and the present finance minister, Sir J. Strachey, proposes to extend this principle. On the expenditure side there is a fundamental distinction drawn between ordinary expenditure, and that on 'public works extraordinary.' These latter are officially defined as 'public works that the Government have decided may be carried on by loans, if necessary.' As a matter of fact, they represent the capital account of a commercial undertaking; and as the Government have now resolved to construct railways themselves, this heading of extraordinary expenditure is evidently destined to maintain itself. In addition, the item of 'Famine Relief' has recently appeared on the expenditure side, amounting during the four years from 1874 to 1878 to an estimated total of £11,000,000, or an average of more than £2,000,000 a year. The balance-sheet for the financial year ending 31st March 1875 may be thus stated:—Gross revenue, £50,570,171; total expenditure, £54,500,545, of which £4,249,571 was for public works extraordinary, and £2,237,860 for famine relief; deficit, £3,930,374. The budget estimates for 1877–78 place the revenue at £52,192,700; the expenditure at £56,442,400, including £3,628,000 for public works extraordinary, and £2,150,000 for famine relief; deficit, £4,249,700. For 1875 the chief items of revenue were as follow:—Land revenue, £21,296,793; opium, £8,556,629; salt, £6,227,301; excise and forest, £2,929,424; stamps, £2,758,042; customs, £2,678,479; public works, £1,047,735. The income-tax, which had realised £2,000,000 in 1871, was finally abolished in 1873. The chief items of expenditure in 1875 were:—Army, £15,375,159; refunds, charges of collection, assignments under treaties, &c., £9,510,766; interest on debt, &c., £5,412,055; provincial services (police, education, &c.), £5,148,744; State railways (capital), £3,014,180; public works, £2,504,230; law and justice, £2,298,180; famine relief, £2,237,860; railways (guaranteed interest), £1,483,839; loss by exchange on home remittances, £897,878. The total debt of I., exclusive of the £12,000,000 sterling forming the capital stock of the East I. Company, amounted in 1875 to £118,333,794, of which £70,000,000 bore interest in I. and £48,000,000 in England. The total shows an increase of £28,000,000 during the past ten years. The most important financial reforms required in I. are admitted to be the abolition of inland customs lines, and the equalisation and reduction of the salt duties. The Government is also pledged to abolish the import duties on cotton goods with the least possible delay.

The *Land Revenue* in 1875 amounted to £21,296,793, or 42 per cent. of the total receipts; and its collection forms so large a portion of the duties of the administrative staff, that the district officer is still commonly styled 'Collector.' Including a few local rates and cesses, the average incidence of the land-tax throughout British I. is estimated to be 9½d. per acre of gross area, 2s. 8d. per acre of revenue-paying cultivated area, 13s. 1½d. per adult male agriculturist, and 2s. 4½d. per head of total population. But the incidence, no less than the mode of assessment, varies extremely in the different provinces, being 3s. 10½d. per head in Bombay, and only 1s. 2¾d. in Bengal. This tax, which may more properly be regarded as the rental reserved by the State as its proprietary right in the soil, is of extreme antiquity in I., being indeed indigenous to all settled Oriental countries. The tax is universally paid in cash; and numerous permanent interests in the soil have in many provinces been suffered to grow up between the State and the cultivator. In Bengal a permanent settlement of the land revenue was adopted by Lord Cornwallis in 1793, in accordance with which the *zamindars* or official rent-collectors were acknowledged as ordinary English landlords, and a rent-charge was fixed in perpetuity. In Madras the *ryotwary* system proper is in force, by which an annual settlement is made with each separate cultivator. In Bombay, the system is also *ryotwary*, except that the settlement lasts for thirty years. In the N.W. Provinces, a thirty years' settlement is made with the recognised proprietor of each village or township, whether such proprietor be the village community itself, a landlord proper, or a family group of landlords. In Oude, the settlement, made after the Mutiny of 1857, has conferred rights in perpetuity on the *talookdars* or large landlords. In the Punjaub the village communities, which have maintained their integrity more fully than elsewhere in I., pay the revenue assessed for periods of thirty years; and in the small province of Assam the village head-man is responsible for the annual assessment. There can be no doubt that the position of the cultivator is universally better where the settlement is made directly with himself. Whether the assessment should be fixed or variable is still a matter of discussion.

The monetary system of I. is based upon a silver standard alone. The unit is the rupee, weighing 180 grains (165 pure), a coin which is said to have been first introduced in 1542. Its nominal value is about 2s., but the exchange with England has been known to fall to 1s. 7d. It is subdivided into sixteen annas, each of which again contains twelve pies. The anna, therefore, is equal to three halfpence, and the pie to half a farthing. Several of the larger Native States still retain the prerogative of coinage, but the only two Government mints now open are at Calcutta and Bombay. The former gold coins—the Mohammedan mohur = 16 rupees, and the Madras pagoda = 3½ rupees—have practically ceased to be in circulation. Enumeration in account is effected by means of lacs and crores, the former meaning 100,000, the latter 10,000,000. In the year 1875 there was coined £14,034 in gold, £4,896,884 in silver, and £111,334 in copper, and the mint profit was £159,021. Chartered banks are established at the three Presidency towns; but the paper currency is for the most part a direct Government issue of promissory notes, which may be cashed at all the local treasuries within the circle of issue. The average amount of note circulation in 1875 was £10,670,407, and the profit on issue was £198,015. The unit of weight throughout the greater part of I. is the *seer*, which, as fixed by Government, exactly corresponds to the metrical kilogramme, being equal to 2·205 lbs; but this has nowhere come into use. For practical purposes the *seer* equals 2 lbs. The table is 16 *chuttucks* = 1 *seer*, 40 *seers* = 1 *maund* or 80 lbs. The unit of land measure is the *beegah*, which again is extremely variable. The Government standard *beegah* is equal to 14,400 square feet, or almost precisely one-third of an acre. The *seer* is used not only for weighing, but also for liquid measure. The price of grain is estimated by the number of *seers* that may be obtained for a rupee.

The *Native States* are more particularly described under their several names. The most important are the ancient Hindu states of Rajputana, which cover 128,126 sq. miles, and contain a pop. of 9,000,000; Hyderabad, or the Dominions of the Nizam, the first Mohammedan potentate in the peninsula, area, 80,000 sq. miles, pop. 9,000,000; the three great Mahratta states of Baroda, Gwalior, and Indore, ruled over respectively by the Guicowar, Scindiah, and Holkar, with a total area of 45,593 sq. miles, and a pop. of 5,000,000; the Himalayan valley of Cashmere, whose chief owes his power to a British grant, area, 79,784 sq. miles, pop. 1,537,000; the flourishing southern states of Travancore and Cochin, area, 8091 sq. miles, pop. 2,909,732. The total revenue of all the chiefs is estimated at £14,500,000 sterling; the tribute they pay to the British is only £741,465. It would be hazardous to attempt to define the exact relations between these feudatories and the paramount power. Of the 153 chieftains who are recognised, some are mere heads of wild hill tribes, others are really subject noblemen or squires, while those named above possess the majority of the attributes of independent sovereignty. None can exercise the right of adoption without an express grant or *sunnud;* and the greatest of them, when admitted to the presence of the viceroy, presents his *nuzzur* or present, which is throughout the East the acknowledged mark of inferiority. They may not levy war against one another, and a guarantee for internal order exists in the right of dethronement and the establishment of a temporary British administration, which has not seldom been exercised by the paramount power.

The French and the Portuguese still retain territory in I. The French capital is Pondicherry (q. v.), on the Coromandel coast; the colony sends a member both to the Versailles Senate and the House of Representatives. The Portuguese seat of government is the city of Goa (q. v.). Many Christians of mixed Portuguese descent are to be found scattered through British territory, especially in the neighbourhood of Dacca and Chittagong, where they are known as Feringhees (q. v.). The Dutch settlements, of which Chinsurah on the Hooghly was the chief, were ceded to Great Britain in exchange for the island of Java in 1825. The Danish settlements of Tranquebar and Serampore were transferred to the East India Company in 1845, in consideration of the sum of £125,000.

History.—The history of I. is the record of a succession of waves of conquest, which almost without exception have burst upon the country from the N.W. In early prehistoric times we may picture to ourselves I. as inhabited by three races, each of which might well claim to be regarded as aboriginal. In the S. were the Dravidian peoples (q. v.) who still hold their own in language and national characteristics, though they early accepted the faith of Brahminism from the Aryan invaders. Siva-worship and the adoration of the *linga* are thought to be the contribution of the Dravidians to modern Hinduism. In the centre of the peninsula were uncivilised tribes, dark in colour and negroid in physiognomy, with whom the Aryans first came into collision, and who are now represented by the hill tribes of Koles and Sonthals, and perhaps the Gondhs, but whose blood is largely to be found in all the Hindu low castes. Sorcery and the practice of human sacrifice are peculiar superstitions of these tribes. Finally, near the N.E. frontier and along the Himalayas was a race of Thibetan or Chinese origin, who may be now identified most distinctly in the numerous caste of Kochs with its many offshoots. It is in this country that the impure mysteries of the Tantras retain their firmest hold.

It is impossible to fix even an approximate date for the first Aryan immigration. It is only certain that the invaders came from the N.W., that they drove out or enslaved aboriginal inhabitants of a darker hue than themselves, and spread very gradually S.E. along the valley of the Ganges, in which tract alone (Hindustan Proper, q. v.) do they still form the bulk of the population. It was partly by their superior physique, but still more by their finer intellectual and moral organisation, that the Aryans exercised their dominant influence over the indigenous races of the entire peninsula. Theirs was not an invasion of conquest, such as leads to a warfare of extermination, but rather the imposition of a higher civilisation, justified by the permanence of its results. The invaders carried with them the germs of the two religions—Hinduism and Buddhism—which still constitute the faith of about one half of the human species. The history proper of I. does not commence until the Hindus, as we may call the amalgamated population, are firmly settled in the land. The prior events are only matter for conjecture. The war of the Mahabharata may preserve some relics of historical fact, but their discovery is now even more impossible than in the analogous cases of the Trojan War or the Niebelungen Lied. The earliest authentic facts we possess come from the Greek historians, who recognised the general unity of the races inhabiting the country, and also the exceeding density of the population. They further teach us that I. never formed one solid empire, but was always broken up into states of varying power and area.

The invasion of Alexander, also from the N.W., is the next fact in Indian history. His army refused to follow him beyond the region of the Punjaub; but the effect of this first penetration of Europeans into I. spread much wider. A new civilisation, and above all a new style of art, were disclosed to the Hindus, and a direct route for maritime commerce was opened by the naval expedition of Nearchus. Recent archæological discoveries have shown that Hellenic influence, exhibited in coins, sculpture, and architecture, remained for some time predominant in the N.W. It is by the light of these facts that two obscure events in Indian history may perhaps be rightly understood. These events are the immigration of a supposed Scythian race, whose descendants are to be traced in the Jats, the modern Sikhs, and the constant allusions to be found in the Hindu chronicles treating of this period to the Yavanas, a name that connects with Ionia and Javan, and is etymologically interpreted to mean 'goers.' This period also saw both the rise and downfall of Buddhism, a most curious and perplexing epoch in Indian history. The life of Gautama himself is now fixed by scholars as being almost co-extensive with the 5th c. B.C. Within 150 years after his death, *i.e.*, in 250 B.C., Asoka the King of Magadha held his great council at Pataliputra, the Palibothra of the Greeks and the modern Patna, in accordance with which the doctrines of the new religion were engraved on pillars which still exist, and thus published to the furthest corners of the peninsula. Soon after the commencement of the Christian era Buddhism began to decline. Hiouen Thsang (q. v.), a Chinese pilgrim who traversed great part of I. in the 7th c. A.D., found it everywhere weak and corrupt; and within two hundred years afterwards, the Buddhists had been entirely exterminated from their native country by the victorious Brahminists, who were themselves soon destined to fall before the Mohammedan invader.

The Mussulman invasion of I. is not one isolated event, but a constant succession of inroads and immigrations of hardy barbarians from the mountains of Afghanistan and the steppes of Central Asia, which continued for a period of almost 800 years, from Mahmoud of Ghuzni to Nadir Shah. The N.W. corner of I. was of course the most exposed to these attacks, and it took many centuries before the S. of the peninsula fell under Mohammedan rule. The first recorded conquest is that of Mahmoud (q. v.) of Ghuzni, the great Asiatic conqueror of his generation, who is said to have marched his armies across the Indus no less than nine times. In the year 1001 he led forth his famous expedition against the Hindu shrine of Somnauth in Gujerat, the sacking of which temple is regarded as marking the general downfall of Hindu supremacy. But his dynasty was not long-lived; and a series of petty Mussulman monarchies fixed themselves, for longer or shorter periods, at what were even then recognised as the capital cities of Lahore and Delhi. In 1211 the sanguinary Genghiz Khan (q. v.) swept over the upper plains of Hindustan; and in 1397 Timur (q. v.) the Tartar followed in his track, leaving a name behind him which is remembered by the Hindus at the present day. During this period the Mohammedans were gradually extending their power, not as one empire but as independent dynasties, in Bengal, Malwa, the Deccan, and Gujerat. But the real subjection of I. dates from the first battle of Paniput in 1525, by which Baber (q. v.), a descendant of Timur and the first of the Great Mogfuls, established himself at Delhi, not as a temporary immigrant, but as a step towards his design of erecting a united Indian empire. His son Humayun suffered reverses; but his grandson, Akbar (q. v.) the Great, and his successors, firmly secured their power from Cabul and Cashmere to the S. of the peninsula. I. was thus, for the first time in history, formed into one political unity; but it would be an error to suppose that the Moghul dynasty at any time exercised the real attributes of sovereignty over this wide area. The early emperors were continually in arms, warring not only against their Mohammedan rivals, but also against confederacies of the dispossessed Hindu chieftains who had retired into the inaccessible tract now known as Rajputana. And as soon as these foes were severally defeated, the final causes of the downfall of the Delhi empire began to show themselves. On the one hand, the local Mohammedan officials—the Nazim of the Deccan, the Nawab Nazim of Bengal, the Nawab Vizier of Oude—gradually asserted a practical independence; while the power at court fell into the hands of palace intriguers, who deposed and set up emperors at their pleasure. On the other hand, the subject Hindus took advantage of these dissensions, and as represented by the Mahratta horsemen fought it out on equal terms with their former masters. By this time, also, European nations had come upon the scene.

In the year 1498 the Portuguese admiral, Vasco de Gama, landed at Calicut, on the Malabar coast of Southern I., and his countrymen retained their monopoly of trade for more than a century. The early history of the East India Company (q. v.) has already been given; it will be enough in this place to record the dates of the more important events which changed a corporation of traders into one of the most powerful governments in the world. It was in Bengal, by accident rather than by intention, that the weakness of Oriental power was first demonstrated. The battle of Plassey was won by Clive in 1757; but not till 1765, as the result of the equally decisive victory of Buxar, which brought the British into direct connection with the Moghul Emperor, Shah Alum, was their status of traders definitely exchanged for that of territorial rulers. On 12th August

of that year the Dewani, or financial administration of Bengal, Behar, and Orissa, was formally made over to the Company by imperial grant. It fell to Warren Hastings and Lord Cornwallis (1773-93) to organise these new dominions, and show the possibility of governing I. under European supervision. In the S. of I. a different set of circumstances required to be encountered. The French were there settled as the rivals, and occasionally the successful rivals, of the English; and in addition, Hyder Ali and his son Tippoo illustrated the capacities for warfare, diplomacy, and administration which continually present themselves sporadically in the East. The fall of Seringapatam in 1799 marks the final establishment of British supremacy, which has never since been contested in that quarter. The Governor-Generalship of Lord Wellesley (1798-1805) is generally regarded as the epoch which practically inaugurated the principle that every native prince holds his power subject to the approval of England. The Nazim, the Peishwa, and the Guicowar were compelled to accept subsidiary treaties, the Mahratta confederation was broken by the victories of Assaye and Laswaree, and the Moghul Emperor was restored to his throne at Delhi by a British escort. The next great event in Indian history was the disastrous invasion of Afghanistan (1838-42), which was not justifiable in its origin, and which led to the greatest blow that British prestige has ever suffered in the East. There followed upon this expedition the conquest of Scinde and the Punjaub, the only two outlying corners of I. that yet remained entirely under native rule. Scinde was won by the signal victory of Meanee in 1843; but the Punjaub was not finally annexed till 1849, when the second Sikh campaign was closed by the battle of Gujerat. This annexation was one of the first acts of the administration of Lord Dalhousie, Governor-General from 1848-55, a period which was signalised by the introduction of railways and telegraphs into I., and by the opening of steam communication by the overland route. But Lord Dalhousie's rule was still more strongly impressed upon the native mind by the conquest of the Punjaub beyond the Sutlej, and of Burmah beyond the 'black water,' and by the deliberate enunciation of the doctrine of 'lapse,' in accordance with which the states of Oude, Nagpore, and Sattara successively passed under British administration, away from those who were popularly regarded as their rightful princes. All these changes, whether of civilisation or of policy, profoundly unsettled the minds of the people. The Mohammedans had never forgotten that their government had been overthrown by the British, and all the disinherited chiefs and landlords combined to take advantage of a temporary discontent among the Bengal sepoys. The result was the Mutiny of 1857, which fell most unexpectedly upon those who were actually on the spot, and of which it is now hopeless to attempt to discriminate all the immediate causes. The first outbreak was of a cavalry regiment stationed at Meerut in May 1857, which marched to the neighbouring city of Delhi, and forthwith all the N.W. Provinces, Oude, and Central I. were in a blaze. The Punjaub was firmly held by Lawrence and his able lieutenants, the civil population of Bengal were quiet throughout, the Madras and Bombay sepoys did not mutiny, and the great majority of the native chiefs remained loyal. It were useless to recount the sufferings of the Europeans—men, women, and children—who were thus miserably cut off, or the stern retribution which was afterwards meted out to the rebels. Delhi was recaptured by storm in September 1857; but it was not till the middle of 1859 that the whole of Central I. was finally pacified.

These events led to the last scene in the drama of Indian history. In August 1858 the Act of Parliament was passed by which all the powers of the East India Company were vested in the Queen, and a new system of government (described above) was organised for the country. Lord Canning was the Governor-General through all this troublous time (1856-62), and the first viceroy of the Queen. Since this date there have been various frontier expeditions; but historical interest has centred round questions of internal administration, among which the successful dealing with periodical famine occupies the foremost place. The auspicious tour of the Prince of Wales throughout the length and breadth of I. during the cold weather of 1875-76, and the proclamation of Queen Victoria as 'Kaiser-i-Hind' at Delhi on 1st January 1877, are the only remaining events worthy of notice.

Among books on I. the following are the most valuable:—*The Statement Exhibiting the Moral and Material Progress*, annually laid before Parliament as a Blue Book, of which the number for 1872-73 by Mr. Clements Markham, with maps, is especially useful; *The Statistical Abstract Relating to British I.*, also published annually, giving a comparison by decennial periods; the statistical accounts of each province, district by district, of which the greater part are already printed. These are edited and partly compiled by Dr. W. W. Hunter, who is now commencing an alphabetical Imperial Gazetteer of all I., to supersede Thornton's *Gazetteer*, of which the last edition was published in 1859; *The History of British I.*, by James Mill, continued by Prof. H. H. Wilson; the popular history by Dr. Marshman. For the early periods, Elphinstone's *History of I., the Hindu and Mohammedan Periods* (4th ed. 1864); Elliott's *History of I., as told by its own Historians* (1867), of which posthumous volumes are still appearing; Mr. Talboys Wheeler's three volumes. For special periods, General Briggs' *History of the Deccan*, Prof. Stewart's *History of Bengal*, Grant Duff's *History of the Mahrattas*, Cunningham's *History of the Sikhs*, Sir J. Kaye's Histories of the Afghan Campaign and of the Sepoy War, the same author's memoirs of many distinguished Anglo-Indians, and Dr. Hunter's *Annals of Rural Bengal*, *Orissa*, and a *Life of Lord Mayo* give a most interesting description of various aspects of Indian life. See also Fergusson's *History of Indian Architecture*, Col. Cunningham's *Ancient Geography of I.*, Col. Dalton's *Descriptive Ethnology of Bengal* (Calcutta, 1872), and the numerous works published by Messrs. Allen & Co., the publishers to the I. Office, which are most expensively illustrated.

India'na, one of the United States of America, bounded N. by Michigan and Lake Michigan, E. by Ohio, S.E. and S. by Kentucky, and W. by Illinois. Area, 33,809 sq. miles; pop. (1870) 1,680,637. The surface is generally level, with rolling prairies and deep river-valleys. The chief rivers are the Wabash, Great Miami, the Maumee, and the Ohio. The soil is very fertile, and the climate is variable, the summer heat and winter cold being both intense. There are large forests, especially in the E., of black walnut, red maple, oak, elm, hickory, &c. I. is one of the richest grain-growing States. Large crops of wheat, rye, Indian-corn, &c., are raised, and vines flourish along the Ohio. Hemp, flax, and sugar are produced, and cattle are reared in great numbers. I. has coalfields of about 7700 sq. miles in area; and much of the coal is of the best quality. The manufactures, which are rapidly increasing, comprise woollens, iron goods, machinery, agricultural instruments, &c., but the chief industries are flour-making and wood-cutting. I. is intersected by numerous railways, there being (1874) 3837 miles of railroad in the State. The chief towns are Indianapolis, the State capital, Fort Wayne, Evansville, Terre Haute, New Albany, Lafayette, and Madison. I. was at first part of the French possessions, and was ceded to the English in 1763. Together with the rest of the N.W. Territory it was transferred to the United States by the treaty of 1783. The early settlers suffered greatly from the attacks of the Indians, which were finally put an end to by successful conflicts in 1811 and 1815. I. was made a State of the Union 11th December 1816.

Indianap'olis, the capital of Indiana, U.S., stands near the middle of the State, on the White River, and is connected by rail with many of the great American cities. Its streets are wide and mostly lined with trees, and there is a large park in the centre. There are seventy churches, large state and county courthouses, an imposing chamber of commerce, a masonic hall, oddfellows' hall, academy of music, and many other fine edifices. I. has numerous benevolent institutions, a city hospital, dispensary, national surgical institute, homes for orphans, &c. The city lies in a rich corn-growing district, and has extensive grain and mineral trade, and very large manufactures of iron and brass work, furniture, carriages, cottons, woollens, &c. The first settlement at I. was made in 1819, and the town became the State capital in 1824. Pop. (1850) 8091, (1860) 18,000, (1870) 48,244. A belt railway to surround the city was in course of construction in 1875.

In'dian Ar'chitecture has been best treated in the elaborate publications of Mr. Fergusson, especially *History of I. A.* (Lond. 1876). The subject may be divided into two branches: (1) the indigenous style, and (2) the style introduced by the Mohammedan invaders. The first refers back to the earliest rise of

Buddhism, in the centuries immediately preceding the Christian era. The oldest buildings that remain take the form of rock-cut caverns, which were used either as temples proper, containing images of Buddha, or as monasteries for the habitation of the celibate Buddhist priests. The most primitive of the caves are situated in Behar and Orissa, but all the most ornamented are to be found in Western India. The form of architecture foreshadowed by these rock-temples has been traced in Burmah and Java, and indeed wherever the Buddhist faith is still prevalent. In India Proper a change, or rather a development, of architectural style was caused by the religious revival which restored Brahminism as the orthodox belief. In the temples of the Jains (q. v.), Buddhist features were to a considerable extent retained; but among the Hindus proper a new style of architecture arose, which reached its greatest splendour in the pagodas of the S. But however much a pagoda may differ in outward appearance from a cavern, yet modifications were only gradually effected, and the main plan of the two remains unchanged. The Mohammedan conquerors brought with them a style of architecture, common to the whole people of Islam, which is generally known as Moorish or Saracenic. Both the ground plan, and the general rules of building, are the same for a mosque at Delhi, Constantinople, or Cordova. The monuments of the early Afghan dynasties are of a comparatively rude type. But the wealth and taste of the united Moghul Empire were bestowed on the patronage of architecture above all the other arts. In grace of design, purity of ornamentation, and beauty of material, the tombs, mosques, and pillars of Agra and Delhi have never been surpassed, and it is suspected that the assistance both of Hindu and European artificers was invoked for their erection. Hitherto the British Government has done little for the advance of I. A. The native grandees and princes build themselves palaces according to a style of bastard classicism, for which they find but too much encouragement in some of the monuments which we have raised. But within the past few years, schools of art in the Presidency towns have given encouragement to native taste, and the designs for public buildings have been thrown open to local competition. See Fergusson's *History of Indian Architecture* (Lond. 1875).

Indian Clove Bark. See CLOVE BARK.

Indian-Corn, or **Maize,** was entirely unknown as an article of food in Great Britain and Ireland till the failure of the potato crop in 1846, when, for the first time, public attention in this country was directed to the very important position this grain held as the food corn of the population of a large part of Europe as well as America. In 1847 a large quantity was imported, of which a great part was destined for Ireland, partly on account of private enterprise and partly by contract with the Irish Relief Commissioners, in order to meet the general destitution caused by the want of potatoes, which had been the staff of life throughout the country. The use of the 'yellow meal,' as it was called, caused a great outcry in the workhouses and other places where the relief was administered, but the prejudice soon passed away, and I.-C. has since been an article of considerable consumption for food in Ireland. The imports, which had been practically *nil* up to 1847, are now very important, having been in 1875 1,021,924 tons (value £8,119,957), of which—

602,930 tons	were from the	United States.
193,502	" " "	Turkey.
59,435	" " "	Austrian Territories.
43,689	" " "	British North America.

Of corn-meal in 1875 the quantity imported was 7376 cwts. The use of this grain in Great Britain is not to any extent for human food in its raw state; it is chiefly for feeding purposes, and it is found that no grain is more useful for fattening cattle and pigs, taking weight for weight, and that in judicious mixture it is most valuable for feeding horses which have hard and rapid work. A large quantity is, however, consumed in Great Britain in the form of 'prepared corn,' or, as it is usually styled, 'Corn Flour;' this being the starch of the I.-C. adapted for the food of infants and invalids, and for puddings. This article was patented by Messrs. T. Kingsford & Sons of Oswego, U.S., in 1848, and was immediately introduced into Great Britain, where it attracted considerable attention. The original makers still continue to occupy the first place in the trade, which is now of very considerable dimensions, their output being upwards of 26 tons per diem; but the manufacturers of 'Corn Flour' in Scotland, chiefly Messrs. Brown & Polson of Paisley, do a very large business, and the article is in everyday use among all classes of the community. The calyx of the seed-producing flower of the I.-C. is a tough lance-shaped leaf of 6 or 8 inches in length, and is well known as the covering of the oranges which are imported in enormous quantities from St. Michael's and the other Azore islands. It is also used in many countries as the stuffing of beds, for which it is particularly suitable. See MAIZE.

Indian Fig. See PRICKLY PEAR.

Indian-Ink, properly **China-Ink,** a preparation much used by artists and draughtsmen, is composed of very fine lamp-black, made into a paste with a proportion of gelatinous matter, perfumed with musk or other odorous matter, and cast into cakes or sticks. Much factitious I.-I. is manufactured in Europe, but it is immensely inferior in quality to that made in China or Japan.

Indian Matting is made from *Cyperus corymbosus*, a sedge-like plant common about Calcutta, &c. The flowering stems when green are split into three or four pieces, which, in drying, contract so that the edges overlap each other; in this state they are woven into mats for floors of rooms, &c.

Indian Ocean (the *Erythra* of Herodotus) separates Africa on the W. from Malaysia, Australia, and Tasmania on the E., and extends from India and Beloochistan on the N. as far southward as the Antarctic Circle. From the Cape of Good Hope to South Cape in Tasmania its breadth is upwards of 6000 miles, and its area has been variously computed at from 17 to 25 millions of sq. miles. The I. O. includes several minor seas, as the Red Sea, Arabian Sea, Persian Gulf, and Bay of Bengal. Ceylon and Madagascar are its chief islands, the others—if we exclude the Indian Archipelago as bounding rather than belonging to the I. O.—being neither large nor numerous; and the most important rivers that flow into it are the Zambezi of Africa, the Euphrates, Indus, Ganges, and Irawadi of Asia, and the Murray of Australia. The temperature of the I. O. is exceptionally high; periodical currents are numerous, the constant, few; chief of the latter being the Mozambique Current, the Agulhas or Cape Current, the Equatorial, and the Counter-Current. (See CURRENTS, OCEAN.) Pearl-fishing is the leading industry connected with its waters. The Monsoons (q. v.) of the I. O., by rendering navigation peculiarly easy, early led the Phœnicians to establish trading settlements both on the Red Sea and Persian Gulf; and Humboldt's identification of Ophir, whence Solomon procured apes (*kophim*), peacocks (*thukkiim*), and sandalwood (*algummin*), with India—these names being all of Sanskrit origin—shows at how remote a period a regular communication between East and West by way of the Arabian Sea must have existed.

Indian Red, or **Persian Earth,** is a marone-coloured ferruginous earth used as a painter's pigment, and obtained from the hills near Chingleput as well as from Persia. An imitation is manufactured in this country by mixing oxide of iron with colcothar.

Indian Territory, a country set apart by the United States Government as a permanent home for such Indian tribes as can be induced to settle. Area, 68,991 sq. miles; pop. (1870) 68,152, of whom 59,367 were Indians (24,967 on reservations and at agencies, more or less civilised, and 34,400 nomads), 2407 whites, and 6378 coloured persons of African descent. Among the tribes settled here are the Cherokees, Choctaws, Creeks, Chickasaws, Seminoles, &c. The country is bounded N. by Kansas, E. by Missouri and Arkansas, S. and W. by Texas; it slopes gently from the Rocky Mountains in the extreme N.W. to the basin of the Mississippi, and is watered by the Arkansas River, by its tributaries the N. and S. Canadians, Cimarron, Neosho, &c., and by the Red River, that forms the southern boundary. The Cross Timbers, a belt of forest, from 5 to 30 miles broad, separate the eastern region of rich upland prairies, luxuriant woodlands, and fertile river-bottoms from the sterile tableland of the N.W., where the vegetation is limited to the thorny cacti, yuccas, and grey sagebush. In the S.E. are the low ranges of the Washita, Poteau, and San Bois mountains. The climate is warm, and droughts are frequent, but farming is carried on to a considerable extent by the Indians. In 1872, 204,674 acres of improved land

yielded 6,739,355 bushels of wheat, &c., and the total value of real and personal property, on which no taxes are levied, amounted to 16,987,818 dollars. Among the towns, none of which are of any size, are Tahlequah, capital of the Cherokee country; Caddo, capital of the Choctaws; and Vinita, the junction of the Missouri, Kansas, and Texas and S.W. branch of the Pacific Railways. One newspaper is printed in the Cherokee language, another in Creek or Choctaw. The government is in the hands of the various tribes. They are not represented in Congress, but as occasion requires, send their chiefs to Washington to state their complaints. The territory, originally set aside in 1832, had an area of 195,274 sq. miles, but was diminished by the withdrawal of Kansas and part of Nebraska. During the Civil War several of the tribes took the side of the S., and were temporarily held to have forfeited their lands.

Indians, American. The aboriginal inhabitants of N. and S. America received the name Indians from the belief of the discoverers and early conquerors of the New World that America was a part of Asia. Ethnologically the various tribes seem to have sprung from a common stock, but their relation to the races of the Old World has not yet been clearly determined. No links have been discovered connecting their speech with Old World tongues, and even the common features of their own numerous dialects cannot be precisely defined. Physically they are lithe and slender, of a reddish copper colour, with long, black hair, prominent cheek-bones, dark eyes, and low foreheads. They display greater uniformity in their mental and bodily characteristics than can be found in any other races spread over an equal extent of territory. They are remarkable for apathetic endurance of pain, sullen haughtiness, courage, dissimulation, and cruelty, and excel all other savage races in reflectiveness, perseverance, and passionate intensity of feeling. Their languages are distinguished by the endless wealth of conjugational forms, by the tendency to express a cluster of naturally connected ideas by a single word, their inflexional variety enabling them to indicate very subtle shades of meaning. Efforts have been made to trace an affinity between their speech and the Mongolian, Polynesian, Tungusian, &c., but most scholars of any weight regard such attempts as futile and fantastic. About four-fifths of N. America was formerly held by tribes speaking, at most, not more than four distinct tongues, viz., the *Eskimo*, spoken along the shores of the Arctic Ocean; the *Athabascan*, spoken in the lands S. of the Eskimo region, between Hudson's Bay and the Rocky Mountains; the *Algonkin*, the most rich and widespread of all N. American Indian tongues, spoken from about 50° N. latitude, as far S. as the confluence of the Ohio and Mississippi, W. to the Rocky Mountains, and E. to the Atlantic, the Algonkin tribes especially clustering along the Mississippi Valley, the *Dakota* or *Sioux*, spoken in the lands of the Dakotas, between the Mississippi and the Rocky Mountains, and from the Saskatchewan Sea to the Arkansas River. These linguistic divisions correspond to the four great families of North American tribes. For Eskimo see the separate article. Among the numerous tribes of the Athabascans were the Chepewyans, Dog-Ribs, Sussees, Apaches, Slave, and Beaver Indians; to the Algonkin family belonged the Satiskaas or Blackfeet, and the Chippeways; while the Dakota collection of tribes included the Santees, Brulees, Tetons, Urkpapas, Ogalallahs, Yanktons, &c. Within the vast territory of the Algonkins lay the *Iroquois*, who spoke a different language from the Algonkins and includes the Hurons, Eries, Tuscaroras, &c. Other great families, though inferior to the four principal tribal clusters, were the *Chahta-Muskoki*, lying along the lower Mississippi, and comprising the Seminoles, Muskokis or Creeks, Choctaws, Chicasas, Alabamas, &c., and the *Cherokees* who dwelt along the Tennessee River and held parts of what are now Georgia and Alabama. The Pawnees and Comanches, tribes lying along the Mexican frontier, differ in speech from the Dakotas, though their dialects have erroneously been included under the Dakotas. These great families held N. America from the Arctic Ocean S. to Mexico, from Mexico S. to Chili; and at the time of the Spanish conquest the region between the Pacific and the Gulf of Mexico and the lands on the western seaboard of S. America were held by peoples originally of the same stock as the nomads of N. America, but possessing a very high civilisation. For these, see MEXICO and PERU. See also INDIAN TERRITORY, and Schoolcraft's *Historical and Statistical Information Respecting the Indian Tribes* (6 vols. 4to, 1851–56); Ludewig's *Literature of American Aboriginal Languages*, Field's *Essay towards an Indian Bibliography* (New York, 1873); for the Algonkin, the works of Duponceau, Pickering, and Gallantin; for the languages of S. America, Von Martius' *Beiträge zur Ethnographieund Sprachenkunde Amerikås* (Leips. 1867); and A. d'Orbigny's *L'Homme Américain* (Par. 1839); and as an aid to the comparison of N. and S. American languages, J. J. von Tschudi's *Quichua Sprache* (Vien. 1853).

Indian Yellow, or **Puree**, is a yellow pigment, imported from India and China, and much used by artists, both as an oil and a water-colour. The substance is apparently of animal origin, but its source is not yet accurately known. Chemically it consists of an acid substance, pureic or euxanthic acid, combined with magnesia.

India-Rubber. See CAOUTCHOUC.

Indica'tor. See HONEY GUIDE.

Indic'tion, a word primarily signifying a tax, but afterwards a chronological period or cycle of fifteen years. It first began to be used by Church writers in the time of Athanasius (4th c.). The practice was formally adopted by the popes in the 12th c., and the number of indictions was reckoned from the birth of Christ, which, however, does not correspond with the first, but the fourth year of an I. The rule, therefore, for finding the I. of any year in the Christian era is to add 3, and divide by 15. The quotient will give the I., and the remainder the year of the I.

Indict'ment is the name in England and in Scotland of the written accusation of crime against any one who is to be tried before a jury. In England, in common cases of felony and misdemeanour, the clerk of indictments prepares the document from the depositions returned to the court by the committing magistrate. Sometimes the I. is framed by a barrister or crown draftsman, in which case the clerk only passes it, receiving his fee as if he had drawn it. The names of the witnesses for the prosecution are written on the back of the I. In Scotland, the I. runs in the name of the Lord Advocate, and is addressed to the prisoner.

Indiges'tion, or **Dyspep'sia**, is the term used to indicate that state of the stomach in which it is incapable of performing its natural and healthy functions. It is, therefore, an abnormal functional state, which is sometimes due to sympathetic relations with other organs which are themselves in a morbid condition, the irritation being due to reflex action; thus vomiting is frequently associated with disease of the lungs, brain, liver, and uterus, and is an early result of shock from injuries or surgical operations. The term is more frequently applied to disease processes in the stomach and alimentary canal, such as a scanty secretion of the gastric juice, resulting in long retention of food by the stomach owing to slowness of digestion. This gives rise to a sensation of weight and uneasiness at the pit of the stomach, and sometimes to severe pain both in the stomach and alimentary canal, owing to the irritation of the unaltered ingesta, which frequently appear as such in the stools. Food in this condition is peculiarly liable to decomposition with the evolution of fetid gases, causing flatulence and eructations, prominent symptoms in all cases of I. Loss of appetite is a common symptom of I., but the appetite is occasionally excessive, and even ravenous. Nausea and vomiting frequently occur immediately after a meal, or after the lapse of two or three hours, and the food may be ejected in the same condition as when taken, or in an acid condition, or bitter from the admixture of bile.

Treatment.—When I. depends upon congestion, catarrh, or ulceration, the remedies are chiefly dietetic; as a sparing and easily digested diet, and total abstinence from all alcoholic drinks. In severe cases counter-irritants may be applied over the stomach, and the patient may have small quantities of iced water to sip, or small pieces of ice to suck. When there is ulceration, the diet should consist of milk with bread, semolina, sago, tapioca, biscuit-powder, Indian-meal, or iced-milk combined with one-quarter to one-third of lime-water. Constipation should be counteracted by enemata, and astringent medicines should be given, such as oil of turpentine, acetate of lead and opium, alum and tannic acid. The chief rules of treatment are to use albumenoid food in as liquid a state as possible; to par-

take of it in small quantities at a time and at regular intervals; to aid the digestive process by the administration of pepsine or by alkalies, that the food may pass into the intestines and be digested there rather than by the stomach. When mineral acids are prescribed, it should be borne in mind that sulphuric acid is astringent, that hydrochloric acid promotes digestion, and nitric acid secretion. When loss of appetite is atonic, the appropriate medicines are bitters, such as quinine, gentian, calumba, chiretta, &c., combined with mineral acids. See *The Causes, Symptoms, and Treatment of Imperfect Digestion* by Dr. Leared.

Indigir'ka, a river in the E. of Siberia, government of Vakutsk, rises in the Aldansk Mountains, has a northerly direction, and enters the Arctic Ocean after a course of 800 miles.

In'digo, the name of various plants the most important of which belong to the genus *Indigofera*. This genus numbers some 250 to 300 species, spread through all tropical regions, and also abundant at the Cape. The one that yields the chief supply of the beautiful and important blue dye is *I. tinctoria*, now universally grown in India, but whether it is a native of the country is doubtful. It is a shrub 4 to 5 feet high, with twiggy, woody, thin, silvery branches, leaves 1 to 2 inches long, leaflets opposite membranous turning blackish when dried, flowers reddish-yellow in lax racemes 2 to 4 inches long, pods nearly straight, about an inch long. *I. Anil*, a native of the W. Indies and America, is also commonly cultivated in India; it differs chiefly from the above in its short congested racemes and pod turned back like a sickle. An inferior kind of I. is prepared from the leaves of *Wrightia tinctoria* of the dog-bane family, and the leaves of a couple of species of *Marsdeniæ* (natural order *Asclepiadaceæ*) yield a blue dye resembling I. *Tephrosia apollinea*, a native of Egypt and Nubia, also furnishes a kind of I., also *Polygonum Chinense*, a native of China, and, before the E. Indies were opened to trade, the blue colouring matter of *Isatis tinctoria* was largely used throughout Europe. See Woad.

Indigo.

The valuable blue-dyeing substance derives its name from India, the country of its original production, whence it was known to the ancient Romans as *Indicum*. It did not come prominently into use in Europe till the 16th c., and its employment met the most strenuous opposition in all Western countries, laws enacted against its use having continued unrepealed till comparatively recent times.

I. does not exist ready found in the plants from which it is obtained, but is the result of a fermentation to which they are subjected. Two methods of dealing with the plants are pursued in Bengal, in one of which fresh leaves and green stems are employed, and in the other dried leaves are treated. In dealing with fresh leaves, they are thrown in bundles into large stone tanks and covered with water, where, for from nine to fourteen hours, according to the temperature, they are left undergoing a brisk fermentation. When by its colour the supernatant liquor is deemed to have arrived at the proper point, it is carefully drawn off to a cistern at a lower level, into which a dozen of naked men enter, armed with long bamboo rods, and splash about the liquid for two or three hours. Steam machinery is now coming into use for this process of 'beating.' Gradually the liquor passes from its first yellow into a green colour which indicates the formation of I. It is allowed to precipitate, and the supernatant liquid is drained away by degrees. The precipitate is conveyed to a boiler and boiled for two or three hours, after which it is run into a decipping vat or cistern having a false bottom, in which it is allowed to drain. The solid mass is thereafter squeezed in a screw press, cut by wire into cubical pieces of about 3 inches, and placed on wicker shelves to dry. In manufacturing I. with dry leaves, the leaves after drying in the sun are stored for three or four weeks, during which they change from a bright green colour to a pale bluish-grey. In this state the leaves have only to be macerated a short time in the water to give up their tinctorial principle, and the subsequent processes of agitation, boiling, &c., are the same as with fresh leaves.

The theory of the formation of I. now generally adopted is that evolved by Schunk from his investigations of the conditions under which it is obtained from the woad plant. From that plant he isolated a peculiar principle to which he gave the name Indican. Indican is a kind of glucoside, very soluble in water and alcohol, which, under the influence of acids, of weak alkalies, and even spontaneously during the evaporation of its solutions, separates into a sugar indiglucine and indigotine, the essential principle of I. It is therefore supposed that indican is present in all the plants from which I. may be prepared, and that in the manufacturing process the indican is liberated by fermentation and dissolved in the first vat, and that the fermentation and the oxidation in the second vat determines the separation of the indigotine, along with which other products, brown, yellow, and red, are precipitated to form commercial I.

The I. of commerce varies much in quality, appearance, and tinctorial value, as might be expected from the diverse plants, countries, and methods of its preparation. It has been separated into three classes according to the continent of production as follows:—(1) Asiatic I., embracing Bengal, Oude, Coromandel, Madras, and Java varieties; (2) African I., including Egyptian, Reunion, and Senegal; and (3) American I., which comprehends Guatemala, Caracas, Mexican, Brazilian, Carolina, and Antilles. Of these varieties, the most highly valued are Bengal, Java, and Guatemala.

I. is a most valuable and extensively-employed dye-stuff in calico-printing and woollen-cloth dyeing. As indigotine the tinctorial principle of I. is perfectly insoluble in any of the ordinary solvents—water, alcohol, oils, acids, or alkalies; it cannot be fixed upon any fibre till it is brought into a soluble condition. When from any source it takes into its composition two additional atoms of hydrogen it changes to a white colour, and then as white or hydrogenised I. it is readily soluble in alkaline compounds, in which state it is applied to textile substances. By subsequent exposure it quickly again oxidises to its blue colour, and so becomes a very fast permanent dye. There are numerous methods by which blue I. is reduced and prepared for dyeing and painting.

The quantity of I. imported into Great Britain during the year 1875 was 59,608 cwt., of which the greater part came from British E. Indian possessions. The export from British India during 1874 (which was somewhat above the average) was 115,980 cwt., valued at $2\frac{1}{2}$ millions sterling. In Bengal the manufacture is almost entirely in the hands of Europeans, who take land on lease from the landlords, and obtain the plant from the cultivators under an organised system of advances. Since 1860 this industry has rapidly decayed in the Gangetic delta; but throughout N. Behar, and especially in Tirhut, the area under I. is on the increase. The seed requires to be renewed annually from the N.W. Provinces. The crop is very uncertain, but a favourable year will return cent. per cent. upon capital.

In'dium, this metallic element was discovered by Reich and Richter in 1863 during the spectroscopic examination of the zinc-blende of Freiberg. It is a very scarce element. The Freiberg blende, containing 25 to 30 parts in 100,000, occurs in only a few localities, and is always associated with zinc, from the ores of which it is separated by a complex and difficult process. In the metallic state I. is lustrous, white, soft—marking paper like lead—and malleable. Its specific gravity is 7·42. It fuses at 176°, and when heated sufficiently high it volatilises and burns with a blue flame. Its combining weight is 113·4; in which case the formula of the chloride of I. is $InCl_3$.

Indivis'ible, or **Pro Indivi'so Prop'erty**. *Pro indiviso* is the legal term used to denote the right to a property which belongs to several persons in common. Each *pro indiviso* proprietor has the same equal but undivided right, and is entitled to the joint use of the subject and an equal share in its produce. Mutual consent is necessary in all acts of management or disposal. Each proprietor may, however, sell his *pro indiviso* share, the purchaser coming into his place. Any of the parties may enforce by legal action, when the subject in its nature is indivisible, a sale and division of the price, and where division is possible, a division of the property. A common way in which the right arises is when a person possessed of an estate dies intestate leaving only female issue, his daughters succeed as equal *pro indiviso* proprietors to the estate.

Indo-Germanic Languages. See ARYAN LANGUAGES.

Indore', the capital of the state of the same name in Central India, separated into the old and new town by the Kutka River, 402 miles S.W. from Agra and 377 N.E. from Bombay. Pop. 15,000. There are no buildings of importance. The British cantonments are at Mhow, 13 miles S.E. In 1857 I. was the scene of a massacre of Europeans; the prince, though suspected at the time, is now known to have stood loyal.

The *state* of I., which is crossed by the Vindhya range and the Nerbudda River, has an area of about 8000 sq. miles; pop. 635,000; revenue, £500,000. The soil is fertile, and produces the well-known Malwa opium, cotton, wheat, sugar-cane, and tobacco. By the close of 1875, three-quarters of a million had been spent on the Holkar State Railway, which connects with the Great India Peninsula system, and 57 miles were open. The effective military force is 24 guns and 28,000 horse and foot. The ruler is Holkar, the third of the great Mahratta families. The first of the name was a shepherd's son, and a distinguished military chief; his descendants have suffered many vicissitudes in alliance or rivalry with Scindia and in wars with the British. The territory has generally been well administered, and the present Maharajah has a high reputation as his own finance minister. The I. Agency is the seat of a British Resident, who controls several other minor chiefs. I. was visited by the Prince of Wales in the spring of 1876. See also HOLKAR and MAHRATTAS.

Indorsed', Endorsed', Addorsed', a heraldic term applied to two animals or two Inanimate Charges (q. v.) placed *back to back*.

Indorse'ment, the writing on the back of a negotiable instrument, transferring the property therein specified; usually, however, the signature of the holder of a bill of exchange or promissory note, called, if alone, a *blank* I., but if accompanied by the name of the transferee, a *special* I. or I. *in full*. The indorser may avoid liability to suretyship by employing such restricting words as *without recourse*. In English law, the term I. is applied to anything whatever written on the back of a writ or deed. See BILL and BILL OF EXCHANGE.

In'dra (akin to Sansk. *indu*, 'drop, sap'), the *Jupiter pluvius* of the Hindu pantheon, was, according to the Vedas, the son of the common Aryan divinity Dyu (Zeus, Jupiter, Tyr), whom, indeed, he almost wholly superseded, whilst inheriting many of his attributes. It is easy to understand how in a dry climate like that of India the rain-giving qualities of the heavens should predominate over the conception of brightness which we find in the root of *divus*, and which in the moister settlements of the Aryans of the western immigration might well retain its ancient significance. I., then, is the fertilising and all-seeing sky, who pours the milk of the cloud-cows upon the earth, and in the *Rámáyana* is represented, like Argus, as having a thousand eyes and four arms, in which we see, perhaps, the four quarters of the heavens. He vanquishes with his thunderbolt the demon Vritra (*vri*, 'to hide or wrap'), the cloud which obscures the sun, the robber who confines the fruitful cows in his dark cavern-house. From this achievement I. came to be regarded as the god of victory generally, and as the special champion of the Aryans in their contest with the aborigines of the peninsula. Hence the popularity of his worship. In Vedic times I., like Zeus, was supreme, or only shared his sovereignty with Agni (fire), Surya (the sun), Ushas (the dawn), and the Maruts (winds). In the Puranas, however, he ranks only as lord of the inferior divinities, and is the object of poetic rather than of national veneration. The nature-character of the myth had faded, and I. in the later legends becomes merely a vehicle for sensuous descriptions of the charms of his paradise (*Swarga*), his nymphs (*Apsarases*), his singers (*Gandharvas*), &c. Sculptures of I. occur in the caves of Ellora and Elephanta, and representations of him are given in Moor's *Hindu Pantheon*, in which he appears seated on a three-trunked elephant, a tree growing from his head, and peacocks perching on its branches.

Indre, a central department of France, formed out of the old provinces of Berri, Orléannais, and Marche. It is bounded N. by Loir-et-Cher, E. by Cher, S. by Creuse and Haute Vienne, and W. by Vienne and Indre-et-Loire. Area, 2624 sq. miles; pop. (1872) 277,693. I. is watered by the Indre, Creuse, and Claise, is everywhere flat, and in the western district of Brenne abounds in malarious pools of stagnant water. Sheep, geese, and turkeys are largely reared, and an inferior wine produced. Iron-mining is a growing industry, and there are manufactures of paper, cotton, &c. Châteauroux (see CHÂTEAU) is the capital, and other towns are Issoudun (q. v.), Argenton, and Levroux. The Paris-à-Agen Railway traverses I.

The *river* I. rises in Cher, flows N.W. through the department to which it gives name, enters Indre-et-Loire, and joins the Loire at a point between Langeais and La Chapelle after a course of 142 miles.

Indre-et-Loire, a central department of France, formed out of the old province of Touraine. It is bounded N. by Sarthe, E. by Loir-et-Cher and Indre, S. by Vienne, and W. by Maine-et-Loire. Area, 2360 sq. miles; pop. (1872) 317,027. The chief rivers are the Loire and its navigable affluents, the Cher, Indre, and Vienne. The district in the neighbourhood of the Loire is so fertile as to have won the title of the 'Garden of France,' but agriculture is in a backward state. The northern portion is mainly heath or forest. Hemp, truffles, and fruits are largely cultivated; and the vineyards yield on an average 17,000,000 gallons of wine annually. The cloth, silk, and leather manufactures date from a period previous to the revocation of the Edict of Nantes, while iron, gunpowder, and sugar are important modern industries. I. is traversed by two main railroads and one branch line, and is connected with the Canal-du-Berry by the Cher-à-la-Loire Canal. The chief towns are Tours (the capital), Amboise, Chinon, and Loches.

Indu'ciæ Lega'les, a term of Scotch law denoting the days between the citation of a defender and the day on which he is bound to appear in the action or process. 'So many days to answer to,' is the corresponding English phrase.

Induc'tion has deen defined as the process of discovering and proving general propositions. It passes from the known to the unknown, and from the particular to the general. It is therefore distinguished from deduction, which never reaches conclusions more general than the premises from which it starts. The tacit assumption on which all I. proceeds is, of course, the invariable sequence of cause and effect. Practically, therefore, I. does not consist in saying in any particular case, 'because B has followed A in the past, B will follow A in the future.' It rather consists in ascertaining A and B. This is easy enough in many familiar cases, where the true sequence forces itself constantly into notice: *e.g.*, light and heat as effects of the sun's rays. But it is often difficult, because A is constantly combining with C and D; or, without combination of causes, the effects of C and D coincide with and obscure B; or B may be produced by E, something totally different from A; or B is constantly growing or dwindling, and cannot be fixed, even after it has disappeared. The problem of I., therefore, is to eliminate from the effect whatever may be due to antecedents other than A. If other antecedents are known to be present, and their effects are also generally known, this may or may not be easily done, according to the subject-matter of I. In chemical, biological, and sociological inquiries this might not be easy, as the behaviour of the superfluous antecedents under the particular conditions might be a question of doubt. But if it be not known what are the effects generally of all the antecedents except A, or if it be not known whether antecedents other than A are present or not, or even if they be apparently absent, the real difficulties of I. then arise. The ordinary methods of reasoning are to infer a true sequence between A and B (1) because they are found together in a number of instances; (2) because B is present in one case and absent in another, between which the only difference is the presence of A in the first case, and the absence of A in the second; (3) because the same observation as in No. 2 has been made in a number of positive instances and a number of negative instances; (4) because there is nothing but A left to account for B; (5) because whenever A increases or diminishes, B does the same. If direct experiment were possible in all cases, if the reasoner had complete control over the antecedents, and could vary them at pleasure, the process would be simpler, and would be exposed only to the very serious risks of error in adjustment and in the observation of results. But in most cases experiment is impossible, and in many cases where fresh antecedents may be introduced, or some existing ones removed at will, there is a

substantial *status quo* which makes the result very uncertain indeed. This is eminently the case with the human body. In other cases, *e.g.*, Kepler's law, and the law of refraction of light, the discovery of the true sequence is made only after an immense series of observations, and by the intervention of numerical and geometrical relations. Similarly, by the comparison of statistics extending over centuries, statists endeavour to trace the effect of a particular institution or particular physical cause. It must not be supposed that I. leads in every case to a certain result. It implies proof to a certain extent, and is therefore distinguished from unverified hypothesis or mere analogy. But it frequently affords only empirical laws, which, not themselves ultimate, probably depend on the collocation of original causes, or the derivative successions and co-existences among their separate effects. The success of I. really depends on the accuracy and range of several operations subsidiary to I., such as observation and description, abstraction, naming, and classification by natural groups or by series. This is illustrated in ethnology, where the definition of race is not yet settled. Formal logicians have endeavoured, by the use of symbols, to construct test-inductions of ideal validity. The utility of this is doubtful.

Induction of a clergyman in England, is the ceremony denoting the giving him possession of a benefice. The inductor places the hand of the clergyman on the church door, then, opening the door, puts him into the church. A bell is then tolled, which is supposed to give the parishioners notice to whom the tithes and dues are to be paid. I. in Scotland is performed by the presbytery.

Induction. See ELECTRICITY and MAGNETISM.

Indul'gence (legal Lat. *indulgentia*, 'a remission of punishment or of taxes'), in ecclesiastical writers meant (1) remission of sins, such, for example, as was held to be effected in or by baptism. But (2) it meant 'such a lightening of ecclesiastical penalties, in consideration of the state of the offender, as St. Paul practised (2 Cor. ii. 6–11). Up to the end of the 3d c. no canons for regulating Penance (q. v.), had been passed. The time required for the ordinary course of penance, in which the penitents had to pass through four stages—mourners, hearers, kneelers, co-standers—occupied a considerable number of years. The Council of Ancyra (314), however, gave the bishops power to shorten or to lengthen the period of an offender's penance; and the Council of Nice (325) gave them power to deal more gently with penitents who showed true repentance. Thus matters stood till the end of the 7th c., when the first change was effected by the Penitential of Theodore of Canterbury (668), which introduced the practice of redeeming penance at a stated and graduated rate of fines. The next step was the granting of exemption from all penance to those going on a pilgrimage or joining a crusade. One step more led to the recognised office of pardoner, the scandalous abuses of which first roused the wrath of Luther. The following is the form of the diplomas sold by Tetzel: 'May our Lord Jesus Christ have pity upon thee, A. B., and absolve thee by the merits of his most holy passion. And I, in virtue of the apostolic commission which has been committed to me, absolve thee from all ecclesiastical censures, judgments, and penalties, which thou mayest have deserved; further, from all the excesses, sins, and crimes which thou mayest have committed, however great or enormous they may be, and extending to all cases whatever, even were they reserved to our most holy father the Pope and to the Apostolic See. I wipe out all the stains of inability, and all the marks of infamy, which thou mayest in that respect have drawn upon thee. I remit for thee the pains thou mightest have had to endure in purgatory. . . . So that at the moment of thy death, the gate by which souls pass into the place of pains and torments will be shut upon thee, while, on the contrary, that which leads to the paradise of joy will be open to thee.' The doctrine of I., as now held by the Church of Rome, rests on the following grounds:—(1) That satisfaction has to be made to God for the remission of the temporal penalties for sin which remain to be paid in this world or in purgatory, over and above the eternal punishment which may be remitted on confession and contrition. (2) That the Church has always considered herself possessed of the authority to mitigate the penance which she enjoins. (3) That the sufferings of the saints in union with, and by virtue of, Christ's merits are available towards this mitigation. (4) That such mitigations, when prudently and justly granted, are conducive to the spiritual welfare of Christians.

In'dus (*Sindhu*, 'water'), a river of India, the first in length, and that with which the European world was first acquainted. It rises in Thibet, not far from the sources of the Sutlej and the Brahmaputra, under the Kailas Mountain, at a height of about 18,000 feet. It first flows N.W. through Cashmere, and then turns S. to penetrate the gorge between the Himalaya and the Hindu Koosh. It enters the plain just above Attock, where it is joined by the Cabul River from the W., at the spot where it was crossed by Alexander the Great. Here also it first becomes navigable, and thence flows nearly due S. through the Punjaub and Scinde into the Indian Ocean, which it enters near Kurachi by several mouths. Its navigable portion is 942 miles long; its total length about 1800 miles; its drainage basin about 372,700 sq. miles. About 450 miles below Attock, the I. receives on its left bank the Punjnud, which conveys the five streams that constitute the Punjaub. From the sea up to this point it is navigated by the steamers of the Indian Flotilla, in connection with the half-completed railway. The plain through which it runs would be a sandy desert if it were not watered by a network of canals. The I. basin has, in fact, been from time immemorial the home of artificial irrigation. The chief town on its banks is Hyderabad, situated just below the bifurcation of the Delta; Kurachi is a little W. of its most western mouth. Its channels are very changeable, and its diluviating action most destructive; its silt, also, is less fertilising than that of most great rivers which annually rise in flood. As is the case with the Ganges, neither its volume nor normal width increase as it approaches the sea. At present, the largest and most useful mouth is the Hajamro. Its value for trade is less than might be anticipated. The registration at Sakhar shows about 3000 tons, worth £47,000, going up stream; and 18,000 tons, worth £448,000, down stream. Apart from native craft, steamers make about fifty passages each way in the year; about £6000 is annually expended on river conservancy, and nearly as much is received in tolls. The I. Valley State Railway, which will shortly be opened from Hyderabad to Mûltan, will bring Kurachi into direct connection with the rest of India. The I. nowhere now forms the political boundary of British territory.

Indu'sial Limestone, a fresh-water limestone found in Auvergne, so named from the great numbers of indusiæ or cases of the larvæ of *Phryganea* which abound in it.

Indu'sium, a thin membrane often covering the clusters of capsules or sporangia of ferns.

Indus'trial Access'ion, a term of Scoth law, borrowed from the Roman, denoting the addition made to the value of a subject by human art or labour.

Indus'trial Schools, as recognised by the law of Great Britain, are schools specially devoted to the education of 'vagrant, destitute, and disorderly' children, and to which juvenile offenders may be sent by a magistrate. These schools are synonymous in character and purpose with the so-called Ragged Schools (q. v.); the former, however, are certified by Government, while the latter are strictly voluntary. The certified I. S., indeed, hold an intermediate position between the Ragged Schools and the Reformatory Schools (q. v.), as institutions intended to prevent the spread of crime. The previous legislation in regard to such schools was consolidated by an Act of 1866, by which the magistrate was empowered to send to a certified industrial school (1) children under fourteen found begging; (2) children under twelve charged with offences; (3) refractory children under fourteen in charge of parent; and (4) refractory children under fourteen in pauper school or workhouse. This Act was extended to Ireland in 1868. In 1875 there were 86 I. S. in England, and 28 in Scotland, attended by 11,776 children (by 8230 in England, and 3546 in Scotland). Of the schools in England, 6251 were Protestant and 1979 Roman Catholic; of those in Scotland, 3104 were Protestant and 442 Roman Catholic. As many as eight I. S. were opened in 1875, and there can be little doubt of their future increase under the present Act, supplemented as it has been by the powers given to School Boards under the Education Act not only to use such schools, but to establish them at the expense of the rates. The receipts of I. S. in 1875 amounted to £268,525; the Treasury

allowance was £136,698; subscriptions and legacies, £51,445; payment from rates—county, £14,193; borough, £14,193; profit from industrial department, £16,904; fees for voluntary inmates, £6868. The trades taught are tailoring, shoemaking, brushmaking, firewood cutting, and box-making. Frequent attempts have been made to introduce the teaching of industrial arts into ordinary elementary schools. The chief obstacle is the desire of parents to see their children receive an intellectual in preference to a manual training. In elementary schools for girls industrial work has been successfully introduced to the extent of sewing, shaping, knitting, and netting. Training schools in special departments have also been fairly successful, as in the case of the Glasnevan Agricultural Training School and of the various Training Ships. See *Reports on Certified Industrial and Reformatory Schools* (19 vols. 1856-76).

Iner'tia (Lat.) is a general property of matter, in virtue of which all bodies tend to preserve their state of motion or rest. It expresses the fact that matter itself is *inert*, and changes its condition only when acted upon by external agencies.

Inescut'cheon, in heraldry, a small shield, in the fesse point. When there are more than one small shield, they are called escutcheons.

Infallibil'ity of the Church is divided into *passive* and *active*. By passive I. or Inerrancy, is meant that 'the Church must always have a tenure of truth sufficient for salvation,' and that any doctrine which can be said by its universal acceptance to be the deliberate ascertained voice of the Church, must be from God. In support of which doctrine are cited such promises as John xvi. 13; 1 John ii. 27, and the declaration that the spirit which dwells in the Church is a spirit of knowledge and understanding (Col. i. 9, ii. 3, iii. 10). This theory, which is held more or less by all Episcopal Churches, is very different from the doctrine of I. held by the Church of Rome: namely, that 'the Church is divinely appointed to be the infallible teacher of men in all things pertaining to faith and practice;' in other words, that she can never possibly teach anything erroneous. But there is a controversy in the Church of Rome itself—between the Gallican and the Ultramontane party—as to the organ of the Church in its I. According to the former, the bishops, as the official successors of the apostles, and in their collective capacity, are infallible as teachers; according to the latter, the Pope, who is the Vicar of Christ, and is not subject to a general council, is the organ through which the infallible teaching of the Church is given, his I. not being personal, however, so as to depend on his personal character, but official, so that he is the organ of the Holy Spirit when speaking *ex cathedra*. The theory of Papal I. was sanctioned in the Œcumenical Council of 1870, and is therefore now the faith of the Church.

Infamed', or **Defamed'**, a term in heraldry used to denote that an animal has lost its tail, and is thus 'defamed' or disgraced.

In'famous. A person is legally I. who has been convicted of crime, or whose generally bad reputation can be proved by questions put to himself. Formerly in the United Kingdom infamy of a witness was valid ground on which to reject his testimony. It is now taken for what it may be worth.

Infant, in law. See AGE.

Infan'te (Lat. *infans*, 'an infant'), the title of the younger sons of the Kings of Spain and Portugal, the heir-apparent being styled in the former country Prince of the Asturias, or simply the Prince, and in the latter Prince of Beira, or (till 1825) of Brazil. The younger princesses of the royal house are similarly called *infantas*. I. is an ancient title, occurring in a document of the year 999, but was originally applied to all hidalgos. The *infantado*, or appanage of an I. or infanta, gave name to a district of four villages in the province of Guadalajara, which was erected into a dukedom in 1476.

Infan'ticide may be regarded as an archaic institution or as a modern crime. The systematic exposure of children which took place at Sparta, and still disgraces China, was dictated in the one case by political, in the other by economical, reasons. The advantages of weeding from a community its weaker or its superfluous members were clearly pointed out by Plato in his *Republic*. Not merely is a burden removed from the survivors, but the reproduction of feeble and diseased human beings is prevented. The disadvantage would consist in the starvation of the finer sympathies and educated conscience of society. It must, however, be kept in view, that in primitive times the conditions were often very different. Not only was there less realised wealth on which superfluous persons might exist, but there were fewer employments in which the weak or the deformed might gain a livelihood. There are various forms of I., extending to the children of concubines, of stranger fathers, and of mothers who die from sickness. The Beloochis use opium and drowning in milk: hence the proverb, 'The lady's daughter died drinking milk.' In general the practice is confined to female children, as being more dependent on others, especially in a warlike tribe. This is probably due also in some measure to the old practice of exogamy, which compelled the men of the tribe to seek a wife outside its ranks. Among some of the hill tribes of India female children are placed at the door of the cattle pen so as to be trampled to death by the buffaloes. According to the statement of an old member of a Toda tribe (who seem to be otherwise affectionate to their children) it was only on account of extreme poverty (each family having only one *putkuli* or mantle) that they smothered and buried all girls *after the first*. The I. of male children is very rare, and is generally based on religious considerations. Certain children of the Khond tribes, *e.g.*, are set apart by the priests for sacrifice. I., as a branch of human sacrifice, was of course extensively practised under the Phœnician and other extinct civilisations. But among certain African races children are selected as sacrifices for sacrilege, or where, as on the death of a chief, the killing of lower animals is not thought sufficient. I. is also caused by special superstitions, as in Bambarra, where if a male child of one of the king's wives is born on a Friday its throat is at once cut. In Mexico children of noble birth were regularly sacrificed to the god of rain. In Central America bastard children were occasionally killed in the temples, and their blood used in the making of a sort of sacred wafer; and another class of boys, named Mojas, were specially preserved for sacrifice to the sun.

In modern times I. is a well-known crime, following generally on illicit intercourse. The killing of lawful children is rare. The motive of shame also leads to the kindred crimes of criminal abortion and concealment of pregnancy. Compassion for these unhappy mothers led in 1809 to a statute which introduced to Scotland the last-named offence. Formerly, as in England, the charge was murder, and it was often difficult to prove complete birth. It was suggested in 1866 that the killing of a child during birth, or within seven days thereafter, should in England be made an offence punishable with penal servitude or imprisonment. This has not been done, and the common law is therefore forced to assume (in deference to public opinion) that every new-born child has been born dead, until the contrary appears from evidence in court. Such cases generally result in verdicts of culpable homicide. The crucial tests of life in a child seem to be the colour, volume, consistency, absolute weight, and buoyancy of the lungs; but a child may be born alive, and therefore murdered, before it has breathed. The hydrostatic test, or watching whether the lungs sink or swim in water, only goes to the fact of breathing. Respiration, however, may be simulated by artificial inflation, and may also occur *before* and not *after* birth. The common modes of I. are suffocation, drowning, and exposure. It must be recollected that the *natural* causes of death in new-born children are numerous.

Infants, Liabilities of. Under the age of seven an infant cannot be capitally punished, but at fourteen he may. Regarding the liabilities of an infant between seven and fourteen there is great uncertainty; for it depends on the capacity to distinguish between the good and evil tendency of actions. Sir M. Hale mentions the capital conviction of a girl of thirteen, who was burned for killing her mistress. A boy still younger, he tells us, was hanged for killing his companion, on the ground of his having hid himself, and that the hiding showed that he knew he had done wrong; the maxim of the law being—*malice is equivalent to age*. See AGE, and articles there referred to; also GUARDIAN.

Infant Life Protection Act, 1872. This important statute was passed for the better protection of infants intrusted to persons to be nursed or maintained for hire or reward; but

it does not extend over the relatives or guardians of an infant, nor over persons receiving one under the Poor Law Acts. Houses are to be registered with the local authority, who is to make byelaws regulating the number of infants to be received in each registered house. In non-registered houses, only one infant is to be kept for hire, or two may be kept if twins. Notice of death must be given to the Crown within twenty-four hours after the event.

Infanticide, Law Regarding. See BIRTH, CONCEALMENT OF; PREGNANCY, CONCEALMENT OF.

In'fantry (Lat. *infans*, 'child,' or 'servant,' first applied to servants on foot, and then to foot-soldiers—*infanteria*), the foot-soldiers of an army, as distinguished from the cavalry and artillery. I. formed the chief strength of the Greek and Roman armies, and after falling into insignificance during the middle ages, when battles were mainly decided by heavy cavalry, began to rise in importance from the end of the 14th c., and now forms the chief body of an army.

Infec'tion denotes a specific virus generated in diseased persons, and capable of reproducing itself when implanted in the system of otherwise healthy persons; but in this acceptation it is more properly termed *infective matter*. I. also signifies the *communication* of such specific virus from a diseased to a healthy person. I. and Contagion (q. v.) are used as synonymous in a great majority of cases.

Infec'tious Diseas'es are those maladies which are capable of being communicated from one person to another, and the class comprehends nearly the entire miasmatic order of zymotic disease, such as smallpox, vaccinia, chicken-pox, measles, scarlet fever, rubeola, dengue, erysipelas, plague, enteric fever, typhus fever, yellow fever, hooping-cough, diphtheria, croup, cholera, syphilis, and gonorrhœa; and also certain diseases communicable from the lower animals to man; such as cowpox, hydrophobia, glanders, and farcy, and malignant pustule (q. v.). I. D. include also transmissible parasitic diseases—the entozoa, the epizoa, and the epiphytes, such as tapeworms, fluke-like parasites, round worms, lousiness, itch, ringworm, scald-head or favus, tinea decalvans, and fungus-foot of India (q. v.). Various attempts have been made by special enactments, such as quarantine regulations and Public Health Acts, to limit the ravages of I. D.; but as yet no such comprehensive measure has been adopted for the protection of healthy men as has been enforced for the protection of healthy cattle, and the more important clauses in the Public Health Acts are permissive in their character, and, consequently, generally ignored.

Infeft'ment, a term of Scotch law denoting the giving of symbolical possession of heritable (real) property; the legal evidence of which is an Instrument of Sasine (q. v.).

In'finite, in mathematics, is applied to a quantity which is greater or smaller than any assignable quantity, however great or however small that quantity may be. An infinitely small quantity is not strictly nothing, but it is so small that it makes no appreciable difference when added to or subtracted from an ordinary conceivable quantity, and that further its square may be neglected in comparison to itself. As an example of an infinitely great quantity the sum of the natural numbers to infinity may be given. By taking a sufficient number of terms, the sum can be made greater than any assignable quantity, and this is all that is mathematically meant when we say that $1 + 2 + 3 + 4 + \dots$ to infinity is infinity.

In metaphysics the term I. has no universally accepted meaning. The best thinkers, however, maintain that it denotes nothing positive, but is only an expression of our inability to transcend in conception the limits of matter and space.

Infin'itive. See VERB.

Inflamma'tion is the reaction of a living tissue against an injury, and the term comprehends 'an assemblage of phenomena held in relation with each other by the circumstance that they are all effects of the same injurious agency, and that they all form parts of one process, of which the various stages follow each other in more or less orderly succession.' These phenomena, the result of mechanical or chemical injury, depend on changes in the structural elements of the tissues, and they may have their seat also in the blood-vessels themselves, as muscular tubes (the contractile elements of which are under the immediate control of the vaso-motor nervous system), or as mere conduits for the conveyance and distribution of the blood. I., therefore, consists of textural and vascular changes, but the former are subordinate and consequent to the latter; for although a living part cannot be injured without the elements of its tissues undergoing germinative changes, such changes, resulting in the production and multiplication of young cells, are never the first effects of which the reaction of a living tissue against an injury consists. The first local effect is vascular, and the state of contraction of the smallest arteries within and around the seat of the injury is altered or modified so as to determine an increased supply of blood to the injured part, and the walls of the capillaries undergo changes in consequence of which the liquor sanguinis and corpuscles ooze out into the lymphatic spaces containing the elements of the tissues. In consequence of this exudation the tissue elements begin to germinate, but the tissue may be acted on directly by the peculiar cause of the I., or indirectly by the exuded liquor sanguinis with which it is irrigated, and it is probable that in the majority of inflammations the excitation of the tissues is indirect or secondary, being due to the exuded liquor sanguinis. Textural germination may occur as the direct result of mechanical or chemical injury, without any antecedent inflammation; but such results, if they ever take place, are, at all events, exceptional. I., if of considerable extent, is invariably attended with more or less fever, limited in duration and degree by the limits of the injury which caused it, and is designated as *simple* or *normal* I.; but when the I. extends beyond the direct and primary operation of its cause, inducing similar inflammations in other parts, and disordering the vital functions of the whole body, inducing those states expressed by such terms as *irritative fever*, *pyæmia*, or *septicæmia*, the I. may be appropriately termed *infective*. Infective I. is characterised by peculiar appearances at the original seat of I., and by the appearance of new foci of I. along the course of the infected channels, and in the occurrence of changes in the physical and organoleptic characters of the blood itself, indicating that it is impregnated with the infective poison. It has been discovered that in all acute infective inflammations microzymes abound in the exudation-liquids, and that the same forms are also to be found in the blood of the infected animals, their presence being a constant accompaniment of all acute infective suppurations. These organisms, permeating the exudation liquids, are various, and have characteristic appearances to which distinctive terms are applied, but they may be divided into two groups, according to the circumstances under which they occur. Of these groups, the *rod form* is the type of one, and the *dumb-bell form* of another. Where the development of microzymes is going on with great rapidity, as in the exudation-liquid of intense infective-peritonitis, single *rod-forms*, not larger than $\frac{1}{1000}$ millimetre in length, are found, and the less acute the process of I. may be, the larger are the *rods*, and the more symmetrical is their arrangement of filaments, end to end. In the exudation liquids of a subcutaneous abscess, or of a chronic peritonitis, there are scarcely any *rod-forms*, the prevalent *forms* being *spheroids*, *dumb-bells*, and *chains*. On no single occasion has any form of mycelium been discovered in infective liquids charged with microzymes, and the microzymes of ordinary drinking water neither originate from fungi nor develop to them. In the various forms of secondary I. the exudation liquids of ordinary I. are always endowed with toxical properties not possessed by other animal fluids, and which produce local I. in the living tissues with which such liquids are brought into contact; or acute general disorder, consequent on their existence in the circulation or in the tissues. It has also been demonstrated that in the transmission of infective I. by inoculation, an *augmentation of infective activity* takes place of such a nature that, from an inconsiderable and transitory product at first, a product is eventually obtained possessing toxical powers of the most intense virulence. The presence of characteristic organic forms in infective exudations, affords *in itself* no conclusive proof that these bodies are the cause of the infectiveness; but as these infinitely minute organisms are present in every intensely infective inflammation, we may conclude that they have an important relation to the morbid process.

Nearly all the tissues and organs of the body may be the seat of I., so that the various diseases resulting from I. are numerous and complicated, and the more important are described under their specific names, which, as a general rule, terminate in the

affix *itis*, denoting I. I. of the lungs, however, is usually designated pneumonia, instead of pneumonitis. See the experimental researches of Hunter, Thomson, Wilson, Philips, Hughes, Bennett, Wharton Jones, John Simon, Paget, Lister, and the recent investigations of Dr. Burdon Sanderson, *Reports of an Experimental Study of Inflammations*, contained in the *Reports of the Medical Officer of the Privy Council and Local Government Board* (new series, No. vi. 1875).

Inflec'tion is the general term employed by grammarians to denote the changes which words undergo when placed in relation to one another in a clause or sentence. Most of these changes take place in the terminations of words, and these have been proved by philologists to represent separate words joined to the stem or root. In course of time these suffixes became merged in the root-word itself, and gave rise to case, number, person, tense, mood, and voice. In the Indo-European tongues, there can be no doubt that the terminations of the persons in the different tenses of verbs are personal suffixes, or pronominal forms disguised by time, or by that constant change which is the universal law of language. The most common forms of the personal suffixes are—sing. *mi, si, ti*, representing respectively the pronouns *ma, twa* (*swa*), *ta*. The plural forms *mas, tas, nti*, are more obscure. The most ingenious explanation yet offered makes *mas* = *ma* + *twa*, *i.e.*, 'I and thou,' 'we;' *matwa* would become *matwi, masi, mas*. So *twatwa*, 'thou and thou,' 'ye,' would become *twatwi, twasi, tas*. The third form, which differs from the singular only by the insertion of *n* before *ti*, has not yet been satisfactorily accounted for. The Latin differs but little from the Sanskrit in these forms, *e.g.*, *su-m, es, es-t, su-mus, es-tis, su-nt*. The verb was further inflected so as to express different times of action, and this by a process quite distinct from the combination of a nominal or verbal base with a pronominal suffix. In the Latin verb, for example, the terminations in *bam, bo, avi*, &c., are made up of already inflected forms, from *i*, to go, and *as* and *fu*, to be; thus *amabo* = *amare-fuo*, 'I am to love.' Many philologists, however, consider *bo* and *bam* to be divergent forms of the root *bhu*, 'to be,' in which case *bo* and *bam* would be added to the root *ama*. That auxiliary verbs do in some languages do duty as inflections is shown by the French future *aimer-ai*, 'I have to love.' Other modes of I. are by prefixes known as *augment* and *reduplication*, *e.g.*, Gr. *tuptō*, imperfect, *e-tupton*, perfect, *te-tupha*; Lat. *tundo*, perfect, *tu-tudi*. Thus far we have spoken of I. only with regard to person, number, and tense. The various moods and voices of verbs were in like manner distinguished by suffixes, but whether these are pronominal or verbal is not clear. It remains to say a few words on the I. of nouns and adjectives. The nominative case (denoting the subject) ended in *s* in masculine, sometimes also in feminine, nouns, as—Gr. *hippo-s*, Lat. *equu-s, nube-s, Gaiu-s*. In all such cases *s* is most likely the pronoun of the third person 'he' or 'she,' for gender is no natural distinction in language. The accusative (denoting the object) was usually marked by the suffix *m*. The locative case, distinguished by the suffix *i*, originally denoted *in a place*; the dative, with suffix *ai*, probably a modification of the locative, expressed *bodily inclination towards an object*. The ablative, with a variety of suffixes, in its primary signification denoted *from a place*; while what is commonly called the instrumental case, with the two suffixes *ā* and *bhi*, possessed a meaning much less definite. In Sanskrit the *ā* form is very common; it is found in Greek in words like *hama, tacha*, &c. In Latin the *bhi* form is seen in *tibi, sibi, ibi, ubi*; in epic Greek in *biē-phi*, 'with strength.' In modern languages the work of I. is performed in great measure by articles, prepositions, pronouns, and auxiliary verbs. From those modern tongues in which it does exist, I. is rapidly disappearing. In French, for instance, though it remains in the verb in the written tongue, it has almost vanished from the spoken language. The loss of I. in modern tongues can hardly be looked upon as a misfortune, for if it has robbed them of the simplicity and elasticity of earlier forms of speech, it has invested them with a clearness, a directness, and a precision peculiarly their own. See Peile's *Philology* (Lond. 1877).

Inflores'cence (Lat. *in*, and *florescere*, 'to begin to blossom') is the manner in which flowers are arranged, and the form of I. not only determines the habit of a plant, but is also of value in its systematic classification. It is (1) *terminal* or *determinate* when at the summit of a stem or leafy branch; (2) *auxiliary* or *indeterminate* when arising in the axil of a Bract (q. v.), the stem or branch ending in leaf-buds. The former (1) is nearly always *centrifugal*, *i.e.*, the terminal or the central flower opens first, and the others downwards or outwards in regular progression; the latter (2) is always *centripetal*, *i.e.*, the lowest or outermost first open. To the main axis of the I. the term *rachis* is applied; the stalk supporting a cluster of flowers (sometimes a single flower) is a *peduncle*; and if single-flowered branches are given off by a peduncle, they are termed *pedicels*; a leafless peduncle arising as if from the root is a *scape*. Flowers that are not stalked are *sessile*. The principal forms of I. are—*Spike*, a simple (*i.e.*, undivided) axis with sessile flowers; *raceme*, a simple axis with stalked flowers; *panicle*, a raceme with branched peduncles; *corymb*, a raceme with the peduncles becoming gradually shorter as they approach the top, so that all the flowers are about on a level; *umbel*, when many stalked flowers spring from one point, and reach about the same level; *partial* umbels are umbels seated on the branches of an umbel, when the whole forms a *compound* umbel; *head* or *capitulum*, when several sessile or nearly sessile flowers are collected into a compact head-like cluster; *cyme*, formed of a terminal flower, beneath which are branches each having a terminal flower, together with lateral branches again similarly dividing, and so on; a *globose* cyme has flowers so placed as to form a globose mass; a *scorpioid* cyme produces only the external branch of each pair except the first. *Catkins* are deciduous unisexual *spikes* of crowded flowers, and the *spadices* of various monocotyledons and the *ears* and *spikelets* of grasses are forms of the spike. Different forms of I. may arise from varied combinations of some two of the above primary forms.

Influen'za is a specific febrile disease of the miasmatic order of zymotic disease, frequently prevailing as an epidemic, and attended with an extreme degree of lassitude and prostration. The most prominent symptoms of I. are chills and great sensibility to cold over the surface of the body. The mucous membranes lining the air passages are chiefly affected, the nostrils discharging an acrid fluid, accompanied with coughing and a yellowish expectoration, which is most troublesome at night. The eyes are injected and watery, and there is intense frontal headache, especially over the eyes, sometimes attended with giddiness, delirium, or lethargy and excessive insomnia. The fever attending I. is sometimes very severe, and the type varies in different epidemics and localities. The sense of taste is generally disordered, and there is great oppression over the region of the heart. In 1311 and 1403 I. was very fatal in France, and in the year 1557 it prevailed as an epidemic over the whole of the northern hemisphere, beginning in Asia and terminating in America. I. was epidemic in the years 1729, 1743, 1775, 1782, and in 1831, 1833, 1837, 1847, and prevailed in both summer and winter, lasting nearly the same time, from four to six weeks, in the different towns and cities attacked. The specific poison of I. probably affects animals as well as man, for when I. has prevailed as an epidemic, a similar disease has been epizoötic among horses and dogs, as in the years 1728, 1732, 1775. I. is endemic in the tropics, at least in Eastern Africa, and is frequently confounded with ague, which, in some respects, it closely resembles. In this country the type of the fever is remittent, with exacerbations in the evening, generally terminating in abundant perspiration after a duration of from two to four days; but in Germany the fever is sometimes intermittent. The more severe cases are followed by serous inflammation and red hepatisation of the lungs, terminating fatally. The nature of the epidemic influence which gives rise to I. is unknown, but sudden changes of temperature assist in the development of the poison, and exposure to cold predisposes to the disease. The chief indications in the treatment of I. are to relieve the bowels by an active cathartic, to promote perspiration by warmth, and to counteract the febrile symptoms by the administration of quinine in full doses. Pulmonary complications are to be treated on the same principles as special diseases of the pulmonary tissues.

In For'ma Pau'peris, a term used to denote that a person is allowed to sue 'as a pauper'—that is, without payment of court fees and other costs.

Informa'tion by the Crown, is a term of English law denoting a mode of carrying on a criminal process without the

intervention of a grand jury. Information in name of the Queen is filed *ex officio* by the Attorney-General, and is only directed against an offender, to delay punishing whom might be dangerous to the state or to the public peace.

Infor'mer. In English law various statutes enact penalties for offences, and award part, or the whole, to the person whose information has led to the conviction of the offender. In such cases, it is usually provided that any one may prosecute. He who does so is called the I. Any one informing and compromising with the accused is by statute disabled from again suing as an I. Public prosecutors in Scotland are bound to give the name of their I., who is liable in damage if the information be false, the falsehood being aggravated if malicious.

Infundibula'ta, the name given to one of the divisions of the class *Polyzoa* (q. v.), distinguished by having the tentacles arranged in a round or orbicular fashion, and by the absence of an *epistome* or valvular lid for closing the mouth of the cells. The sea-mats or *flustræ* exemplify this group.

Infu'sions, or **Infu'sa,** are aqueous solutions of vegetable substances, generally prepared with boiling water, but, in some cases, made at a lower temperature—as *infusum calumbæ*—to prevent the starch-matter from being dissolved. Concentrated I. are very largely used; but, though convenient and economical, they have not the aroma of the freshly-made infusion. To obviate putrefactive changes, small bottles, filled to the brim with recently-made infusion, are placed in a boiler with hay and water, and kept at the boiling-point for five minutes, and are then tied over with a bladder, and stoppered while hot. I. thus treated may be preserved good for several weeks. I. prepared by Percolation (q. v.) are less liable to decay than by the ordinary method of infusion.

Infuso'ria, the name given to the highest class of the *Protozoa* (q. v.). This group of animalcules is defined by having a *mouth*, by the general presence of *Cilia* (q. v.), and by the inability to protrude the body into *pseudopodia* or prehensile processes. The body, as in all protozoa, is composed of *Protoplasm* (q. v.), and the body-substance exhibits a division into three layers, the outer being named the *cuticle*, the middle the *cortical layer*, and the innermost layer the *chyme mass*. These animalcules are for the most part of microscopic size; the smallest existing as mere specks under the highest powers of the best microscopes. Under the general name of I., a great variety of very dissimilar beings were included by the older naturalists. Thus *Diatomaceæ* (now regarded as low vegetable organisms), the *Rotifera*, or 'wheel animalcules,' and many others, were formerly included under this name; the more perfect investigation of their structure, however, resulting in their being separated from the present class, and allocated to different groups of the animal or plant worlds. The great majority of infusorians are free-swimming animalcules, some, as the *Vorticellæ* or 'bell animalcules,' being borne on a contractile stalk; while others, as *Epistylis*, are branched but not contractile; *Carchesium* being both branched and contractile. *Stentor*, or the 'trumpet animalcule,' a common denizen of our pools, can attach itself at will to fixed objects, swimming freely at other times by means of the *cilia*, which constitute the locomotive organs of the class. The mouth exists as a small orifice surrounded by cilia, which sweep particles of nutriment into the orifice. These particles pass into the general substance of the body, and are digested by the surrounding protoplasm. Ehrenberg, who was one of the first to investigate the structure of these animalcules, supposed that each food particle was lodged in a distinct stomach. This observation was founded on an error, and hence Ehrenberg's name of *Polygastrica* ('many-stomached'), applied to the I., has passed from the vocabulary of the zoologist. Certain clear spaces, named *contractile vesicles*, are seen to expand and contract with a regular and rhythmical motion in the bodies of I. It has been supposed that these bodies represent rudimentary hearts. Reproduction in I. takes place by *fission* or simple division of the body substance into two or more new animalcules; by *gemmation* or budding; and by *encystation*, this latter being a process consisting of the division of the body-substance into small portions, each of which, when liberated, becomes a perfect animalcule. The *nucleus* and *nucleolus* seen within the bodies of many I. are believed to represent reproductive organs, and hence these bodies are supposed to possess intimate relations with the process last alluded to. The *classification* of the I. is still under the consideration of zoologists. The system most commoly received is that wherein the class is divided into three orders: (1) *Ciliata*, which includes the great majority of these animalcules, in which the body-surface is more or less completely provided with *cilia*; *e.g.*, *Vorticella*, *Epistylis*, *Paramæcium*, *Stentor*, &c.; (2) *Flagellata*, including those forms in which the *cilia* are reduced to one or two in number; *e.g.*, *Peranema* and *Anisonema*; (3) *Suctoria*, so called from the fact that the body has tubular filaments provided with suckers at their tips. Whether or not the suctorial I.—represented by *Acineta*—are distinct and separate I., or are merely stages in the development of other forms, are facts which have not exactly been determined.

The name I. is derived from the Latin *infusum*, an infusion, and is applied to these creatures from the fact that they are usually found wherever collections of animal or vegetable matter are exposed to the atmosphere. Hence the I. have become of special interest to biologists as beings which, according to one school of thought, may be produced by *spontaneous generation* or *abiogenesis*, *i.e.*, without the presence of parent-germs or organisms. The 'germ-theory,' on the other hand, which holds that the germs of these and allied organisms are carried by the atmosphere, and develop into mature forms when surrounded by proper conditions, is a thoroughly logical hypothesis, and accounts in a perfectly natural manner for their appearance in infusions. (See GENERATION, SPONTANEOUS.) The name *Fossil I.* has been erroneously applied to the fossilised flinty shells of minute animals known as *Polycystinæ*, which are allied to the *Foraminifera*.

In'gelow, Jean, an English poet and novelist, was born in Boston, Lincolnshire, about 1830. She published *Tales of Orris* in 1860. A collection of *Poems* which appeared in 1863, containing *Divided*, *Songs of Seven*, *The Letter L Divided*, *The High Tide*, &c., established her fame, and has passed through many editions. Her subsequent works include *A Story of Doom and other Poems* (1867), *Mopsa the Fairy* (1869), *Little Wonder Horn* (1872), and *Off the Skelligs* (a novel in 4 vols. 1873). Her poems are remarkable for depth of feeling and high artistic power, and her tales for children are charming.

Ing'emann, Bernhard Severin, a great Danish poet and novelist, was born May 28, 1789, at Torkildstrup, in the island of Falster, and educated at Copenhagen University. While yet a student, he published in 1811 a volume of poems, and after a tour (1818–19) in Germany, France, Switzerland, and Italy, became (in 1822) 'Lector' in Danish language and literature at Sorö Academy, of which institution he had the general direction from 1843 to its dissolution in 1849. He died 24th February 1862. I. was a writer of great fertility in various fields. He himself divided his literary life into three periods—the first (1811-14) romantic, subjective, sentimental, and devoted to poetry; the second objective, and given to the drama; and the third (from 1821) to poems and to historical novels illustrative of the middle ages in Denmark. These are excellent imitations of Scott, and in great favour with the people. His chief works are an epic poem, *Valdemar den Store og hans Mænd* (1824), his masterpiece; the novels *Valdemar Seier* (1826); *Erik Menveds Barndom* (1828); *Kong Erik og de Fredlöse* (1833); *Prinds Otto af Danmark* (1835); the dramatic poem *Renegaten* (1838), and tale, *Salomons Ring* (1839); and the poems *Dronning Margrete* (1836), and *Holger Danske* (1827). *Kunnuk og Naja* (1842), a tale of Greenland life; *Landsbybörnene* (1852), a romance; *Confirmationsgave* (1854), and the poems *Tankebreve fra en Afdöd* (1855), and *Guldæblet* (1856), may be also mentioned. His *Samlede Skrifter* are published in four sets. *Dramatiske Digte* (6 vols. Copenh. 1843); *Historiske Digte og Romaner* (12 vols. 1847–51); *Eventyr og Fortællinger* (12 vols. 1847–56); *Romaner, Sange, og Eventyrdigte* (9 vols. 1845–64). *Levnetsbog*, an autobiography of I., appeared at Copenhagen in 1862.

Inglis, The Right Hon. John, an eminent Scottish lawyer, son of the Rev. Dr. Inglis, a minister of the Established Church, was born in 1810, and studied at Glasgow and Oxford. He was called to the Scotch bar in 1835, was made Solicitor-General for Scotland in 1852, and shortly afterwards became Lord Advocate. He was appointed Lord Justice-Clerk of Scotland in 1858, and in the same year was returned for Stamford. In 1859 he was made D.C.L. and a member of the Privy Council.

He was appointed Lord Justice-General and President of the Court of Session in 1867, and Chancellor of Edinburgh University in 1869. I. is one of the keenest, strongest, and most legal intellects adorning the Scotch Bench.

In'golstadt, originally called **Ingoldestadt,** a Bavarian city defended by fortifications of imposing strength, is situated at the confluence of the Schutter with the Danube, 50 miles N. of Munich by rail. It possesses a castle, convent, nunnery, and three churches, one of which is for Protestants, and another is the colossal church of the Virgin (*Liebfrauenkirche*), built early in the 15th c., where lie the bones of Eck, Luther's antagonist. I. was fortified in 1250, and for more than 300 years was the seat of a university, founded in 1472, transferred to Landshut in 1800, and finally incorporated in 1826 with the University of Munich. By the Latin writers of the 16th c. I. was called *Auripolis* and *Chrysopolis* ('Golden City'). It has no manufactures of any importance, and depends chiefly on the agricultural industry of the neighbourhood. Pop. (1871) 13,157.

In'gres, Jean Dominique Auguste, a French painter, was born at Montauban, September 15, 1781. He studied in the *atélier* of David, and in 1801 gained the first prize of the École des Beaux Arts. In 1804 he painted a portrait of the First Consul, which so pleased Napoleon that he gave I. a sitting for a second, which appeared in 1806. He studied in Rome (1806-20) and in Florence (1820-24), during which time he produced many large classical, historical, and religious pictures, such as 'Œdipe expliquant l'Enigme,' 'L'Entrée de Charles V. à Paris,' &c. In 1825 he was elected a member of the Institute, and Professor in the École des Beaux Arts. 'L'Apothéose d'Homère,' one of his finest efforts, was painted for the Louvre in 1827. In 1829 he became Director of the French Academy at Rome, and while there he painted 'Le Martyre de St. Symphonea,' 'Stratonice,' and a portrait of 'Cherubini.' On his return to France some ten years later, every possible honour was showered upon him by the state. A special room was set apart in the Paris Exposition Universelle of 1855 for forty of his pictures. He exhibited 'La Source,' one of his best pictures, when eighty years of age. He was named a Senator in 1862, and died January 14, 1867. I. has been almost idolised by his countrymen, though no artist has been subjected to more searching criticism. His style is founded on that of David, tempered by a study of the great Italian masters, particularly of Raphael. His merits are originality in conception, wondrous grace of outline, and conscientiousness in labour; his defects, a certain hardness in drawing and unreality in colour. He has exercised enormous influence over modern art in France. Over a hundred engravings of his works were published by Mons. A. Reveil in 1851.

Ingross'ing or **Engross'ing** a deed, means the making a fair copy from the draft for signature. The corresponding term of Scotch law is 'extending a deed.' See TESTING CLAUSE. English law, ATTESTATION.

Ingulf, Abbot of Crowland, was, until Sir Francis Palgrave led important evidence in 1826 to prove the contrary, generally believed to be the author of the *History of Crowland* (*Historia Monasterii Croylandensis*). More recently (1870) Mr. Freeman has decided that 'it is quite certain he did not write the book which is called by his name;' the same historian concluding that 'it must have been written several hundred years later.' I., according to the *Historia*, was born in London (1030), educated at Westminster and Oxford, became secretary to William, Duke of Normandy, undertook a pilgrimage to the Holy Land along with Sigfrid, Duke of Mainz, passed through many vicissitudes in the East, returned to Normandy, became a monk in the Abbey of Fontenelle, from which he was advanced to the office of prior. In 1076, through William the Conqueror's influence, he was transferred to the Abbey of Crowland in Lincolnshire, whose history he was understood to have continued from 664 till 1091. I. died of gout (1109). Three editions of the works attributed to him have been published; by Savile (1596), Gale (1684), and Bohn in his *Antiquarian Library*.

Inher'itance. See HEIR AT LAW, HEIR PRESUMPTIVE.

Inhibi'tion is a process of Scotch law by which a debtor, having heritable (real) estate, is prohibited from alienating or burdening it, until the debt due to the inhibiting creditor is provided for.

Inhib'itory Action, this is a term applied by modern physiologists to designate a peculiar action of the nervous system by which one nervous centre or set of nerve-fibres can restrain or moderate the action of another. The most notable example is the influence of the pneumogastric or vagus nerve on the action of the heart. When this nerve is cut the heart beats faster, and when the end of the nerve next the heart is stimulated by electric currents, the heart beats more slowly, and if the stimulus be sufficiently powerful, the heart will stop beating in a condition of complete relaxation. It is well known that the heart has in its own substance ganglia or knots of nervous matter which regulate its rhythmic movements. These ganglia may apparently be restrained in their action by this nerve; but the exact way in which this is accomplished is quite unknown. I. A. plays an important part in all nervous mechanisms, and in all probability the influence of the will may be accounted for by supposing that certain higher centres in the brain have no power of governing or controlling lower centres.

In'ia, a peculiar genus of *Cetacea* (q. v.), or whale-like mammalia, found inhabiting the rivers of Bolivia, often at a distance of over 2000 miles from the sea. The average length of the males is about 12 or 14 feet; of the females, 7 feet. The only species is the *I. Boliviensis*. These mammals agree with the dolphins and their neighbours in essential structure, and are included in the family *Delphinidæ*. The head is somewhat pointed; and the colour is black above, and white on the under parts.

Injec'tions are fluid medicines thrown into the passages or cavities of the body by means of a syringe or elastic bag. Fluids injected into the rectum are termed Clysters (q. v.). Medicines are occasionally administered by injecting under the skin, called hypodermic medication, to produce local, and sometimes constitutional effects. Blood is also occasionally injected into the veins in cases of severe and sudden hæmorrhage. See TRANSFUSION OF BLOOD.

Injunc'tion is a writ in English law to prevent or stop the procedure of an illegal or inequitable act. Disregard of I. renders the offender liable to punishment for contempt of court. The similar process in Scotland is called *Interdict*.

Ink (Fr. *encre*; Ital. *enchiostro*; Lat. *encaustum*, the purple red ink used only in the signature of the Emperors) is the coloured fluid used for forming written characters, and the viscous material employed for printing impressions from types, plates, or lithographic stone, &c. The two classes of materials thus indicated are essentially different from each other, and will be separately noticed. *Writing-inks* are of many colours, and prepared from numerous tinctorial substances. The essential qualities of a good I. are, that it should flow freely from the pen, which it should not corrode or destroy; that it should not turn mouldy or thicken on exposure; that it should so bite into the paper as not be washed out; and, finally, that it should not fade or disappear with age or exposure. Ordinary *black I.* is a solution of a compound tanno-gallate of iron held in suspension by the addition of gum arabic or a similar compound. The following recipe yields an excellent black I:—Of the best blue Aleppo galls, well bruised, 4 oz. are macerated for a fortnight in a quart of distilled water. To this are added 1½ oz. of gum arabic dissolved in water, and ½ oz. of lump sugar. When well mixed, 1½ oz. of crushed green copperas (ferric sulphate) is added, and the whole is then occasionally shaken up for two or three days. After a week or two the I. is ready for use, and to prevent mouldiness, a drop or two of carbolic acid, or a little essential oil, may be added. *Copying-I.* may be made by adding sugar to ordinary black I.; but the best copying I. is made from roasted galls, by which a portion of pyro-gallic acid is formed, a substance much more soluble in water than ordinary gallic acid. *Red I.* of the finest quality is made from cochineal with liquor of ammonia, but Brazil-wood with acetic acid, garancine, and other red dyes are also employed. *Blue I.* is prepared by dissolving Prussian blue in oxalic acid, and by various other agents. *Purple I.* and *violet I.* are made from a strong decoction of logwood, to which a little alum and tin crystals are added, and I. of almost any colour can be obtained by similarly treating the various dye-stuffs. I. prepared from various aniline colours

have been much used of recent years. *Marking I.* is generally a solution of nitrate of silver, which on exposure to heat and air darkens and communicates an indelible stain. *Gold and silver I.* are made by mixing finely-powdered leaf of either metal with gum arabic. *Sympathetic I.*, or I. which becomes visible only when acted on by heat or by some chemical preparation, may be prepared from many substances, but the best are certain salts of cobalt.

Printing-I. is of two principal kinds, first, for typography, and second, for lithographic or copper-plate printing. *Typographic I.* is prepared by boiling and burning linseed oil in an iron pot till it becomes thick and gluey, to which black resin and brown soap in certain proportions are added, and the whole well incorporated over a fire. To this, for black, fine lamp-black is added and a very small quantity of indigo and Prussian blue, and for coloured inks the various coloured pigments are substituted for the lamp-black, &c. *Lithographic I.* is a compound of resinous substances with wax, tallow, hard soap, and lamp-black. See LITHOGRAPHY.

Ink'ermann, properly **Ink'jermann,** a village in the W. of the Crimean peninsula, Russia, at the mouth of the Tchernajathales, 5 miles E. of Sevastopol, is famous as the scene of an English-French victory over the Russians, 5th November 1854. A force of 14,000, including part of the Household Guards, successfully resisted the advance, under cover of drizzling rain, of the Russian army, 60,000 strong, and finally drove it back. I. has been called a 'soldier's battle' on account of the extent to which the issue depended on personal intrepidity and physical force. An explosion of some 100,000 lbs. of gunpowder occurred at I. causing great loss of life, 15th November 1855.

In'land Bill of Exchange. See under BILL, BILL OF EXCHANGE.

Inlay'ing is the art of inserting into excisions in metal, wood, or stone, materials of a different colour or texture, or of a more costly description. One process of metal I. is described under DAMASCENING, and by operations similar to those there mentioned the celebrated Indian Bidri or Biddery ware is produced. It consists of a zinc alloy enriched with silver. It takes its name from Bider in the Deccan, where it is extensively manufactured. The decoration of furniture by inlays of light-coloured and valuable woods and ivory was widely practised in Italy during the Renaissance, and in France at even a later period. 'Intarsiatura,' or 'Tarsia,' is the Italian term denoting this style of art; in France and England it is called *marqueterie* or marquetry. Buhl or Boule work is a kind of marquetry. The Persians long excelled in I. articles of wood with ivory, white and stained, arranged in minute geometrical patterns. Most of this work is now executed at Bombay and Goa. The choir fittings of the Certosa di la Pavia are richly decorated with small pieces of ivory. The name *Certosina* has been applied to this combination of walnut or cypress-wood and ivory. The Chinese and Japanese enrich their lacquerwork with inlays of mother-of-pearl and coloured stones. Variegated marbles, agates, cornelians, and other precious stones were inlaid in furniture in Italy during the 15th and 16th centuries. The most magnificent display of stone inlay is that of the Taj-Mahal at Agra.

Inn (the *Œnus* of the Romans), the largest of the Alpine tributaries of the Danube (q. v.), rises from the Lungin Lake at the Septimer Pass in the Engadine (q. v.) valley, which is situated in the S.E. part of Graubünden, or Grisons (q. v.), a canton of Switzerland. From its source at Malojasattel, 5874 feet above the sea, to the town of Passau, where it joins the right bank of the Danube, at a height of 920 feet, it has a northeasterly course of 309 miles. Entering the Tyrol at the Finstermünz Pass, it traverses the Upper Inn Valley and the Lower Inn Valley, becoming navigable at Hall, near Innsbruck; then passing through the Kalkalpen at Kufstein, it enters Bavaria, and makes a semicircular sweep northwards till joined by the Salzach from the S., when, following its original direction, it becomes, as far as Passau, the boundary between Bavaria and Austria.

Innate' Ideas, the name first given by Descartes to certain ideas which it was assumed could not be the product of experience, but must have been, as it were, folded up in the original mould of the mind or thinking faculty, and developed with its growth—from *within*, not from *without*. Among the ideas supposed to be thus 'innate,' are those denoted by the terms God, Eternity, Infinitude, Duty, and, generally speaking, the transcendental conceptions of the 'Pure Reason.' Locke in his *Essay on the Human Understanding* combats the doctrine of I. I. See Tenneman's *Manual of the History of Philosophy*.

Inner House. Scotch law, see COURT OF SESSION.

Inner Temple. See INNS OF COURT.

Inn'es, Cosmo, was born September 9, 1798, at Durris, on Deeside, Aberdeenshire, admitted to the bar in 1822, became Sheriff of Morayshire in 1840, and occupied that position with much credit until 1852, when he was appointed Clerk to the Second Division of the Court of Session. I. was elected to the Chair of History in the University of Edinburgh in 1846. In the labours of the Bannatyne, Maitland, and Spalding Clubs he took a prominent part, the fruits of which were shown in the collating and editing of nearly all the Chartularies of the religious houses. His patient study of public records and contemporary documents is seen to greatest advantage in *Scotland in the Middle Ages*, and in *Sketches of Early Scottish History*, whilst his keen insight into the political and ecclesiastical constitution of antique Scotland may be judged from his introduction to the first volume of *Scots Acts*. From 1865 until his death at Killin, July 31, 1874, he was chiefly engaged in preparing for the press the *Rescinded Acts*, in indexing the folio edition of the *Acts of the Scots Parliament*, a task for which his incomparable skill in deciphering and extracting the meaning of old writings rendered him peculiarly fit, and in preparing for the press his *Lectures on Scottish Legal Antiquities* (1872). Shortly before his death he wrote a brief and appreciative memoir of Dean Ramsay. See *Memoir of C. I.* (Edinb. Paterson, 1874).

Innes, Thomas, was born at Drumgask, parish of Aboyne, Aberdeenshire (1662), sent for his education to the University of Paris (1677), returned to Scotland (1698), where he officiated as priest at Inveravon. In 1701 I. returned to Paris, where, at the Scots College, he devoted himself to writing a history of Scotland, and from the nature of his researches he may be regarded as the first critical inquirer in that field. *A Critical Essay on the Ancient Inhabitants of the Northern Parts of Britain or Scotland* was published at London, 1729. It has a permanent value owing to the conscientious spirit in which he consulted original manuscripts, and, according to his lights, rejected all material based upon irresponsible rumour. I. also wrote one volume of a *Civil and Ecclesiastical History of Scotland*, carried down by him to the year 597 A.D., which, with an unfinished account of two centuries more, has been published by the Spalding Club. I. died at Paris, January 28, 1744.

Innis. See INCH.

Inn'keeper, Law Affecting the. An innkeeper is bound to receive all guests or travellers, and to provide them with necessary food and lodging, unless he can show a reasonable excuse for his refusal. While he is not bound to allow a guest to choose his room, he cannot impose unreasonable terms. If the innkeeper refuse to entertain a guest on tender of a reasonable price, not only may his house be suppressed, but he may be indicted and fined at the suit of the crown, and damage may be awarded against him to the person rejected. If a guest be robbed, the innkeeper is bound to compensate the loss, unless the guest was robbed by his own servant or companion. This liability can only be limited by argument or due notice. But the innkeeper is only answerable for those things which are *within* his house. It has lately been decided that an innkeeper cannot detain the *person* of his guest, nor take off his clothes in order to secure payment of a bill. 26 & 27 Vict. c. 41 limits the liability of the inkeeper as above defined to the value of £30, unless the loss has occurred through his wilful neglect, or unless the property stolen or injured has been deposited *expressly* for safe custody with the innkeeper, who, if such tender be made, is bound to receive it. There does not appear to be any essential difference in the law of England and that of Scotland as affecting innkeepers. In neither country is the host answerable for loss or damage to his guest's property from Act of God (q. v.).

Inn'ocent, the name of thirteen Popes, of whom the following are the most notable:—I. I., born at Albano, near Rome, Pope from 402 to his death, 12th March 417, claimed, as the successor of St. Peter, the settlement of all weighty matters

(*causæ majores*), promoted celibacy amongst the clergy, bitterly opposed the Novatians, and approved the condemnation of Pelagianism passed by the Councils of Milevi and Carthage. His learning and prudence were such that his advice on Church matters was in constant request; and in his epistles, written in a tone of mingled instruction and command, Leo and his successors afterwards found much to justify their assertion of the universal authority of the Roman See. The best edition of these, his only extant writings, is in vol. i. of Coustant's *Epistolæ Pontificum Romanorum* (Par. 1721), and reprinted in the 8th vol. of Galland's *Bibliotheca Patrum* (Ven. 1765–81). I. was canonised by the Church, the 28th July (which Baronius gives as the date of his death) being his saint's-day.—**I. III.** (1198–1216), previously Lothario, Count of Segni, born 1161 at Anagni, and descended from a great Gothic family, was brought up at Rome, and studied theology and canon law at Paris and Bologna. He was chosen Pope when scarcely thirty-seven years old, and shortly after his accession compelled the imperial prefect in Rome to do him homage, thereby disowning feudal dependence on the Emperor. The Romans, however, forced him to submit. I. placed himself at the head of the league of cities in Lombardy and Tuscany, and on the death of the Empress-dowager Constantia was made guardian of her son (Friedrich II.), who had already been chosen Emperor. This duty he discharged in a liberal-minded way, also ruling as regent of the two Sicilies with energy and ability. When the Emperors Otto IV. and Philip of Swabia contended for the chief power in Germany, he confirmed the choice of the former, who in return recognised I.'s right to the March of Ancona, Ravenna, and Pentapolis; but afterwards, when Otto laid claim to Italy, the Pope excommunicated him and raised Friedrich II. to the throne. He excommunicated Philippe Auguste, King of France, for repudiating his Queen, the Danish Princess Ingeborg, and laid France under an interdict, until the king had to yield. He had a successful contest with John (q. v.) of England respecting the choice of bishops; assigned kings to Bulgaria and Wallachia; was absolute in Poland, Hungary, Servia, and Bosnia; imposed a yearly tax on Portugal and Aragon; but could not bow Sverre, King of Norway, who died excommunicated. I. was the instigator of the Fourth Crusade (q. v.). Confident of his power, he called in 1215 a general council in the Lateran (q. v.) of 500 bishops and 900 abbots, besides many temporal princes, and the Patriarchs of Constantinople and Jerusalem. Among these he took his seat 'as the head of a great family of nations, who with paternal authority orders his house,' and in the opening speech he compared himself to 'the sun, who lends the moon (*i.e.*, the state) her light.' This council sanctioned the doctrine of transubstantiation, forbade Bible-reading, and enjoined yearly absolution. The year after I. died of a violent fever. Closely resembling Gregory VII. in force of genius and will, he had yet more learning and depth of feeling. He hated all wrong, was a refuge to the distressed, but a bitter persecutor of all he thought heretics. His own life was spent in self-denial, his court was without magnificence, all his revenues were devoted to the Church. His life object was the elevation of the Papal chair by the firm establishment of its temporal power, and the deliverance of Italy from the Emperor, especially the separation of Naples and Sicily from Germany. In all this he saw the means of exercising an unrestricted power over all Christian nations. The authority of the Roman See is thought to have been never greater than during the pontificate of I. His letters (Baluze, Par. 1682) well illustrate his character and relations to his time. For I.'s life and writings, see Hurter, *Gesch. I. III. und seiner Zeitgenossen* (Hamb. 1834–42).—**I. XI.**, a Pope zealous above all for the restoration of a purer and more rigid morality in Church and State, held the See of Rome from 1676 till 1689; having been born in 1611, a scion of the noble house of the Odescalchi. He waged perpetual war with all irregularities in the personal or official conduct of the clergy, and sought to regulate the minds of the Roman citizens. The Jesuit morality he unsparingly condemned, especially and expressly in the bull of the year 1679. He came into conflict with Louis XIV. in the matter of the right hitherto claimed by ambassadors in Rome to make their palaces an asylum for criminals; put the French ambassador under excommunication, and ultimately carried his point. He also disputed persistently, though in vain, Louis's claim to draw and manage the revenues of vacant bishoprics; and this too, though he applauded the king for his persecution of the Jesuits, and celebrated the revocation of the Edict of Nantes by a solemn Te Deum. The privileges claimed by the Church of France, the *Gallican Propositions*, were solemnly and publicly condemned by I. in 1681. He died in 1689. See Ranke's *Die Röm. Päpste, ihre Kirche und ihr Staat im 16 und 17 Jahrh.*

Inn'ocents, Feast of Holy, observed in the Western Church on the 28th December, in the Eastern on the 29th, is in commemoration of the massacre by Herod of the boys in Bethlehem 'from two years old and under' (Matt. ii. 16), who were regarded as the first martyrs for Christ. Combined at first with Epiphany, a special day was afterwards set apart for the F. of H. I., perhaps as early as the 5th c.

Innom'inate Artery, the first large branch leading off from the arch of the aorta, is the channel through which the blood flows to the right side of the head and neck and to the right arm.

Inns'bruck, the capital of Tyrol, Austria, at the confluence of the Inn with the Sill, 95 miles S. of Munich by rail, in a magnificent valley, fenced in on the N. by rugged calcareous mountain masses, near 9000 feet high, and on the S. by the wooded flanks of the Brenner, with grand dolomite peaks behind. I., constituted a city in 1234, stands on the right side of the river, its suburb on the other side being called St. Nikolaus. The streets are wide and handsome, and contain many stately buildings, amongst which are eleven churches, five monasteries, a Jesuit college, the university, and the theatre. In the Franciscan Church (1563), adorned by the magnificent cenotaph of the Emperor Maximilian I., and monuments of Tyrolese worthies, Christina of Sweden, daughter of the Protestant champion Gustavus Adolphus, made public profession of the Catholic faith in 1651. The university, founded in 1672, and more than once suppressed and restored, has about fifty professors and 650 students. The manufactures are silk, gloves, cotton, and hardware. The position of I. on the railway into Italy renders its transit trade important. Pop. (1869) 16,324, of whom 5000 are soldiers.

Inns of Court are four societies in London for students-at-law, having the exclusive right of calling to the bar. They are the Inner Temple, Middle Temple, Lincoln's Inn, and Gray's Inn. Each inn is governed by its own Benchers (q. v.), who fill up the vacancies in their own body. The benchers of each inn exercise the power of calling to the bar the members of their own inn. (See BARRISTERS.) They have also authority to Disbar (q. v.). The inns of Chancery are subordinate to the I. of C. They are Clifford's Inn, Clement's Inn, Lyon's Inn, New Inn, Furnival's Inn, Thavie's Inn, Staple Inn, and Barnard's Inn. A committee appointed by the benchers of the four I. of C. have decided that ordained clergyman shall not in future be excluded from the bar. Any inn of court may refuse to call any one to the bar without giving a reason for refusal; but no one of fair character is ever excluded.

Innuen'do (Lat. *in*, 'toward,' and *nuo*, 'I nod'), in rhetoric a figure of speech in which the meaning is delicately hinted or insinuated, instead of being plainly expressed. It is effectively used for purposes of sarcasm. The bad oratory of a speaker was thus pitilessly described—'He did his party all the harm in his power; he spoke for it, and voted against it.'

Innuendo, a term of English law procedure, denoting an averment that the signification of an *initial* or of a doubtful word is that which the pleading attaches to it.

Inocar'pus, a small genus of trees belonging to *Leguminosæ*. The seeds of *I. ederlis*, called Ratti by the natives of Tahiti, &c., are used as an article of food both in the Pacific and the Indian Archipelago, being roasted in ashes or boiled, when they have somewhat the flavour of chestnut.

Inocula'tion (Lat. *inoculo*; *in* and *oculus*, 'the eye'), is the act or practice of communicating a disease to a person in health by inserting contagious matter in his skin or flesh, the process being analogous to that of grafting. Many diseases may be thus communicated; but the practice has been chiefly confined to the communication of smallpox and of cowpox which is intended as substitute for it. When the virus of smallpox, taken from a pustule after the commencement of the eighth day, is inserted in or beneath the skin of a person who has not previously suffered from smallpox, the following phenomena are observed:—Shortly after the insertion of the virus, systemic

disturbance takes place. On the second day a shrivelled stain is seen at the point where the virus was introduced; on the third day there is a papular elevation; on the fourth day the papule becomes vesicular, and local irritation commences; on the sixth day there is stiffness in the axilla, and general constitutional disturbance; occasionally on the seventh day, but oftener on the eighth, rigors occur with faintishness, pain in the back, headache and vomiting, a disagreeable taste in the mouth, and offensive breath, after which the eruption appears. When I. is practised, the eruption appears on the eighth day; but when communicated by infection, on the fourteenth. The artificial disease produced by I. is much less dangerous than ordinary smallpox, and it is an almost certain means of preventing a subsequent attack of the disease. The importance of I. as regards personal safety has been long recognised both in India, China, and Europe; but it was not till about 1717 that the operation became generally known in this country, through the influence of Lady Mary Wortley Montagu, who had her own daughter publicly inoculated. Two of the children of Caroline, Princess of Wales, were inoculated, which gave a sanction to the practice. The safety conferred by I. was undoubted, and the mortality resulting from it was but trifling; but the effect upon the community at large was very pernicious, as foci for dissemination were established, which increased the spread of smallpox amongst those who were not protected by I., and the total number of deaths from smallpox increased in one hundred years in the ratio of about five to four. At the beginning of the 18th c. about one-fourteenth of the population died of smallpox, but at the latter end of the same century the number increased to one-tenth, probably in consequence of I. For such obvious reasons the operation of inoculating the poison of smallpox has been rendered illegal in this country by the passing of the Vaccination Act in 1841. See *Smallpox and Vaccination Historically and Medically Considered*, by Dr. Collinson, and *The History of Smallpox*, by Dr. Moore.

In'osite ($C_6H_{12}O_6$), a variety of Glucose (q. v.) found in certain animal organs and in the unripe fruit of certain plants. Its prismatic crystals dissolve in water; and though not fermenting in yeast, it undergoes lactic fermentation when in contact with cheese or flesh.

Inowraclaw, or **Jungbreslau** ('young Breslau'), a town of Prussia, in Posen, 26 miles S.S.E. of Bromberg by rail. A large rock-salt mine was opened here in 1871. Pop. (1875) 9139.

In Part'ibus Infide'lium (Lat. 'in the regions of the unbelievers') is a phrase applied in the Church of Rome since the 13th c. to those archbishops and bishops who have no diocese. The titles are, as a rule, taken from places in the East which were once episcopal sees. In 1877 the total number of these dignitaries was 164.

In'quest. See CORONER.

Inquisi'tion, in canon law, means either a judicial proceeding merely on public report, without accuser or informer, or else a particular tribunal established by the Popes to judge Spanish heretics. Before Constantine, the only authority was the bishops, and the only punishment was excommunication. After that, the emperors frequently passed laws inflicting heavy civil penalties on the various heretical sects. No doubt, persons were appointed to carry out these laws, but it is about A.D. 382 in a law of Theodosius against the Manichæan sects that the name *inquisitors* first occurs; they were to be named by the Prætorian Prefect. These laws gradually increase in severity; legal disabilities, banishment, forfeiture, death, are necessarily proclaimed. The principle is that '*whoever violates the religion established by God sins against public order.*' In 541 the decrees of the four general councils were made part of the imperial statute book, and all suspects who could not satisfy the Church of their innocence were declared *infamous*. The third Lateran Council distinguishes between spiritual penalties and those inflicted by the aid of the civil courts, but by this time the councils had undoubtedly assumed a power of defining penalties which Bossuet, Fleury, and others, refer to the implied consent of the secular power. Fleury says the I. began at the Council of Verona (1184), where the bishops and certain lay lords were directed to search out suspects, penitents, and 'relapsed' persons according to public rumour, and to appoint *commissioners* to help them in the business. *Rainier* and *Guy*, sent by Innocent III. to the Albigenses in 1198, were probably the first true inquisitors. But even the Dominicans sent to Languedoc in 1233 had no regular jurisdiction; it was merely their 'holy office' to stir up the crusade with the cross of cloth upon the breast, to urge the civil magistrates to punish. It was Gregory IX. who first clearly defined the functions and procedure of the inquisitorial missions sent to different countries. Their operations were much facilitated by the laws passed by the Emperor Friedrich II. (himself a sceptic), which sentenced obstinate heretics to the stake, and penitents to perpetual imprisonment. A bull of 1252 shows that in Italy the rectors and consuls of the municipalities were to cooperate with the Dominicans and the bishops, who are the lawful judges of heresy. There are traces of concordats between the Pope and certain States for the erection of an I., which was generally put into the hands of an order of monks. The excesses of the 'Fratres Prædicatores' frightened and enraged the people. Apparently, the name of the informer was kept secret, the evidence was taken down before a notary and two priests, the accused got no list of witnesses, was kept in prison till his trial, and was tortured into confession. If the evidence was insufficient, he was still compelled to 'abjure' with certain penalties. The 'relapsed' heretic was instantly *relaxatus*, or handed over to the magistrate, who gave him the choice of strangling in private and burning in public. But it was in Spain that the I. flourished most. By a bull of 1483 Thomas Torquemada (called in Latin *Turrecremata*) was appointed Inquisitor-General for that country. He sat in a 'Consejo de la suprema Inquisicion,' without appeal to Rome. His legal assessors, Gutierrez and Medina, drew up the famous articles, which are not so unfair or severe as the rules which had previously been put in force by the national Spanish inquisitors against the new 'Christians' or Jews. In particular, a list of witnesses was given, and property was not confiscated. The Spanish I. was introduced into Sicily, but was totally different from the constitutional inquisitions which were permitted in the Italian States. (See Sarpi's *History of Venetian I.*, 1638.) In Naples down to 1799 there was a 'Tribunale contro quello del Sant Uffizio,' expressly formed to protect the kingdom from the Roman I. In 1543 Paul III. founded the 'Congregation of the Holy Office,' which consisted of six cardinals, with power over all inquisitors, except the Spanish, and with power to proceed, punish, confiscate in the first instance, and also on appeal. This afterwards became the 'Holy Roman and Universal I.,' several officers called *consultors* and *qualificators* (who drew the cases) being added. This body still exists, watching specially over the conduct of the clergy and the publications of the press. Pius VII. abolished torture. 'It holds,' says Lacordaire (in his *Mémoire pour le Rétablissement des Frères Prêcheurs*), 'a middle place between the civil tribunals (which look only to external acts) and the purely voluntary confessional. It is the only court in the world which for three centuries has not shed a drop of blood.' The I. was made use of by the Guises against the Huguenots in France, but not since the Edict of Nantes. The Spanish I. (of which the history has been written by Llorente), after a short period of suspension under Napoleon, was finally suppressed in 1820. The last burning took place in 1781. The punishment of spiritual crimes has now been universally assumed by the secular courts, or by ecclesiastical courts which have received their constitution from the civil law. See the histories of Nigrinus (1582), Paramo (1598), Marsolier (1613), Limborch, the best of the old works (1692), Rule (1874); for I. in France, De la Mothe-Largon (1829); in Spain, Gonsalvi (1567), Arnold (1609), Bebel (1692), Puigblanch (Eng. trans. by Walton, 1816), De Maistre, *Lettres sur l'Inquisition Espagnole* (1822), Hefele, *Ximenes* (2d ed. 1851, trans. by Dalton 1860); in Portugal, Herculano (1858), and at Goa, Dellon (1663). See also Brandt's *Netherlands*, M'Crie's *Spain* and *Italy*, Ranke's *Popes*, the works of Prescott and Motley; and Hauréau, *Bernard Delicieux et l'Inquisition Albigeoise* (Par. 1877). Prescott's statements regarding the I. have been reviewed by Archb. Spalding, *Miscellanea* (1866)

Inrol'ment. For safe custody and evidence, deeds are sometimes inrolled upon the records of a division of the High Court of Justice, or of a Court of Quarter Sessions. I. of a deed does not make it a record. A record is the I. of judicial matter transacted in a court of record, and of which the court takes notice; but I. of a deed is a private act of those concerned.

Insan'ity is 'a condition of the mind in which a false action of conception or judgment, a defective power of the will, or an uncontrollable violence of the emotions and instincts, have,

separately or conjointly, been produced by disease, the cerebro-mental disorder being of such a nature as to suspend or impair the action of the healthy will.' *Non compos mentis* is the general legal term used to include persons labouring under mental disabilities, and four classes were comprised under this term by Coke: 1. Idiot, or fool natural, who from his nativity by a perpetual infirmity is *non compos mentis*. 2. A person who was of good sound memory, and by sickness, grief, or other accident wholly loses his memory and understanding. 3. A lunatic, *lunaticus*, who has sometimes his understanding and sometimes not, *qui gaudet lucidis intervallis*, and therefore he is called *non compos mentis* so long as he has not understanding. 4. A person who, by his own vicious acts, for a time deprives himself of his memory and understanding, as he that is drunken; but such a person has no privilege by this voluntary contracted madness.

Various classifications of I. have been proposed by Alienists, and the International Congress of Alienists, at their meeting in Paris in 1867, drew up the following classification, which is a combination of the ætiological and the symptomatological methods:—1. Simple I. comprehends the different varieties of mania, melancholia and monomania, circular I. and mixed I., delusion of persecution, moral I., and the dementia following these different forms of I. 2. Epileptic I. means I. with epilepsy, whether the convulsive affection has preceded the I. and has seemed to have been the cause, or whether it has appeared during the course of the mental disease only as a symptom or complication. 3. Paralytic I. or dementia should be considered as a distinct morbid entity, and not at all as a complication, a termination of certain forms of I. There should be comprehended, then, under the name of paralytic insane, all the insane who show, in any degree whatever, the characteristic symptoms of this disease. 4. Senile dementia is the slow and progressive enfeeblement of the intellectual and moral faculties consequent upon old age. 5. Organic dementia embraces all the varieties of dementia other than the preceding, and which are caused by organic lesions of the brain, nearly always local, and presenting, as almost constant symptoms, hemiplegic occurrences more or less prolonged. 6. Idiocy is characterised by the absence or arrest of the development of the intellectual and moral faculties, imbecility and weakness of mind constituting two degrees or varieties. 7. Cretinism is characterised by a lesion of the intellectual faculties, more or less analogous to that observed in idiocy, but with which is uniformly associated a characteristic vicious conformation of the body, an arrest of the development of the entirety of the organism. Under the titles of 'ill-defined forms,' 'other forms,' are to be set down all the varieties of mental alienation which it shall seem impossible to associate with any of the preceding typical forms. Drs. Bucknill and Tuke, in their standard work on *Psychological Medicine*, group mental defects and disorders under five great divisions:—The *first*, comprising idiocy, imbecility, and cretinism, states of undeveloped intellectual power. The *second*, dementia, a state in which intellectual power has been destroyed. The *third*, delusional insanity, or those states in which marked delusion is present, whether assuming a melancholy character (*Melancholia* with delusion), an exalted character (*Monomania* with delusion; the intellectual monomania of Esquirol), or a distinctive character (*Homicidal* and *Suicidal I.*, &c., with delusion). The *fourth*, emotional I., or morbid states of the emotions without delusion, whether of a melancholy character (*Melancholia simplex*), or of an exalted character (partial exaltation; the affective monomania of Esquirol), or whether marked by a perverted moral sense, or by impulses chiefly of a destructive character (*Homicidal I.*, &c., without delusion or mental weakness; instinctive monomania of Esquirol), constituting moral or emotional I. *proper*. The *fifth*, mania, a state of general mental excitement or exaltation. All these forms or varieties of I. are liable to complication with epilepsy, or, if acquired, with general paralysis. According to the summing-up of the Master in Lunacy in the case of Windham in 1862, 'mere weakness of character, mere liability to impulse, or susceptibility of influence, good or bad, mere imprudence, extravagance, recklessness, eccentricity, or immorality—no, not all these put together would suffice, unless they (the jury) believed themselves justified, on a view of the whole evidence, in referring them to a morbid condition of intellect.' See Shelford's *Law of Lunatics*; Collinson *On Lunacy*; Bucknill and Tuke, *Psychological Medicine* (Lond. 1874); *The Journal of Mental Science* (Lond.).

Insanity, Law Regarding. See IDIOTS AND LUNATICS.

Inscrip'tions (Lat. '*in*, 'on,' and *scribo*, 'I write'), characters engraved on some durable material, as stone or metal, are often of extreme antiquity. How old and widespread the practice was of thus recording public events is shown by the fact that the radical notion of the Gypsy *chinava*, the Gr. *graphô*, the Lat. *scribo*, and the Eng. *write*, is always that of 'scratching' or 'engraving.' The earliest known I.—those of Egypt—are supposed to be at least 500 years older than the first writings on papyrus, being assigned to the reign of Sent, of the second dynasty (3000 B.C.). Next in point of date come the cuneiform I. of Assyria (2000 B.C.); the Chinese (1200 B.C.), the inscription of Yu (2205 B.C.) being of doubtful authenticity; the Phœnician (900 B.C.); the Greek (665 B.C.); the Lycian (530–335 B.C.); the Indian (400 B.C.); and the Roman (145 B.C.). The dates of the Etruscan I., of the Runes of Scandinavia, the Oghams of the Celts, as also of the picture-writings of the Mexican Aztecs, have not yet been determined. With the Renaissance sprang up a taste for the collection of I. as of other antiquities, the discovery of many important monuments—*e.g.*, of the Eugubine Tables—belonging to that period; and in 1663 the Académie des I. was founded by Louis XIV. (See INSTITUTE OF FRANCE.) But up to the present century scholars had confined themselves to the interpretation of Greek and Latin I.; and the hieroglyphics of the Pyramids, the cuneiform records of the rocks of Behistun, the Himyaritic tablets of Southern Arabia, remained a dead letter. The first impulse to their decipherment was given by the discovery of the Rosetta Stone in 1799; and since that date the ancient Egyptian, Zend, Accadian, and other extinct languages have been recovered, mainly through the labours of such men as De Sacy and Champollion, Grotefend and Rask. The gains to the historian and philologist from this branch of study have been immense, as in many instances the sole surviving remains of the history and language of a people were contained in its I. In one case only, that of the Etruscan monuments, have all attempts at interpretation resulted as yet in failure. But the art of decipherment is still young, and some day it will doubtless force from the I. of Etruria the full ethnic and linguistic history of their lost and forgotten founders. A striking instance of the application of that art was furnished in the case of some Norse Runes engraved on one of the stone lions that surmount the entrance to Venice Arsenal. These have been deciphered, from photographs, by Professor Rafn of Copenhagen, and found to record the capture by Harald Hardraga of the Piræus, from which these lions were originally brought to Venice. See CUNEIFORM, EUGUBINE TABLES, GRAFFITI, HIEROGLYPHICS, MOABITE STONE, OGHAMS, ROSETTA STONE, and RUNES.

Insec'ta ('insects'), a class of *Arthropodia* (that is, higher annulose animals, with jointed limbs), distinguished (1) by having the head, chest, and abdomen distinctly marked and separable; (2) by having not more than three pairs of legs in the adult state; (3) by having the legs borne by the thoracic segments only; (4) by usually having two pairs of wings; (5) by the possession of *tracheæ* or air-tubes as the breathing or respiratory organs; and (6) by being provided with a single pair of *antennæ* or 'feelers.' The insect class is one exhibiting a decided uniformity of type and structure. Extreme variations are no doubt seen within its limits, but these variations are themselves sharply marked off from neighbouring classes and groups. The examination of this group of animals may be pursued according to a defined order, beginning with the consideration of the *exoskeleton* or outer layer of the body. In the insect, as in the crustacean, the hard parts of the body form an outer and protecting casing, which also serves for the attachment of muscles. The outer covering of the body in insects is usually of *chitinous* or horny nature; and each somite or joint of the body appears to exhibit a structure composed of six pieces. Thus the upper or back (dorsal) half of each segment is named the *tergum*, the lower half is known as the *sternum*, the side pieces as *pleura*, the sternum being further subdivided into *epimeral* and *episternal* pieces. The *insect body* itself is composed of some twenty segments, of which five or six form the head; the thorax or chest is invariably composed of three joints; while those of the abdomen may number from nine to eleven. The *head segments* are united to form an apparently single mass; and the appendages of this region are modified for sensory purposes, and also to serve as

masticatory organs, or those connected with the mouth apparatus. The appendages of the *head* may be examined in order, and consist of *eyes*, *antennæ* or feelers, and the *organs of the mouth*. The antennæ of insects never exceed two in number, and present great variations in form and size. In their simplest form they exist as straight, jointed filaments, but in many insects they are forked, in others club-shaped, while in some they may mimic forms of vegetation, and appear in the likeness of ferns and other objects. The function of these antennæ is undoubtedly that of acting as organs of touch; but it is highly probable that they may subserve other functions, *e.g.*, taste, or even hearing. The *eyes* of insects consist of simple eyes or *ocelli*, and of large *compound* eyes, the latter being formed of aggregations of simple eyes. Each simple eye consists of a little hexagonal *facet*, and includes a *lens*, nerve filament, and other structures entering into the essential composition of an eye. In many insects large numbers of facets exist in the compound eyes. The ants have 50 facets, some butterflies 4000. The eyes may be supported on short stalks or *peduncles*, but the latter are never movable, as in crustaceans. The organs of the *mouth* in insects present a striking *homology* or similarity in fundamental structure. Two chief types of mouth are found in insects. The biting or *masticatory* mouth is well shown in beetles. It includes (*a*) a *labrum* or upper lip, (*b*) a pair of *mandibles* or larger jaws, which in insects never bear *palpi* or organs of touch, (*c*) a pair of lesser jaws or *maxillæ*, which bear one or two pairs of *palpi* (*maxillary palpi*), and (*d*) a lower lip or *labium*, with *labial palpi*, this latter structure being in reality composed of a coalescent and second pair of maxillæ. This latter and primitive condition of the *labium* is seen in Orthopterous insects and certain *Neuroptera*. Other structures often mentioned in connection with the mouth of insects are the *ligula* or front portion of the labium; the ligula being sometimes divided (as in some beetles—*Carabidæ*—and in bees) into three lobes, of which the two outer are named the *paraglossæ*, the middle process being termed the *lingua* or tongue. The second form of mouth is termed *suctorial*. It is seen in butterflies, and is adapted for the prehension of flower juices. Here the same parts are to be viewed as in the mouth of the beetle, only having undergone considerable modifications, and exhibiting a functional adaptation to the work of suction. The (*a*) labrum is now rudimentary, as also are the (*b*) mandibles, but the (*c*) maxillæ are drawn out, and are greatly elongated to form a tubular organ, the *anthia* or *proboscis*, by means of which flower juices are sucked up. The maxillary palpi are small, and the (*d*) labium is small, but its palpi are greatly developed, and form two hairy pads or cushions, between which the proboscis is coiled up when at rest. Thus we find in the butterfly the same fundamental composition of mouth as in the beetle. In wasps and bees, a variety of mouth is found which presents us with a combination of the masticatory and suctorial types. The (*a*) labrum and (*b*) mandibles exist as in the beetle; the (*c*) maxillæ being developed to form long sheaths protecting the (*d*) labium, which exists as in the form of a tongue. In the bugs and their allies (*Hemiptera*), the (*b*) mandibles and (*c*) maxillæ exist as sharp lancets, while the (*d*) labium forms a protective sheath. In the flies (*Diptera*), the (*d*) labium undergoes a great development, and forms a prominent tongue, the other parts of the mouth being developed simply as sheaths to the labium. The *thorax* or chest of the insect consists of three segments, named respectively, as we proceed backwards, the *prothorax*, *mesothorax*, and *metathorax*. The prothorax bears the first pair of legs; the mesothorax, the second pair of legs and first pair of wings; and the metathorax, the third pair of legs and second pair of wings. The *legs* of insects may be more numerous in the larval than in the adult stage, and may be terminated in various ways. The last joints of the leg constitute the *tarsus*. The *wings* are delicate expansions of the integument, and consist each of two delicate membranes, between which the supporting ribs or *nervures* are stretched. The nervures are in reality hollow tubes, and are to be regarded as extensions of the *respiratory* or breathing system, the wings being adapted by their movements to assist in respiration. In most insects two wings are developed; in the flies the front pair only is present; and in the *stylops*, or bee-parasite, the hinder pair is alone represented; whilst in the lice, fleas, and in the females of some winged genera (*e.g.*, cockroaches), wings may be wanting. The *muscles* of insects lie beneath the integument, of which, indeed, they form a mere continuation. The fibres of the muscles are not gathered into distinct bundles as in higher animals, and exhibit in many cases a *striated* or striped structure. The muscular system of many insects, and especially in some larvæ, is exceedingly complicated. Lyonnet found in the larva of the goat-moth 228 muscles in the head alone; the entire body possessing 3993 muscles. The muscular power of insects is, relatively to the size of the body, very great. The flea leaps 200 times its own height, and some beetles will support and move about under weights out of all proportion to their size; a beetle weighing a few grains only will escape from a pressure of 20 to 30 ounces. The *digestive system* varies with the habits and food of the animal similarly to the mouth. In *stylops*, or the bee-parasite, and in young bees, the intestine ends in a blind sac; these insects living on fluids, and having no solid excreta to get rid of. There are three coats found on investigating the structure of the digestive system; an inner or *mucous*, a middle or *muscular* coat, and an outer or *peritoneal*. The *æsophagus* or gullet may have a *crop* (the sucking stomach of flies, bees, and butterflies); and a *gizzard* and true stomach or *preventriculus* also exist. There is, in fact, a singular likeness between the confirmation of the digestive system of birds and that of insects. The intestine is divided into a *small* and *large* portion. *Salivary glands* exist in the mouth in many cases. No true *liver* exists, the place of this gland being supplied by *biliary tubes*. The *kidneys* are represented by *urinary tubes*. The *heart* lies dorsally, or on the back-surface, and consists of a long pulsatile sac, divided into seven or eight compartments separated from each other by valves. The flow of blood througl the heart takes place towards the head, each chamber sending blood onwards to the compartment before it. At the head the blood appears to escape from the vessels, and freely circulates slowly through the *sinuses* of the body, or the ill-defined spaces which exist between the various tissues and organs. The blood itself is usually colourless, and contains corpuscular elements. During this latter stage of its circulation, it is subjected to the action of the *respiratory system*, which in insects consists of *air-tubes* or *tracheæ*. Each *trachea* is an elastic tube, formed, like the wing, of two delicate membranes, between which a spiral filament is coiled up; this filament preventing the collapse of the tube and permitting of its adjustment to the movements of the body. The *tracheæ* extend everywhere throughout the body of the insect, being distributed in greatest quantity to the active tissues—such as the muscular tissue—of the body. The insect thus, like the bird, may be said to breathe in every part, and is rendered in this way light and buoyant for flight. The acts of respiration and inspiration are effected by the contraction and expansion of the abdominal segments, aided by the wing movements. The air is admitted to the tracheæ by apertures called *spiracles*, which can be closed at will, and which exist generally to the number of eleven on each side of the body. The *nervous system* lies ventrally, or on the floor of the body, and consists of a chain of *ganglia* or nerve-knots, typically double, but usually united to form a single cord. The *præ-æsophageal* and *infra-æsophageal* ganglia, or those situated above and below the gullet, are especially large. Insects are *diæcious* that is, have the *sexes* situated in *distinct individuals*. *Reproduction* takes place through the production and development of *ova* or eggs, but in certain cases—exemplified by the case of the *Aphides* or plant-lice—peculiar phenomena may be observed in the generative process, since female insects are known to produce eggs and young without the presence or influence of a male insect. (See PARTHENOGENESIS.) The male organs include a *penis* or copulatory organ, *vesiculæ seminales*, *vasa deferentia*, and *testis*, the latter being glandular and tubular in form, and being situated in the abdominal cavity, on each side of the alimentary canal. The female organs include a simple tubular *ovary* and an *oviduct*; a *spermatheca*, or receptacle in which the male fluid may be stored up being sometimes found—as in queen bees. The *eggs* vary in form and size; and in some insects (*Melophagus* and *Braula*), the *larva*, or young insect, may be perfectly formed before it is expelled from the female organs.

The *development* of I. presents many interesting features connected with the occurrence of what is known as *transformation* or *metamorphosis*. This name is used to indicate the series of changes, of a greater or less extent, which the insect undergoes in passing from its miniature to the adult state. Considered in a cursory manner, *metamorphosis* may be said to correspond to the

developmental stages passed by the young of most other animals while still *within* the egg. While within the egg, the body of the insect soon becomes segmented, and sooner or later—in such insects as flies, bees, beetles, and butterflies—escapes from the egg as the *larva* or *caterpillar.* This latter is a worm-like creature, which feeds voraciously, grows largely, and makes for itself an investing case or cocoon, in which it passes the second or *pupa* stage of its existence. Occasionally the *chrysalis* or *pupa case* may be formed by the larval skin. Within the pupa case a wonderful transformation takes place; the larval body being literally broken down by the process of *histolysis*, while its elements are rebuilt and transformed through the process of *histogenesis* into that of the *imago* or perfect insect, which, provided with wings and sexual organs, sooner or later escapes from the pupa case, and ascends into the air in pursuit of a free existence. Such a metamorphosis as that just described is termed *complete* or *holometabolic.* In this case, the larva is unlike the perfect insect or *imago*, and the pupa is quiescent. In the grasshoppers, crickets, dragonflies, bugs, &c., the metamorphosis is termed *incomplete* or *hemimetabolic.* The larval grasshopper, for example, closely resembles the perfect insect in form, and the chrysalis or pupa is active, and differs from the *imago* chiefly in the absence of wings and in the non-development of sexual organs. Some lower insects (lice, spring-tails, &c.) undergo no metamorphosis whatever, and do not differ from the *imago* on leaving the egg, save in respect of size. These latter are named *ametabolic* insects. Metamorphosis in some insects may extend over long periods of time. The cockchaffer passes three years in attaining its perfect form, and the gold beetles and other insects occupy a similar period in undergoing development. The process of development is retarded by cold. Reaumur kept a butterfly pupa for two years in an icehouse, and during that period the insect exhibited no tendency to further development, but became the *imago* on being removed to a warmer place.

Classification of I.—Insects have been classified according to very different methods. Probably the most simple and natural arrangement of the class is that detailed in the following table, in which the characters of the orders are also given:—

	ORDERS.
Section A.—AMETABOLA. Undergoing no metamorphosis and wanting wings; eyes simple, sometimes wanting.	1. ANOPLURA.—Ex. Lice. Insects having suctorial mouth and simple eyes only. 2. MALLOPHAGA — Ex. Bird-lice Mouth masticatory. 3. THYSANURA — Ex. Spring-tails, *Poduræ*, &c. Abdomen having long appendages.
Section B.—HEMIMETABOLA. Metamorphosis incomplete; larva differing from imago chiefly in absence of wings; pupa active.	4. HEMIPTERA—Ex. Bugs. Mouth suctorial, beak-shaped; wings four, with anterior halves horny in some. 5. ORTHOPTERA—Ex. Crickets, Locusts, Grasshoppers, Cockroaches, &c. Wings straight-veined, front pair usually of leathery consistence; mouth masticatory. 6. NEUROPTERA — Ex. Termites, Dragonflies, Mayflies, &c. Mouth masticatory; wings large and membranous, larvæ active and hexapod.
Section C.—HOLOMETABOLA. Metamorphosis complete; larva unlike imago, pupa quiescent.	7. APHANIPTERA—Ex. Fleas. Wings absent; mouth suctorial. 8. DIPTERA — Ex. Flies. Hinder wings absent; mouth suctorial. 9. LEPIDOPTERA — Ex. Butterflies and Moths. Wings four, covered with scales; mouth suctorial. 10. HYMENOPTERA — Ex. Bees, Wasps, Ants. Mouth partly masticatory and partly suctorial; wings four, membranous. 11. STREPSIPTERA—Ex. Stylops or Bee-parasite. Anterior wings wanting, and replaced by twisted filaments; hinder wings developed in males only; jaws rudimentary. 12. COLEOPTERA—Ex. Beetles. Front wings horny, forming elytra or sheaths for the posterior pair; mouth masticatory.

The *origin* of insects (or their *ætiology*), according to Darwin's theory, has been discussed by Sir J. Lubbock, amongst others. This author assumes that insects have 'descended from ancestors more or less resembling the genus *Campodea* (insects belonging to the order *Thysanura*), with a body divided into head, thorax, and abdomen; the head provided with mouth parts, eyes, and one pair of antennæ; the thorax with three pairs of legs; and the abdomen, in all probability, with caudal appendages. . . . From what lower group the Campodea type was itself derived is a question of great difficulty. Fritz Müller, indeed, says, "If all the classes of Arthropoda (Crustacea, Insecta, Myreopoda, and Arachnida) are indeed all branches of a common stem (and of this there can scarcely be a doubt), it is evident that the water-inhabiting and water-breathing Crustacea must be regarded as the original stem from which the other terrestrial classes, with their tracheal respiration, have branched off."' *Fossil* insects are first known to occur in the Devonian rocks of N. America. These earliest fossil forms belong to the *Neuropterous* order. In Carboniferous rocks the remains of *Neuroptera*, *Orthoptera*, and *Coleopterous* insects occur; while in Jurassic formations the orders *Hemiptera* and *Hymenoptera* are first represented. The *Diptera* and *Lepidoptera* first appear in rocks belonging to the Tertiary system.

Insectiv'ora, an order of Mammals, represented by the moles, shrews, hedgehogs, and their allies. In these animals the *Placenta* (q. v.) is discoidal and deciduate, the collar-bones are well developed, and the animals walk on the soles of their feet (*Plantigrade*). The feet have each five toes. Incisor, canine, and molar teeth are present in all cases, the molars being provided with little points or *cusps*, adapted for crushing the insects on which the I. feed. The animals are of small size. They hybernate during winter. As a rule they are subterranean in habits, and active chiefly during the night. They are distributed throughout the world, with the exception of S. America and Australia. The *Talpidæ* (moles), *Soricidæ* (shrew-mice), and *Erinaceidæ* (hedgehogs), are the three included families.

Insesso'res, Pass'eres, or **Perch'ing Birds**, an order of the class Birds (q. v.), distinguished chiefly by the negative characters of the forms included within its limits. They are represented by most of our common and smaller birds. The toes are four in number, and are directed three forwards and one backwards; some forms, however, exemplified by the swifts, having the under toe also turned forwards. The toes and tarsi are covered with scales, and the outer toe is commonly united to the middle toe at its base. The primary quill-feathers of the wings usually number ten, the first of these feathers being generally of small size. The tail is composed in most I. of twelve feathers. The form of the bill varies greatly, and is used as a basis for the classification and division of the order. The chief sections are the *Conirostres* (q. v.), the *Dentirostres* (q. v.), the *Fissirostres* (q. v.), and the *Tenuirostres* (q. v.).

Insol'vency. See BANKRUPTCY.

Inspec'tor (Lat. *inspicio*, 'I look into'), a military title somewhat loosely applied to any officer charged with regimental or half-yearly inspection, &c. There are inspectors-general of infantry, cavalry, and artillery, of musketry and volunteers, and also in the medical branch of the service of hospitals. In the police force an I. is the officer next in rank to a superintendent.

Inspec'torship, Deed of, is a deed by which inspectors of the dealings of an insolvent person are appointed for a limited period, or till he has paid his debts, or such composition *for them* as the creditors have agreed to accept. See BANKRUPTCY.

Inspectors of Schools. See PUBLIC SCHOOLS.

Inspira'tion (Lat. *inspiratio*, from *in*, and *spiro*, 'I breathe'), according to the orthodox doctrine of the Church, means the influence of the Holy Spirit on the minds of the writers of the Scriptures, which rendered them the organs of God for the infallible communication of his mind and will, and in virtue of which the Scriptures are regarded as the Word of God. The earliest theory of I. (1), held regarding the Old Testament Scriptures by the Jews, and afterwards applied by Christians both to the Old Testament and New Testament, regarded it as *verbal*, meaning that the very words and phrases as well as the subject-matter emanated from the Holy Spirit. In reference to the manner in which the human agents are affected, this has been called the Mechanical theory, according to which the sacred

writers were mere automata in the hands of the Spirit, as pens which wrote what he dictated, or as harps from which he drew what sounds he pleased. It is unnecessary to enter into objections to this theory, because in its original extreme form it is now generally abandoned in favour of (2) *Plenary* I., which is defined as a divine influence which is 'full and sufficient to secure its end,' that end being 'the perfect infallibility of the Scriptures in every part as a record of faith and doctrine, both in thought and verbal expression.' According to this definition, *plenary* I. does not differ much from *verbal* I. in its results. The chief difference lies in the manner in which it is held to operate on the human agents. According to this theory, which has been called the Dynamical, the Holy Spirit is regarded as exerting an influence which guides and directs the human agents, not as exerting a power which supersedes all their energies. The sacred writers, who were employed as the organs of God, so that what they taught he taught, were used according to their different natures and their peculiar gifts and endowments, writing out of the fulness of their own thoughts and feelings, and employing the language and modes of expression which were the most natural and appropriate to them. The proofs adduced that this is the Scriptural view of I. are as follows :—1. From the signification and usage of the word, as in 2 Tim. iii. 16; 2 Pet. i. 21. 2. From the meaning of the word 'prophet,' who is represented in the Old Testament as the mouth of God :—Isa. li. 16; Jer. i. 9, *cf.* Jer. xxxvi 17, 18; Exod. iv. 14-16, vii. 1. 3. From the declarations that what the prophets said the Spirit said :—Matt. xxii. 43; Ps. xcv. 8, *cf.* Heb. iii. 7; Jer. xxxi. 33-34, *cf.* Heb. x. 15-17; Ps. ii. 1, *cf.* Acts iv. 25; Acts xxviii. 25. II. The I. of the New Testament writers in the same way is held to be proved :—(1) By the promise of the Holy Spirit given by Christ; (2) a promise which was fulfilled on the day of Pentecost; (3) after which they claim to be the infallible organs of God in all their teaching (*cf.* 1 Cor. xiv. 37; 1 Thess. ii. 13; 1 John v. 10); (4) by the testimony of St. Paul (1 Cor. ii. 7-13); (5) claims which were all duly authenticated by (*a*) the nature of the truths which they communicated, (*b*) the power which these truths exerted, (*c*) the inward witness of the Spirit (1 John v. 10, ii. 20), and (*d*) miraculous gifts (2 Cor. xii. 12; Heb. ii 4).

It is objected to this theory of *plenary* I. that the sacred writers (1) contradict (*a*) themselves and (*b*) each other, and (2) teach error—what is false in history, science, and morality. To which it is replied (1) in reference to the discrepancies and contradictions, that (*a*) they are for the most part trivial, (*b*) the great majority are only apparent, (*c*) many of them may fairly be ascribed to the errors of transcribers, and (*d*) the marvel and the miracle is that there are so few of any real importance. (2) In answer to the second class of objections it is remarked, (*a*) that we must distinguish between what the sacred writers themselves thought or believed, and what they teach; (*b*) that the language of the Bible being that of common life, is founded upon apparent and not upon scientific truth; (*c*) that there is a great distinction between theories, which are often contradicted by the Bible, and facts, which never are; and (*d*) that there is also a distinction to be made between the Bible and our interpretation of it, the latter of which must yield if proved to be wrong.

Other theories of I. may be noticed :—1. That which goes by the name of *gracious* I., according to which the sacred writers were merely holy men under (1) the ordinary guidance of the Spirit, or (2) a pre-eminent degree of spiritual illumination. 2. The theory of *partial* I. One form of which (1) is that only some parts of the Bible are infallible; *e.g.* (*a*) the Law and the Prophets, (*b*) the New Testament, or (*c*) the discourses of Christ, respectively. (2) Others limit the I. to the doctrinal teaching, as distinguished from mere matters of fact; (3) others, to the thoughts as distinguished from the words; and (4) others hold that there were different degrees of divine guidance. 3. Some have held that I. was simply an exaltation of intuitional consciousness, *i.e.*, that it took the place in the writers of great genius and great goodness, with the same results. See Hodge's *Syst. Theology* (Edinb. 1873); Gaussen's *Theopneustia* (Lond. 1841).

Installa'tion, in church law, means the ceremony by which a canon or prebendary is legally confirmed in a benefice. The similar ceremony for the confirmation of a bishop is 'enthronisation;' for that of a rector, 'induction.'

In'sterburg, a town of Prussia in the province of E. Preussen, on the Inster, 60 miles E. of Königsberg by rail, has manufactures of beet-sugar, woollens, cottons, hosiery, and machinery. A number of Scottish families settled in trade here in the 17th c. I. was once a seat of the Teutonic knights. Pop. (1875) 16,380.

In'stinct (Lat. *instinctus*, from *instinguere*, 'to urge on'), the general name under which the nervous acts of lower animals, as applied to the regulation of their lives, are included. The term, however, has been commonly restricted to denominate those acts more especially in which the lower animals appear to imitate the actions of man. Very frequently, however, this distinction is more apparent than real. Impulses of the same nature, as far as observation or hypothesis may determine, animate man and lower animals; for example, when danger threatens, and when the 'I.' of self-preservation becomes a leading idea in the mind. Many acts of man's life are regulated by experience, and are primarily gained through experience, in the same manner in which many lower animals gain a knowledge of their surroundings. At the same time, and while admitting the common origin and similar nature of many of the acts of man and lower animals, there exists in the operations of the human mind an evident appreciation of the nature and reasons of its own operations and working. We have, in fact, to account for the due explanation of the superiority of man's mental organisation, by admitting the development of *consciousness* or the knowledge of self, and of the why and wherefore of our acts. As Dr. Carpenter remarks, the study of comparative anatomy demonstrates that it is in man that the *cerebrum* or true brain attains its highest development, and it is in man that the degree of *intelligence*—'using the latter term as a comprehensive expression of that series of mental actions which consists in the *intentional* adaptation of means to ends, based on definite *ideas* as to the nature of both'—is found accordingly to attain its highest phase. Brain development and the possession of an *intelligence* which stands out in marked contrast to pure unreasoning *instinct*, stand in a direct ratio to each other. '*Instinctive* actions,' according to Dr. Carpenter, 'are performed automatically, in obedience to internal impulses, without even the perception of their adaptiveness on the part of the being who is the agent in them; these impulses being called into play by impressions on the nervous system, which are made either by external objects, or by changes in the individual organism.' The justness of this distinction becomes obvious when we analyse our own consciousness, and distinguish our own instinctive actions from those which involve intelligence; for we are thus led to perceive that, in regard to those operations which are most closely concerned in the maintenance of our own lives, and in the continuance of the race, provision has been made in the mechanism of the automatic portion of our nervous system, so as to render them independent of the exercise of Intelligence or the assertion of the Will on our part. 'Thus,' continues Dr. Carpenter, 'the infant seeks the nipple, and puts its muscles into suctorial action, without any knowledge that by so doing it will relieve the uneasy feeling of hunger; and if we could imagine a man coming into the world with the full possession of all his faculties, we may feel tolerably certain that he would not wait to eat until he had learned by experience his dependence upon food.'

Some recent utterances on the *automatic doctrine* of animals appear to have confused in a singular manner the faculties which man exhibits in virtue of his intelligent consciousness, and those which the lower animals exhibit in virtue of their lower instincts alone. That many acts in man are of automatic or instinctive and unreasoning character cannot be denied; but this admission is by no means tantamount to the assertion that *all* human acts are such. It may even be rationally supposed that the intelligence and consciousness of man has arisen gradually out of the original automatism of his nature; just as the infant, as it grows, gradually acquires through experience the knowledge and consciousness of its own existence and of its surroundings. But from the analysis of our own mental acts we conclude that we not only possess a conscious intelligent knowledge of ourselves, but that through this intelligence we possess the power of specially adapting the acts of our lives to whatever circumstances may from time to time arise and affect us. It is unquestionably in this latter phase of their character that human acts differ most typically from the mere *instincts* of lower animals. The chief characters of purely instinctive acts may be briefly summarised as consisting (1) in their marked *uniformity* and *unvarying repetition*

in and by the individuals of the species which exhibit them; (2) in their being performed under such circumstances (as when a *newly-born* ant or bee enters at once on the performance of all its duties) that the idea of *experience* is completely negatived; (3) by their being performed under circumstances strongly suggestive of the *absence* of adaptive intelligence, as, for example, 'when a tame beaver attempts to build its dam across a room, or when bees attempt to make a new *queen* out of a drone (or male) larva.' The operations of intelligence and reason, on the contrary, are not only performed with a *purposive character*, but are susceptible of *gradual improvement* under the tuition of experience.

In'stitute a term of Scotch entail law denoting the person first in the destination. Those that follow are called *substitutes*.

In'stitute of France, a corporative body comprising the five great scientific and artistic societies of Paris, is a lineal descendant of the French Academy, founded with forty members by Richelieu, 25th January 1635, for the cultivation of the language generally, and the special work of preparing a (hitherto, 1877, unfinished) dictionary. The French Academy, with the affiliated Academies of Fine Arts (1648), Sciences (1666), and Inscriptions (1701), was suppressed at the Revolution by the Convention, 8th August 1793, and replaced under the Directory, 25th October 1795, by the National Institute, which, consisting of 144 members, was divided into the three classes, physics and mathematics, literature and fine arts, morals and politics. Of these classes, the last was abolished, and the two first broken up into four, by Napoleon, 23d January 1810; whilst with the Bourbon restoration came the re-establishment of the four ante-revolutionary academies, which, increased to five by the addition of an Academy of Morals and Politics, 26th October 1832, have ever since constituted the I. of F., its prefix only—Royal, National, or Imperial—varying with the corresponding changes in the form of government.

In its present form, then, the Institute consists of (1) the French Academy with 40 members, an annual State grant of 85,000 francs, prizes for eloquence and history of 4000 francs, the Montyon prize for virtue of 20,000 francs, and the Gobert history prize of 10,000 francs; (2) the Academy of Inscriptions and Belles Lettres, with 40 ordinary, 10 honorary, 8 foreign, and 50 corresponding members, and a second Gobert history prize; (3) the Academy of Sciences, having 65 ordinary, 10 honorary, 8 foreign, and 100 corresponding members, and eleven prizes, several of them of 10,000 francs apiece; (4) the Academy of Fine Arts, with 40 ordinary, 10 honorary, 10 foreign, and 40 corresponding members; and (5) the Academy of Morals and Politics, which has 40 ordinary, 6 honorary, 6 foreign, and 40 corresponding members. Thus, in all, there are 225 ordinary, 36 honorary, and 230 corresponding members, with 32 foreign associates. In the list of foreigners connected with the Institute occur the familiar names of Herschel, Faraday, Hamilton, Max Müller, and Grote, while of its French members may be mentioned Ampère, Arago, Gay Lussac, Thiers, Michelet, Gerôme—all, indeed, that are most distinguished in French literature, art, and science of the present century. The Institute holds two public sessions weekly, on Monday and Friday, at 3 P.M., in the Palais de l'Institut, opposite the Louvre.

In'stitutes, the name given to the treatise on the principles of Roman Law (q. v.) drawn up in the reign of Justinian (q. v.).

Institu'tion, in church law, is the ceremony by which a bishop commits to a clerk who is presented to a church living the spiritual welfare of its people.

In'strument is a semi-technical term in the law of England denoting a testamentary writing, and sometimes it is used in a wider sense. In Scotch law it is usually applied to notarial documents.

Instrumenta'tion, the art of using several musical instruments in combination, or of writing appropriately for the 'Orchestra' (q. v.). See Berlioz's *Modern I. and Orchestration* (Lond. 1858).

Instruments, Musical, are of three classes—(1) stringed I.; (2) wind I.; (3) I. of percussion. In the first class the strings may be touched by the fingers (*e.g.*, harp), by a bow (*e.g.*, violin), or by hammers (*e.g.*, pianoforte). The organ, trumpet, oboe, and flute are representative examples of the second class; the first has bellows and keyboard, the second is of brass, the third has reeds, the fourth has no reeds. The drum is an instrument of percussion.

Insurance, Life. Insurance, as a prosperous business, did not to any large extent exist before the 19th c. It has now become for the upper and middle classes almost as great an institution as the benefit societies of the lower classes. It is used not merely as a family provision, but as a security in loans. It is also the easiest and safest method of saving money. The business is carried on by—(1) Mutual societies, of which the members insure one another, a guarantee fund being formed, and the whole surplus profits going to increase the value of the policies; (2) Proprietary companies, of which the shareholders give to the public the security of their subscribed capital, and are therefore entitled in the first place to the profits. But competition has caused most proprietary companies to give a large share of the profits to the policy-holders, who therefore in many cases secure not merely an insurance against risk, but a very profitable investment. As an Act of 1870 requires a deposit of £20,000 from new companies, it is unlikely that more mutual societies will come into existence. There are many varieties of L. I. business. The Tontine principle was a scale of benefits varying with the age of the policy. Most companies offer a choice of rates for participation or non-participation in profits; and the premium, or consideration given by the assured, may be paid in many different ways. In all cases, however, the contract is only renewable annually, and the company does not undertake to continue its business beyond the year. The liability is to pay only on death, but a small surrender-value is usually given when A, who has paid a certain number of premiums, wishes to drop his policy. The huge failures of the Albert and the European, caused by reckless amalgamation, have called public attention to the financial principles of L. I.; and under an Act of 1870 the companies are obliged to return to the Board of Trade certain accounts which are supposed to test their solvency. In the premiums charged there are three elements: the pure risk, the rate of interest on investment, and the loading for expenses. Even as regards the first two, the practice is various. The chief tables, or tabulated results of mortality, on which the calculation of risk has been based, are the Carlisle, the Northampton, the seventeen offices' experience, and the recently published experience of the Institute. Each company adjusts its theoretical expectation of life to its own experience. The results are no doubt in some degree temporary and local, but, together with a careful selection of lives, they are enough to make L. I. the safest of all businesses. The reports of the Registrar-General are of great use in determining the special risks which are accepted at special rates. The interest allowed for in the premium may be 3, 3½, or 4. It is in the matter of expenses of management and excessive commission to agents that the most discreditable features and the greatest varieties of L. I. occur. Commissions to solicitors and other persons not insurance agents is simply a robbing of the public. Comparative freedom from this was one element of strength in the mutual companies. A fair test of the soundness of an office which has been in existence for some years is to observe the percentage which working expenses bear to premium income. It was excessive expenditure that led to foolish amalgamation, by which women and aged persons often found that their solvent debtor had disappeared without notice, leaving an insolvent substitute behind. By an Act of 1872, however, the public are so far protected that 'novation' will now be held not to have taken place where an agreement to that effect has not been signed. Little requires to be said of the legal aspects of the familiar contract of L. I. It is not a contract of indemnity, but it is one in which the most exuberant good faith is required from both parties. Obviously, it depends on a true disclosure of health, age, profession, and every other circumstance which materially affects the risk.

Accident Insurance has very recently become a large business. 'Millions of people cannot afford to be run over;' and the leading feature of this business is to insure against complete or partial disablement through accidental causes, against which the assured could not reasonably protect himself, and to which he has not contributed by acting illegally or negligently. Very various classifications of professions and trades, as more or less hazardous, are used. Special policies for railway accidents are

issued, and the risk of death is often included. Injuries due to somnambulism, intoxication, or inflicted by other persons, are generally excluded.

Marine Insurance was in its primitive form merely a loan or advance, repayable on safe arrival, the *fœnus nauticum* (12 per cent.) of the Roman Empire escaping the rules of the Church against interest. This is seen in the *Bödemerey* of the *Recessus* of Lübeck; indeed, bottomry seems to be of Hanseatic, not Mediterranean, origin. The first regular Chamber of Assurance is mentioned as at Bruges in 1310 by the *Chronyk van Vlændern.* In England, probably a system of mutual guarantee prevailed among the Easterlings of the steelyard; the famous Act of 43 Eliz. c. 12, erecting a special court to try M. I. cases, speaks of the policy as an immemorial usage. Premiums of insurance, 'preus de seguretats,' are traced in 1435 at Barcelona, where over-insurance, 'valegnen mes o menys,' is prohibited, and also the insurance of foreign vessels. At Venice, in 1468, the Pregadi denounce deck-loading under severe penalties. At Florence *scritta* or underwriting was supervised by public *deputati*, and *sensali*, or brokers. It was undoubtedly the Lombards, the 'Pope's merchants' in London, who introduced to England the word *polizza*, or promise, and the phrase till lately used, 'In the name of God' (Dio la Salvi). Every policy issued at Lloyd's still refers to Lombard Street. From the *Guidon de la Mer* (Rouen, 1590), it appears that unwritten insurances, called 'confidence bargains,' were at one time the rule. The spread of M. I. in England was hindered by 'Cauder's patent,' a monopoly granted by Elizabeth, which threw 120 notaries-public out of work. Among the 'Kauphy' houses of London in the 17th c., which gave an impetus to the business, was that of Edward Lloyd in Tower Street, and afterwards in Lombard Street, described in the *Tatler* and the *Spectator.* In 1696 *Lloyd's News* was started for six months, to reappear in 1726 as *Lloyd's List*, both being summaries of commercial intelligence. The miscellaneous auction pulpit at Lloyd's was gradually restricted to the shipping trade, and it became a meeting-place for underwriters. In 1720 Speaker Onslow and Lord Chetwynd obtained by payments to Exchequer the charters of the 'London Assurance Corporation' and the 'Royal Exchange Assurance Corporation.' This monopoly against insurance partnerships was said to be required from the frequent failures of private insurers. The underwriters retained about nine-tenths of the business. The *List* was published twice a week; the early entries from Greenock are fifteen days after date. About 1770 gambling insurance on public events having become very common, the underwriters acquired the property of the *List*, and shortly after, under the leadership of J. Augerstein, removed to the Royal Exchange, where they founded New Lloyd's. In 1786 appeared the work of Park summing up the judicial decisions of Lord Mansfield, who had now elaborated the distinction between valued and open policies, the prime cost being expressed in the former, voyage and time policies, warranties of seaworthiness and representations, particular and general average, &c. There is no branch of law in which sound common sense and the usage of trade have had a larger share in determining. The policies were generally 'warranted free from average, except general or the ship be stranded,' but by an Act in 1746 open-water policies, 'interest or no interest,' were prohibited. In 1779 the present printed form of policy was adopted by New Lloyd's. The American and French wars made insurance much more general, and Lloyd's was recognised by the Government as superintending the despatch of convoys, and consulted for news and with regard to commercial treaties. In 1802 Lloyd's distinguished themselves by founding the Lifeboat Institution, and next year they started the Patriotic Fund by a subscription of £20,000. From the evidence given before a committee in 1810 it appeared that M. I. was very profitable, but that the underwriters dealt very liberally with respectable merchants. This committee considered the question of repealing the monopoly of 1820, but this was not done until in 1824, when Nathan Rothschild, Montefiore, and Gompertz got an Act incorporating the 'Alliance.' Attention was called in 1810 to the imperfect laws punishing insurance frauds, which, though Walpole in 1725 had extended them to barratry against the writers and by the owners, still permitted the owners to recover on the policies. The case of Captain Codling in 1802 had revealed an immense amount of systematic scuttling, and it was stated that one-third of insurance claims were fraudulent. The 'Alliance' was followed by the 'Indemnity' and the 'Marine,' the latter of which in 1867–69 paid dividends of 44 per cent. The Limited Liability Acts brought many more into existence, and the American War gave them artificial profits for several years. The recent history of the trade is contained in *The Underwriting of 1872*, by Mr. Danson, Liverpool. Lloyd's had a ship's list or registry as early as 1730. In 1780 the appointment of surveyors is traced. The classification was so strict that for thirty-four years the shipowners had a rival register called the *Long Shore Book*, a very worthless production. In 1834 both this and Lloyd's *Old Book* were merged in *Lloyd's Register of British and Foreign Shipping*, which is managed by a committee of merchants, shipowners, and writers (twenty-four of London and fifteen from the chief outposts), and employs fifty-two surveyors in the United Kingdom and fifty abroad, and is represented by 1200 agents. The income from survey fees and sale of registers is £40,000 per annum. There are five classes of wooden ships: viz., A (black), A (red), Æ, E, I. Iron vessels are certified as $\underset{A}{A}$, $\underset{B}{A}$, $\underset{C}{A}$. About one-half of British vessels are placed in the register, and one-half of that number (or 8000) are classed, the rest being expunged, expired, or without character assigned. There is a French Lloyd's, called Bureau Veritas, managed by M. Bal, which grants certificates much more easily. The English Lloyd's, consisting of 710 members, was incorporated by statute in 1871. The M. I. companies subscribe for information, on which more than £10,000 per annum is spent. The index showing the precise whereabouts and character of a ship, and the 'captain's register,' giving a sketch of each officer, are marvels of skilful arrangement constantly revised. The rates of premiums for the great ocean routes depend on the time of year, on an analysis of the wreck registers of the Board of Trade, and on the cargo and character of the ship.

Fire Insurance has been traced back to 1667, when the 'Fire Office' issued policies in London. Shortly after the great fire the corporation of London undertook the business. The sixpenny stamp was imposed in 1694. Before this there existed a practice of asking compensation for fire by fire briefs issued by the Chancellor to a particular locality. On the Continent, just as fire, water, and robbery were provided against by the ancient gilds, so in the customary laws which succeeded them (notably in the Cora or Customs of Furnes, A.D. 1240) special notice is taken of fires. Quite recently the experiments of compulsory state and municipal F. I., carried out in Zurich, Denmark, and Poland, have been very seriously discussed in the United States. During the 18th c. the rule seems to have been to insure three-fourths value only. In 1776 Adam Smith observed that only one house in 100 was insured against fire. In 1802 Sir F. M. Eden estimated the insurable property in the United Kingdom at 612 millions. Braidwood's *Fire Engine*, &c., published at Edinburgh in 1830, gives local statistics of some interest. Porter in his *Progress of the Nation* shows that in the first half of the 19th c. the sums *insured* increased 210 per cent.; the total in 1867 being 722 millions. About the same time Mr. Samuel Brown made the first serious effort in the statistics of the subject, and found that in 100 cases, buildings and contents were insured in 37, buildings only in 15, contents only in 14, and neither in 33. The London Fire Brigade Records, published in 1870, show the principal causes of fire very minutely, the chief being—candles, 11 per cent.; curtains, 9 per cent.; flues, 7 per cent.; gas, 7 per cent.; sparks of fire, 4 per cent.; unknown, 32 per cent. The fires from unknown causes are naturally the more destructive, and they visibly increase as trade becomes depressed. In 1869 the *percentage* duty was wholly abolished. In 1872, the fire premiums received by twenty-six British offices amounted to £5,297,762; their losses to £3,722,504; and in 1874 the business done in London alone reached the sum of £540,000,000. The contract of F. I. is one of indemnity, and the insurer may either restore the property or pay the fair value. As a general rule, rent and profits are not insured, but floating and blanket policies are common; they cover the excess beyond specific policies, wherever the goods may lie. Misstatement of value vitiates a policy. The difficult question of adjustment between these policies are treated in *The Average Clause*, by Mr. Atkins, published 1866. Generally, also, goods held in trust or commission are excluded, and special rates charged for valuables and dangerous localities. Other subjects of indemnity insurance are cattle, glass, steam-boiler, carriage, &c. In hail insur-

ance the principle of consequential damages is admitted. Fire business is done by companies: there is only one private fire underwriter in the world, viz., Mr. Wheeden of Baltimore, U.S.

Intaglio (pron. *intalyo*, Ital. 'an incision') denotes engraved work sunk into a gem, as distinguished from work in relief. (See CAMEO.) The cylindrical seals of the Assyrians exhibit the earliest known work of this kind. The ancient Greeks and Romans produced *intagli* of great beauty in abundance, and set them in signet rings. The artists of the Renaissance, and more recent periods, executed their work on a larger field than the ancient gem-engravers.

In'tegral Cal'culus and **Integra'tion.** See CALCULUS.

In'tellect. See MIND.

Intem'perance means, in a general sense, want of moderation or due restraint, and hence, appropriately and emphatically, habitual indulgence in spirituous liquors, with or without intoxication. Spirituous liquors are obtained from a variety of sources in different parts of the world, and are in general use in most countries. The *arrack* of the Hindus and Malays is obtained from rice or areca-nut; the *raki* of the Greeks and Turks, from rice; the *toddy* of the Hindus, from the cocoa-nut; the *bojah* of the Mahrattas, and the *murwa* of the Sikkim, from eleusine corocana; the *samshoo* of the Chinese, and the *sdcie* of the Japanese, from rice; the *kawa* of the Pacific Islanders, from macropiper; the *pulque* of the Mexicans, from agave; the *chica* of the S. Americans, from maize; the *koumiss* of the Tartars, from mares' milk; the *vodki* of the Russians and Poles, from potato; the *tallah* of the Abyssinians, from millet; and the *alcoholic stimulants* in general use among European nations, from a well-known variety of sources. Probably the sole reason why alcoholic stimulants are in such general use consists in the hilarity produced as an immediate effect. The agreeable exhilaration which follows their use is, however, transient in its nature, and, in order to keep it up, repeated doses must be taken, eventually resulting in I., and the formation of a morbid appetite or craving for stimulants. Until recently, science sanctioned the belief that alcohol is a food, which, in the advancing stages of civilisation, becomes more requisite than ever; but investigation now shows that it is only entitled to a place among the *luxuries*, and not among the *necessaries* of life. The physiological and medicinal action of alcohol has been discussed under *Alcohol* (q. v.); but it is a matter of the highest importance to determine when the extreme limit of the useful effect of alcohol is reached. On the supposition that the appearance of alcohol in the urine is a sign that as much has been taken as can be disposed of by the body, and that this indicates the commencement of the poisonous stage, manifested by narcosis, loss of appetite, increased rapidity of the heart's action, and dilatation of the small vessels, Drs. Anstie and Parkes and Count Wollowicz ascertained, by a series of rigid experiments on powerful healthy men, accustomed to the use of alcohol, that the extreme limit of the useful effect is produced by some quantity between 1 and 1½ fluid ounces in twenty-four hours. The experiments were not intended to show that the daily use of alcohol to this amount was necessary or even beneficial, but to mark the limit beyond which the use of alcohol was positively injurious, or the extreme boundary line between temperance and intemperance. Dr. B. W. Richardson recently made a series of elaborate scientific researches on alcohol which he summarises as follows:—'I learned purely by experimental observation that, in its action on the living body, this chemical substance, alcohol, deranges the constitution of the blood; unduly excites the heart and the respiration; paralyses the minute blood-vessels; increases and decreases, according to the degree of its application, the functions of the digestive organs, of the liver, and of the kidneys; disturbs the regularity of nervous action; lowers the animal temperature; and lessens the muscular power.' The results of the purely scientific researches of Drs. Parker, Anstie, and Richardson are strikingly confirmed by experience. No one can entertain a moment's doubt that the effect of I. in any alcoholic beverage is to cause premature old age, to predispose to, and result in, organic diseases which greatly shorten life; but very remarkable evidence in support of the scientific deductions of Dr. Richardson is given by the statistics of the United Kingdom Temperance and General Provident Institution. One section consists of abstainers, and another of persons selected as not known to be intemperate. The claims for five years (1860–70) anticipated in the temperance section were £100,446; but there were actually only claims for £72,676. In the general section, the anticipated claims were £196,352 and the actual claims were no less than £230,297. The amount of bonuses paid to each £1000 whole-life policy in the two sections for the same five years shows the much greater longevity of the abstaining section, and demonstrates that at every age at entrance the abstainer has a very great advantage, even over those who, though not intemperate, use alcohol in what is called moderation. The section of non-abstainers showed a mortality of 7 per cent. below the calculated average of life, and from bonuses of premium paid received 34 per cent.; but the section of abstainers showed a mortality of 26 per cent. below the average, and received from bonuses 53 per cent. In regard to the administration of alcoholic stimulants in *sickness*, Dr. Parkes says, 'I believe they are often of great use, although, like many other strong medicines, they require to be given carefully. The fashionable plan of giving great quantities of strong spirits is happily dying out, and is being replaced by a more careful practice.' Sir Henry Thomson says, 'As with many other medicines, its employment is apt to be greatly abused, and thus wine or spirit is taken when not in the least degree necessary, often when it is absolutely injurious; for people who enjoy tolerable health, but nevertheless find *digestion slow* or *imperfect*, or *the circulation languid*—popular forms of excuse for taking wine—it seems to me more frequently a dangerous snare than a tolerable remedy.' See *Practical Hygiene*, by Dr. Parkes (Lond. 1873); *Medical History of the War in the Crimea*, by Sir John Hall (vol. i.); *Physiology of Temperance*, by Dr. Carpenter; *Degenerative Changes induced by Alcohol*, by Dr. Dickinson (*Lancet*, November 1872); *Diseases of Modern Life*, by Dr. Richardson (Lond. 1876); and a *Course of Six Cantor Lectures*, delivered before the Society of Arts, by Dr. Richardson. See also articles on ALCOHOL, DELIRIUM TREMENS, and DIPSOMANIA.

Inten'dant (Lat. *intendens*, 'attending to'), one who has the oversight of some special department, as I. of Marine, I. of Finance, &c. In France, before the revolution of 1789, the Intendants of the provinces answered to the modern Préfets (q. v.). They dated from the 16th c., but owed their definite organisation to Richelieu (1636). At present the name *Intendants Militaires* is applied to an administrative corps which superintends the commissariat, pay, quarters, &c., of the troops in the field. It was established July 29, 1819, and consists of an I.-in-chief, 28 intendants, 140 sub-intendants, and 80 adjutants.

Inter'calary Day, in the calendar, is a day inserted at certain periods to keep the civil year approximately coincident with the solar year. The 29th of February, which is inserted every fourth or *leap* year, is of this character.

Intercess'ion of Christ with God for sinners, in theological language, is the exercise of his priestly office, in which he is engaged for ever at the right hand of the Father. Man's need of an intercessor arose from his loss of the right of communion with God by the Fall, a privilege which was restored in Christ, who was constituted our high priest by the union of his divine and human natures, the latter furnishing both priest and victim (Heb. iv. 15, vii. 25, ix. 14). It is held by Roman Catholics, as well as certain other Christians, that saints in heaven are to some extent partakers with Christ in this work of I. See INVOCATION OF SAINTS.

Intercolumnia'tion (Lat. *intercolumnium*, from *inter*, 'between,' and *columna*, 'a column'), the space between two columns of a building, which, among the ancients, might be of various extent—either aræostyle, 4 diameters of the shaft of the column; diastyle, 3; eustyle, 2¼, the favourite width; systyle, 2; or pyknostyle, 1½.

In'terdict (Ecclesiastical). See EXCOMMUNICATION.

Interdict, in Scotch law, is an order of the Court of Session, or of an inferior court, to prevent an illegal act or to stop illegal procedure. The applicant for an I. must show a title and prove that he has an interest in the act or procedure complained of. The similar remedy of English law is Injunction (q. v.).

Interdic'tion is, in Scotch law, a system of judicial restraint, provided for those, legally speaking, of facile nature. (See

FACILITY.) The remedy may be had at the instance of the facile person himself, or it may be procured against his wish at the instance of a near kinsman. In the latter case, it is called *judicial I.* In both cases the effort is to appoint trustees, whose consent is necessary to the validity of any deed affecting the heritable estate of the imbecile.

In'terest is the sum of money paid for the loan or use of another sum, generally estimated at so much *per cent.*, or per £100. The sum for which the I. is paid is called the *principal*, and the I. upon a hundred is called the *rate.* The I. is further proportional to the time, so that whatever is paid for £100 for one year, double that amount is paid for two years. The principal and I. together make the *amount*, and this is the whole sum which is paid back to the lender. I. is either simple or compound. The former is reckoned upon the principal only, however long the period over which the loan extends; the latter is reckoned not only on the principal but also upon the I. as it becomes due. Thus, suppose the I. per annum upon a £100 to be £5, then, reckoning at simple I., the whole amount after ten years will be £150. At compound I., however, the I. for the second year is not, as above, £5, but is £5, 5s., being the I. charged upon £105, which is the original principal together with the first year's interest. Representing the principal by P, the annual rate per cent. by r, the time by n, and the I. by I, the relation between these at simple interest is evidently

$$P \times \frac{r}{100} \times n = I, \text{ or } Prn = 100\ I,$$

from which, if any three are given, the fourth may at once be found. If the reckoning be at compound I., the formula is more complicated. At the end of the first year, the interest $= P \times \frac{r}{100}$, and the principal then becomes $P + P \times \frac{r}{100} = P\left(1 + \frac{r}{100}\right)$. At the end of the second year, the I. is accordingly $P\left(1 + \frac{r}{100}\right) \times \frac{r}{100}$, and the amount on which to reckon for the ensuing year is

$$P\left(1 + \frac{r}{100}\right) + P\left(1 + \frac{r}{100}\right) \times \frac{r}{100} = P\left(1 + \frac{r}{100}\right)^2.$$

Similarly the amount at the end of the third year is $P\left(1 + \frac{r}{100}\right)^3$; and that at the end of the ninth year is $P\left(1 + \frac{r}{100}\right)^9$. As an example, any sum of money put out at five per cent. compound interest, would nearly double itself in fourteen years. This is equivalent to saying that $\left(1 + \frac{1}{20}\right)^{14}$ is nearly equal to 2.

Law Regarding Interest of Money.—The statute of 12 Anne, c. 16, made five per cent. the legal interest in Great Britain, describes usury, then a crime, imposes penalties upon it, and declares the contract null. By 17 and 18 Vict. c. 90, all acts against usury were repealed. This Act, however, declares that the expressions *legal* or *current* rate of interest shall mean the same as formerly. It is also declared that the laws as to pawnbrokers are not affected by the new Act. (See PAWNBROKING.) Interest may be due *ex lege;* that is, by the act of the law, as is the case of bills of exchange, which bear interest from their date of falling due, or it may be due under agreement. In the latter case, the rate at which interest falls to be charged depends wholly on stipulation. Legal interest is five per cent. The law hardly ever awards compound interest—or interest with *annual rests*, as it is often called in the law of England—to any one.

Interfe'rence of Light is the name given to a class of remarkable optical phenomena, of which the most striking is the production, under certain circumstances, of darkness by the coming together of two rays of light. The explanation which the undulatory theory affords of this phenomenon is so simple and beautiful as to carry with it, to the appreciative mind, the irresistible conviction that light travels in waves through the ether or space-pervading medium. Imagine a lake of water stretching indefinitely in all directions, and let a stone be dropped in from above. A series of concentric circular waves will be propagated from that point as centre where the stone struck the surface. This is very analogous to the propagation of light through the ether, except that the light waves form concentric spheres and not circles, and the particles of ether vibrate in *all* directions tangential to the spherical surface, and not merely in *one* direction as the up-and-down vibrating water particles do. If two series of equal waves meet at a point such that crest coincides with crest and trough with trough, the result will be a series of waves, each of which has nearly twice the amplitude of either of the constituents, if the latter are small. But if they should meet so that trough coincides with crest and crest with trough, the result will be a dead level or no wave motion at all. Consider, then, two series of waves of equal length diverging from two centres. For all points whose distances from these centres are equal, or differ by any whole number of wave-lengths, crest will come with crest and trough with trough, and increased brightness will result; while for all points whose distances differ by half a wave-length or by any odd multiple of half a wave-length, crest and trough will coincide and darkness will ensue, since darkness is merely the *absence* of the vibrations which constitute light. In the former case, the waves are said to meet in the *same phase;* in the latter case, they meet in *opposite phases.* Consequently wherever circumstances are such that two series of waves meet in opposite phases, the phenomenon of darkness produced by two lights will take place. A very instructive experiment is that devised by Young, to whom we owe the first complete explanation of the phenomena of interference. Light is allowed to diverge from two minute apertures and fall directly upon a plane screen, which is perpendicular to the axes of the two luminous cones; all points in the screen which are equidistant from the two sources of light will be luminous, and similarly for all points at which the waves from the two sources meet in the same phase. These points will appear arranged along bright bands, which form hyperbolas with the exception of the rectilinear band formed in the centre, and which are separated by dark spaces. The points along the central line of these dark bands are those points at which the waves of light meet in opposite phases. The alternation of distinctly-marked bright and dark bands, or fringes, as they are called, is only possible when homogeneous light is used. When white light is employed, the fringes will be coloured bands, which, after a few successions, are effaced by the overlapping of the fringes of different colours. An application of the same principles of wave interference has accounted for many more complex phenomena, into which it is impossible here to enter. A special set of interference phenomena is considered under DIFFRACTION, and a fuller treatment of the first principles of the undulatory theory will be found under LIGHT. The best English elementary treatise on the subject is Lloyd's *Wave Theory of Light*, to which the reader is referred for a complete elucidation of this branch of physical science.

In'terim (Lat. 'in the meantime') was the name given to certain documents drawn up in connection with the scheme of the Emperor Karl V. to conciliate the Lutherans, and make it possible for them to remain in the Church till a general council should assemble to settle the matters in dispute. The first I. was discussed at a conference held at Ratisbon (1541) between Eck, Pflug, and Gropper on the one side, and Melanchthon, Bucer, and Pistorius on the other. The second I. was drawn up by order of the Emperor, and discussed at the Diet of Augsburg, 1548; but, giving satisfaction to neither party, it was repealed in 1552. The third I. was a document embodying the opinions of Melanchthon and the other divines convened at Leipsic (1548) by Moritz, Elector of Saxony, to consider the I. of Augsburg.

Interjection (Lat. *interjectio*, from *inter*, 'between,' and *jacio*, 'I throw'), a word expressing a sudden passion or emotion of the mind. It is not so much the expression of a thought as the interruption of the sequence of thought, and as being a mere exclamation, it does not stand in grammatical relation to any word in the sentence in which it occurs. The I. is thus the lowest form of speech, and is nearly allied to the sounds emitted by the lower animals, *e.g.*, the bark of the dog, the grunt of the pig, &c. Many of the interjections in English are abbreviated forms of phrases or sentences. Such are Good-bye! = God be with you; Adieu! = I commend you to God; Marry! = by Mary (the Virgin). Many adverbs, prepositions, verbs, &c., are used as interjections. In written speech the I. or the clause in which it occurs is followed by the sign (!).

Interlak'en ('between the lakes'), a beautiful Swiss village in the canton of Bern, on the low land called *Bödeli*, between the lakes of Thun and Brienz, which are 2 miles apart. A double avenue of walnuts lines the Höheweg, which is flanked by hotels, and extends from the adjacent village of Aarmühle to the upper bridge over the Aar. Pop. 1896. I. is noted for its whey-cure. It is a great centre for excursions into the Bernese Oberland, of which there is a magnificent view to the S.

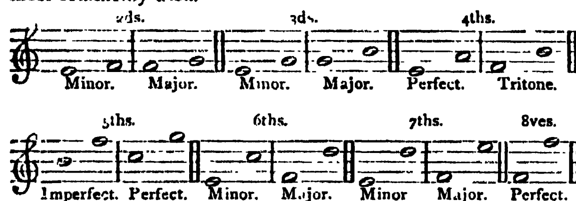
Interlinea'tions in a deed are, legally speaking, additions or corrections, whether literally so or written on the margin. The initials or signature of the granter of the deed should be written across the I., and in Scotland the fact should be mentioned in the testing clause. An I. not properly executed is not, if unimportant, fatal to a deed; but it is very desirable either to avoid correction, or to have it properly executed. See ERASURE, ILLEGIBILITY.

Interloc'utor, in Scotch law, means the judgment of a law court. The word is not used in English law; but in both countries the term *Interlocutory decree* is used to denote a judgment which is not final, but is merely a step in the case.

In'terlude, Intermezz'a (mus.). A short movement played between the acts of a drama, or between certain portions of a church-service.

Intermitt'ent Fever. See AGUE.

Interna'tional, The, a cosmopolitan association of trades unions, which has spread its ramifications throughout Europe, and whose primary principle was not political but social revolution, was organised at London in 1862, the year of the International Exhibition, 'to establish common interests among the working classes in different countries of the world.' At a meeting attended by delegates of ten nationalities, held at St. Martin's Hall, London, September 28, 1864, under the presidency of G. Odger, a new character—that of political action—was imparted to the society by its voting the publication of the revolutionary statutes and manifestoes of Dr. Karl Marx, whose programme of administration was finally adopted, in preference to those of Mazzini and Bakunin, at meetings held in the four following years at Geneva, Lausanne, Brussels, and Basel. In 1868 the French branch of the I. was prosecuted by the Government, the names of Assi, Duval, and nine other leaders of the subsequent Paris Commune first emerging in the course of this trial. Among the avowed aims of the advanced members of the I. at this period should be noted the abolition of marriage, religion, and inheritance, and the constitution of land as collective property; while its workings were shown in the support of the Paris bronze-workers in their strike of 1867, and of the Geneva builders in 1868, by English trades unions, the latter in turn being upheld in their strikes by the prohibition on the part of the I. against the importation of cheap labour into England from the Continent. With the struggle of the Paris Commune in 1871, the I. may be said to have at present culminated. At a meeting held at the Hague, September 4, 1872, Marx, the president, denounced Favre as a wretch and Trochu as a traitor, and a resolution was passed expressing 'admiration for the heroism of the champions who have fallen for the rights of the people,' and sending 'a greeting to all those who are still in chains.' Still, these sentiments failed to find favour with a large body who desired simply an international trades union, while the leaders were bent on political revolution in their own communistic sense, and two days later the congress broke up in dissension, the English, Swiss, Spanish, and Italian delegates forming a European confederation apart from the extreme section, which, under Marx and the French Communists, has transferred its headquarters from London to New York. Except in Spain, where in 1873 Internationalist revolts broke out in Murcia, little has been heard during the last five years of the society. Its members are stated to be still on the increase in Europe; but in America, though possessing branches in most of the large cities, the I. cannot be said as yet to command a numerous or influential following, only 2000 persons taking part in the 'demonstration' held at New York, December 17, 1871. See Onslow Yorke, *The Secret History of the I.* (Lond. 1874).



International Law. The term I. L. is, strictly speaking, a contradiction, for the common analysis of law implies not only a command or prohibition, but a sovereign power capable of enforcing this on subjects. Did such an authority exist, the law if enforced would then not be international, in the sense of applying to the relations between completely independent sovereigns, for a part of sovereignty would have been surrendered. I. L. may, however, be most usefully defined as certain rules which have been generally adopted by Christian States in their intercourse with one another. The practice of a few States is not sufficient to support a rule, and the practice between less civilised races, or between superior and inferior (*e.g.*, England and China) is generally left out of account. In the Amphictyonic Council of Greece and the *Jus Fetiale* at Rome there is nothing answering to modern I. L. except in so far as the latter treats of the rights and ceremonial usages of heralds or ambassadors. In medieval times the Pope exercised a species of international jurisdiction, for which his power of dispensing with the performance of solemn obligations must have been very useful. Many points were discussed by Suarez, Ayala, and Albericus Gentilis, but the system of I. L. was first generally stated by Grotius in the beginning of the 17th c. Since then a great literature has appeared, in which two schools are most conspicuous—(1) Those who, like Puffendorf, and many German and French writers, endeavour to develop *à priori* the jural relations of States, their definitions of rights and obligations being for the most part borrowed from individual morality; (2) those who, like Grotius, the eminent American writers Wheaton and Keat, and the English writers Twiss and Phillimore, content themselves with tracing the limits and the principles which seem to be involved in historical precedents of comparatively modern date. Several plans have been suggested to supply an umpire or authority who should both ascertain and enforce the law, which is in a very uncertain state. Such were St. Pierre's *Projet de Paix Perpetuelle* (1729), which consisted in a perpetual league of the European States, having in all, singly or in groups, twenty votes, the right of war being renounced, and a vote of three-fourths being conclusive; Bentham's plan of a general congress (1789), which included the renunciation of colonies, reduction of armaments, and the furnishing of a contingent to enforce the congress decrees; Kant's plan, expressed in his essay *Zum Ewigen Frieden* (1795), for the abolition of standing armies, universal republican institutions, and world citizenship. (See also Ladd's Prize Essay on a Congress of Nations, for the American Peace Society, Boston, 1840.) This idea is still cherished by the amiable *savans* of the 'International Law Congress,' established at Ghent in 1873. In the present condition of the world its realisation would obviously afford opportunities for oppression. Among recent instances of international arbitration, one of the most important was that between the United States and Great Britain for the settlement of the disputed claims arising out of the depredations of the *Alabama* (q. v.) and other Confederate cruisers built and sent from England during the civil war. The arbitration was preceded by a joint high commission of the two Governments, by which the treaty of Washington was negotiated, arranging for an arbitration at Geneva, to proceed according to certain fixed rules of neutrality. The arbitration was followed in 1873 by a vote in the House of Commons, by which it was resolved 'that an humble address be presented to her Majesty praying that she will be graciously pleased to instruct her principal Secretary of State for Foreign Affairs to enter into communication with foreign powers with a view to further improvement in I. L., and the establishment of a general and permanent system of international arbitration.' A conference on the subject of I. L., attended by representatives from America, England, France, Germany, Italy, Spain, Switzerland, Belgium, and Holland, was held at Brussels, 10th October 1873. From the literature of the whole subject we select:—Robert von Mohl, *Geschichte und Literatur der Staatswissenschaft* (3 vols. Erlangen, 1855-58); Laurent, *Histoire du Droit des Gens* (Ghent, 1850); Pardessus, *Collection des Lois Maritimes Antérieures au 18ème Siècle* (6 vols. Par. 1828-45), including the *Assises des Bourgeois du Royaume de Jérusalemme*, the *Jugements d'Oleron*, and the *Jugements de Damme*, the *Consolato del Mare* (composed at Barcelona), the Sea Code of Wisby, the *Guidon de la Mer*, the laws of the Hanseatic League, and the famous French *Ordonnance Maritime of* 1681; De Martens, *Recueil des Principaux Traités de Paix*, which has been continued in various supplements; Koch, *Abrégé de l'Histoire des Traités de Paix* (recast by Schöll, 15 vols. Par. 1818); Emmerich de Vattel, *Droit des Gens* (published at Leyden, 1758; best edition by Pinheiro-Ferreira, Par. 1838); De

Martens, *Précis du Droit des Gens Moderne de l'Europe* (Gött. 1789; edition by Pinheiro-Ferreira, Par 1855); Heffter, *Das Europäische Völkerrecht der Gegenwart* (3d ed. Berl. 1855). The best work on the consular service is De Miltitz, *Manuel des Consuls*, 1843; on private I. L., Fœlix, *Traité du Droit International Privé* (3d ed. Par. 1856); and the eighth volume of Savigny's *System des Heutigen Romischen Rechts* (translated by Guthrie); Prof. Bluntschli, *Modernes Völkerrecht der Civilisirten Staaten, als Rechtsbuch Dargestellt* (Heidelb. 1868; French trans. under the title *Droit International Codifié*); and D. D. Field, *Draft Outline of an International Code* (Lond. 1872).

Interplead'er Suit is a suit in the Chancery division in England, or in the Court of Chancery in Ireland, to determine which of two or more claimants is entitled to the thing claimed. The corresponding process of Scotch law is called *Multiplepoinding* (q. v.).

Interpola'tion, in mathematics, is the operation of inserting between two terms of a series other terms which shall conform to the series. It also includes the much more general and difficult problem of finding the general *form* of a function, for which certain particular values are given. In physical science it is consequently a method of great importance, since by its means the law regulating a phenomenon can be deduced from particular observed cases of the phenomenon. Its complete theory requires the aid of the highest branches of algebra, and is intimately connected with the calculus of finite differences.

In'terval, in music, is the distance (or 'difference in acuteness and gravity') between two musical sounds. An I. is named according to the number of degrees (on the *stave*) of which it consists, the two extremes being counted. The octave and every I. less than that are called 'simple.' Larger intervals than the octave are called 'compound,' but in harmony the 9th, 11th, and 13th are often treated as independent intervals. Intervals are also classified as 'diatonic' and 'chromatic;' the former are such as occur in an unaltered diatonic scale, while the latter are 'augmentations' and 'diminutions' of the former by one semitone. Thus G to A♯ is an 'augmented 2d.' The diagram contains a specimen of each simple diatonic I., with the names most commonly used.

'Augmented' intervals are chromatically larger than the largest diatonic intervals of the same name; 'diminished' intervals are smaller than the smallest.

Intes'tacy is the legal term for the condition of one who died without a will. The eldest son inherits the real property of an intestate. In England he takes, in addition, his share of the personal estate; but not so in Scotland. (See COLLATION; Eng. law, HOTCHPOT.) Failing the eldest son and his issue, then the real estate descends to the second, third, and all other sons of the intestate, respectively in order of birth, and to their issue in like order. (See HEIR-AT-LAW; HEIR PRESUMPTIVE; BROTHERS, LAW OF SUCCESSION AMONG.) Regarding the division of the personal property of an intestate in England, see DISTRIBUTIONS, STATUTE OF; Scot. law, CONQUEST, SUCCESSION.

Intestine is the name given to that portion of the alimentary canal extending from the stomach to the anus. It is divided primarily into two parts, the *small* and the *large* I. The *small* I., about 20 feet in length in the adult, has been subdivided by anatomists into three portions—first, the *duodenum*, about 10 to 12 inches in length, next the stomach; second, the *jejunum*, consisting of many convolutions, and measuring about 8 feet in length; and, third, the *ileum*, forming the remainder, and terminating in the great I. The small I. is a tube formed of several coats having different functions. Externally it is covered almost entirely by a thin covering formed by the serous membrane which lines the abdominal cavity. This membrane is derived from the web called the *mesentery*, which connects the bowel with the trunk. The mesentery is double up to the inner margin of the bowel. There the two layers separate, so as to form a sheath for the bowel, covering its outer surface. Thus the bowel is connected with the body, and is covered by a smooth membrane which permits its various movements with a minimum of friction. The mesentery also conveys to and from the bowel blood-vessels, lymphatics, and nerves. Beneath the serous membrane there is a muscular coat formed of involuntary or non-striated muscular fibres, and consisting of two layers —an outer longitudinal, and an inner circular layer. These muscular coats by their contractility, under the influence of the nervous system, mechanically propel onwards the semi-digested matter in the bowel. Such movements are usually called *peristaltic*. Within the muscular coat a thin layer of connective tissue is found, in which vessels, nerves, and lymphatics ramify, and within this there is the internal coat or lining membrane of the I. When examined by the naked eye, this presents a shaggy or flocculent appearance like velvet, due to the presence of innumerable small processes projecting from its surface, called *villi*. It also shows a number of transverse folds or wrinkles, which are most marked when the bowel is not distended, called *valvulæ conniventes*. These folds increase the absorptive surface of the bowel. The mucous membrane of the small I. is probably the most important physiologically. By structures found in it at least three distinct functions are performed, namely, (1) absorption by blood-vessels, (2) absorption by special organs in the villi called *lacteals*, and (3) the secretion of various fluids by glands. (1) The mucous membrane is abundantly supplied by vessels which, by a process probably of a physical character similar to endosmotic action by dead membranes, absorb soluble matters directly into the blood. Such matters are water, salts, sugar (formed by the action of saliva on starch), and soluble forms of albumen known as *peptones*, produced by the influence of the gastric juice on albuminates. They pass into the blood, and are carried in the first instance to the liver. (2) The *fats* are absorbed chiefly by the lacteals in the villi. Each villus is a minute finger-shaped projection from the lining membrane of the bowel. In its interior and near its centre there is a delicate vessel, termed a lacteal, which during digestion is found, when examined microscopically, to be filled with fatty matter. The lacteal unites with others from adjacent villi to form a larger vessel, which carries the absorbed matter to glands in the mesentery, where it undergoes changes fitting it for the formation of blood. Covering the villus there are numerous epithelial cells of columnar form, which probably, in the first instance, absorb the fatty matter and transmit it to the lacteal. (3) The secretory structures in the small I. are of two kinds—first, numerous small tubular glands, which absorb throughout its whole course; and, second, of racemose glands, which are found only in the upper part of the duodenum, that is, next the stomach. The first are known as Lieberkühn's glands; while the second are named, also after their discoverer, Brunner's glands. These glands secrete the intestinal juice, a clear, limpid, alkaline or neutral fluid, which has been found to have the property (1) of converting starch into sugar; and (2) of acting slightly on albuminous compounds, changing these into peptones. As the food passes along the small I. it is termed *chyme*. It is mixed with the bile, pancreatic juice, and intestinal juices. Each of these have definite actions on it, the general result of which is to fit certain portions for being absorbed. Absorption takes place, as already mentioned, by two channels—first, by the vessels; and, second, by the lacteals of the villi. As it passes slowly along the bowel the nutritious portions of the food are gradually absorbed, and when it reaches the great I. it is nearly non-nutritious, and it assumes a fœcal odour. (In the small I. two other kinds of glands are found, named the solitary and agminated glands of Peyer; but these belong to the system of blood-glands, and have to do, not with the formation of any secretion for the I., but with the preparation of blood.)

The great I. consists also of three parts—first, the *cæcum*, which is next the ileum, and which is found in that part of the abdominal cavity above the right groin; second, the *colon*, which passes upwards on the right side to nearly the level of the liver, then transversely across the body, and then downwards on the left side, so as to terminate in the third portion or *rectum*, which passes through the pelvis and ends at the anus. The great I. is

short, but much more capacious, considering its length, than the small I. It has the same coats as those already described, but two points require to be specially noticed. First, the longitudinal layer of involuntary muscular fibres, instead of being uniformly disposed around the bowel, as in the small I., is arranged in three distinct bundles, and as these are shorter than the length of the bowel, the latter presents a peculiar sacculated or puckered appearance, as if it had constrictions at certain intervals; second, the mucous membrane has no villi. The alimentary matter in the great I. has lost nearly all its nutritious properties, and is not fit for absorption It now gradually, as it passes along the bowel, acquires more and more of a fœcal character, probably because fermentations and decompositions go on, the result of which is the formation of compounds of fœcal odour, and because a true process of *excretion* also takes place in this portion of the alimentary canal. Here, doubtless, matters are separated from the blood, which, if retained, would prove injurious; and thus the great I. is not only an organ of excretion, so far as the refuse material of food is concerned, but also as regards matters separated directly from the blood, which are mixed with bile and intestinal secretions.

Intestinal Diseases are morbid conditions characterised by functional disorders, lesions of texture, or both combined, of the lesser intestinal canal, the organic lesions being, in many respects, identical with similar lesions affecting the stomach. The functional disorders are different, depending upon irritation or perverted action, and are expressed by a peculiar set of symptoms, such as spasms, colic, flatulence, constipation, various forms of diarrhœa, hæmorrhages, &c. I. D. are numerous and very frequently complicated, being the concomitants or sequelæ of a variety of systemic disorders which attack the intestinal canal as well as other tissues and organs of the body, directly or indirectly. Indeed there are but few disorders which do not implicate the intestinal track mediately or immediately. The several parts under which the intestinal canal is anatomically described are influenced by local inflammatory processes, resulting in lesions of texture, and by a variety of organic changes and consequent disordered functions. *Softening of tissues* may take place in the small intestines, but it is less common than in the stomach. *Glandular lesions* and *degenerations* are of much more frequent occurrence, resulting in atrophy or hypertrophy of the mucous membrane of the intestines, the glandular structure being altered or altogether replaced. These changes are usually associated with other complex morbid processes, as in constitutional diseases or organic lesions leading to impairment of health, and during the progress of some zymotic diseases as *cholera, dysentery*, and *enteric fever*. *Erythematous congestion* of the mucous surface, depending upon a variety of causes, such as changes of temperature, errors in diet, &c., produces intestinal catarrh, variously named *enteria, diarrhœa mucosa, summer* and *autumn diarrhœa*, and is usually associated with a congested state of the liver, the prominent symptoms being frequent fluid alvine discharges, gripping pains and tenesmus; but the belly is not painful when pressed, as in peritonitis, or acute inflammation of the bowels. (See DIARRHŒA.) *Inflammation of the intestines*, or *Enteritis* (q. v.), seldom affects the intestine throughout its whole extent, and the symptoms generally express themselves in the ileum. The intestinal mucous membrane is, like the spleen, liver, and kidney, subject to *waxy*, or *Amyloid Degeneration* (q. v.), the arterial capillaries of the villi and the surrounding mucous and submucous tissues being chiefly affected, and frequently to such an extent that the villi drop off, the mucous membrane being also destroyed; and ulcers are developed which penetrate deeply into the tissue, resulting in fatal hæmorrhage or perforation. *Colic, ileus, volvulus, intus-susception*, and *invagination* are the names for a variety of severe and dangerous I. D. which are described under their appropriate headings. See also RECTUM, DISEASES OF.

Intona'tion, when it does not mean *Intoning* (q. v.), refers to the sounds of the scale. The pitch of each of these sounds bears an arithmetical ratio to that of the keynote. The notes of a keyed instrument do not represent perfectly correct I. See TEMPERAMENT and HARMONICS, and consult Woolhouse's *Essay on Musical Intervals, &c.* (Lond. 1835).

Into'ning, the practice of singing a part of the church-service, including the delivery of the prayers, in a monotone. This is the custom in the Roman Catholic, the English, and the Lutheran Churches, though in the last two it is not universal. Prayers were commonly intoned by the Jews, and this practice is also widely diffused among barbarous tribes.

Intoxica'tion. See INTEMPERANCE.

Intra'dos (Fr., from Lat. *intra*, 'within,' and Fr. *dos*, from Lat. *dorsum*, 'back'), in architecture, the inner or lower line of an arch, or the flat surface of a vault turned towards the interior of a building, in opposition to the *Extrados*, or outer curve of the voussoirs or wedge-shaped stones forming an arch or vault.

Intrench'ment. See FORTIFICATION.

In'troit, music sung in the Roman Catholic service while the priest goes to the altar to celebrate the mass, and that sung in the corresponding part of the Anglican service.

Intromiss'ion, in Scotch law, is the assuming of the possession and management of property belonging to another. When this is done according to law, it is called *legal I.* When done contrary to law, it is called *vicious* I. The latter term is especially applied to an heir's unwarrantable dealing with the movable estate of his ancestor.

Intui'tion ('a looking upon,' from Lat. *in*, and *tueor*, 'I look') is a term used in philosophy to denote a power which a certain school supposes the mind to possess of instantaneously perceiving the truth of things without a process of reasoning. That the mind really possesses any such power is more than questionable. On the other hand, it may be admitted that mental operations sometimes transact themselves with a swiftness so incalculable, that their process fails to obtain the notice of consciousness. See MIND.

Intus-Suscep'tion is the accidental insertion of one portion of intestine into another, and is a most serious disorder, generally terminating fatally. I.-S. occurs more frequently in infancy and childhood than at any other period of life. The colic is extremely severe, and there are remissions and exacerbations of pain, increasing in violence with each repetition.

In'ula, a genus of the *Compositæ* family, numbering some fifty species, of which six are natives of Britain, notably the ploughman's spikenard, the golden samphire, and the flea-bane; whilst Elecampane (q. v.) is perhaps only naturalised with us from former cottage-garden cultivation.

In'ulin, a starchy material obtainable from various plants; differing from ordinary starch in being coloured yellowish-brown by iodine. See ELECAMPANE.

In'uus, a genus of *Catarhina* (q. v.) or Old World monkeys, of which that inhabiting the Rock of Gibraltar is an example. This species, representing the only wild European monkey, was bred from ancestors imported from the opposite coast of Africa.

In'valides, Hôtel des, the Chelsea Hospital of Paris, stands near the S.E. angle of the Champ de Mars, and occupies 28 acres. It was built (1671–75) by Louis XIV. from designs by Bruant, with accommodation for 5000 disabled veterans; but in 1872 contained less than half that number of privates, and 160 officers. Each of its inmates receives, besides board and lodging, a small monthly pension—from 30 francs for a colonel to 2 francs for a private. The Hôtel is a four-storied structure with a façade of 612 feet, is divided into five large and fifteen smaller courts, has a library of 30,000 volumes, and in its western wing contains the Artillery Museum. The chapel is rendered by its gilded dome (328 feet), designed by Mansard, one of the most conspicuous objects of Paris. Here are buried Vauban, Turenne, Duroc, and Bertrand, and hither the body of Napoleon I. was brought from St Helena, September 15, 1840.

Inven'tors and Pa'tentees. See PATENTEES AND INVENTORS.

In'ventory, in English law, is a list and description of goods and chattels. It is especially applied to the list of a deceased person's effects made up by his executor or administrator. In Scotland it has a wider application. See BENEFICIUM INVENTARII.

In Ventre Sa Mere, a term in English law denoting an unborn child. It is especially applied to the Fœtus (q. v.) whose

father dies before its birth. A child so born has the same legal rights as if born during the lifetime of its father.

Inver'ary, the capital of Argyleshire, and long the chief town of the Western Highlands of Scotland, lies on a small bay on the W. side and near the head of Loch Fyne, at the mouth of the small river Aray, 60 miles N.W. by W. of Glasgow. It mainly consists of one street, running E. and W., near the centre of which stands an old square church, and an obelisk to the memory of seventeen Campbells who were executed without trial by Montrose in 1685. A stone bridge here crosses the Aray, and there is a ferry to St. Catherine's on the E. shore of Loch Fyne. Regular steamboat communication is maintained with Glasgow. The only industry is the herring fishery. Pop. (1871) 905. I. was made a burgh of barony in 1472, and a royal burgh in 1648. The old town lay a little to the N., and was deserted for the present one about 1742. With Oban, Irvine, Ayr, and Campbeltown, I. sends one member to Parliament. In the vicinity is I. Castle, the residence of the Duke of Argyle.

Invercar'gill, a town in the south or middle island of New Zealand, situated on a small estuary known as the New River, in 46° 27′ S. lat. and 168° 25′ E. long. Only small vessels can reach I., the larger ones loading and discharging at Bluff Harbour, 18 miles distant, with which I. is connected by rail. Pop. (1875) 6000.

Inverness', the chief town of the county of the same name, Scotland, on both banks of the Ness, about a mile from its mouth, 156 miles N.N.W. of Edinburgh by rail. It is picturesquely situated at the N. end of the great glen of Scotland, and is popularly regarded as the capital of the Highlands. The principal buildings are the castle, built on the site of an old royal fortress in 1835; the cathedral of St. Andrews, in Decorated Gothic style, erected at a cost of £20,000 in 1866; a townhall and exchange of date 1708. The I. Academy was founded by royal charter in 1792, and endowed by Captain W. Mackintosh with £20,000. The *Clach-na-cudden* ('stone of the tubs,' from having served as a resting-place for those carrying water from the river), a blue lozenge-shaped stone, long regarded as the palladium of the town, is preserved in the High Street, near the town-cross. There is a trade by the Moray Firth and the Caledonian Canal in grain, potatoes, spirits, &c., and manufactures of woollen cloth, leather, spirits, iron and brass wares, sailcloth, &c. In 1875 there entered the port 1862 vessels of 210,313 tons, and cleared 1524 of 175,941. The river is crossed by a wooden bridge, a modern suspension bridge, a foot-bridge, and a railway bridge. I. has three newspapers, and with Forres, Fortrose, and Nairn, sends one member to Parliament. Pop. (1871) 14,510. I. received a borough charter from William the Lion in the 12th c. In 1411 it was sacked by Donald, Lord of the Isles. As 'a solitary outpost of civilisation' (Macaulay), it suffered greatly from the wild descents of the Highlanders. The town strongly supported the Stuart cause, and after the '45 some thirty-six men were executed here. The old castle, of which there are no remains, was seized by the adherents of Edward I. in 1303, and recovered by Robert Bruce. James I. is said to have held a parliament here in 1427. It was taken by Cromwell in 1649, and destroyed by Prince Charles Edward in 1746.

Inverness'-shire, the largest county of Scotland, is bounded E. by Nairn, Elgin, Banff, and Aberdeen, W. by Ross-shire and the Atlantic, S. by Argyle and Perth, and N. by Ross-shire. It includes the western islands of Skye, N. and S. Uist, Barra, and Harris, the southern portion of Lewis. Area 4256 sq. miles; pop. (1871) 87,480. The insular portion alone has an area of 1150 sq. miles. The mainland is extremely mountainous. Glenmore (q. v.), or the Great Glen of Scotland, traverses it in the direction of its greatest length, and along the bottom of the glen stretch Lochs Lochy (10 miles long), Oich (4), and Ness (27) linked together and with the sea at both ends by the Caledonian Canal (q. v.). The Grampians form the S. boundary of I., rising in Ben Nevis, the highest peak in Great Britain, to a height of 4406 feet; other heights are Ben Aulder (3757 feet), Cairn Gorm (4090), and to the N. of Glenmore, Mam Suil (3862), Ben Scrian (3188), Ben Douran (3517), Mealfourvounie (2730), Scuir-na-Lapich (3740). Between the Grampians and the lateral range of the Monadhleadh mountains, a broad strath is watered by the Spey; other rivers flowing N.E. are the Findhorn, Nairn, and Beauly; the Foyers flows into Loch Ness, the Garry into Loch Oich, and the Spean into Loch Eil, a western arm of the sea. The 'Fall of Foyers' is one of the glories of the country. A large part of the surface is covered with heath (especially in the southern district of Badenoch), and with forests of fir and pine, but the glens and straths are fertile and well cultivated. The W. coast is indented by Lochs Hourn, Nevis, Nanuagh, Moidart, &c. In 1876 there were 40,221 acres under corn crops, 19,553 under green crops, 26,895 under clover, sanfoin, and grasses in rotation, and 35,228 in permanent pasture, exclusive of mountain or heath; the number of horses was 9008, of cattle 53,242, of sheep 724,518, and of pigs 4127. The chief crops are barley, oats, rye, wheat, potatoes, and turnips. In a varied geological formation, the prevailing rocks are gneiss, mica, slate, granite, and porphyry. Game is abundant, including the roe and red deer, Alpine hare, otter, hawk, and eagle. Gaelic is the prevailing language. The only burgh is Inverness; other places are Beauly, Fort William, Fort Augustus, and Fort George. The county is traversed by splendid military roads, constructed in the 18th c. The Highland Railway enters I. to the E. of Loch Errocht, and continues N.E. through Strathspey.

Inver'sion (1) of *intervals* (in music) takes place when the lower note is replaced by that an octave higher, or *vice versâ*. Thus—

(2) I. of *chords*. (See HARMONY.) (3) I. of *parts*. (See DOUBLE COUNTERPOINT.) (4) I. of *phrases*, also called inverse movement; where a subject and its answer (see IMITATION) move in opposite directions but with the same intervals, *e.g.*, the opening of 'Egypt was Glad,' in *Israel in Egypt*, by Handel.

Invertebra'ta, a name applied collectively to include the groups of animals of lower rank than the *Vertebrata* (q. v.). The characters of I. are those which may be regarded as negative when applied to vertebrates. Thus I. have no spine or *Notochord* (q. v.). They have generally numerous limbs; jaws in the form of modified limbs, or consisting of hard parts developed in the lining membrane of the mouth; no *absorbent vessels*, and no *portal system* of veins; and their nervous system is not shut off or specialised from the general body-cavity. The invertebrate groups are the *Protozoa*, *Cælenterata*, *Echinozoa*, *Annulosa*, and *Mollusca*, all of which are described in special articles.

Inves'titure (late Lat. *investitura*, from Lat. *in* and *vestire*, 'to put in possession') is 'the putting ecclesiastics in possession of their temporalities by a formal act of the civil power.' Previous to the 9th c. there were no forms for this peculiar to the clergy, further than the ordinary symbolical form according to which the sovereign delivered to his vassals a written instrument, green twig, &c., to signify the transfer of the dominion over the property which they held from him, the common name for which form was 'traditio.' The mode of investing bishops and abbots with the ring and crozier, which were the insignia of their office, the one being the symbol of the sacred mysteries, and the other the pastoral staff, was introduced at the time when sovereigns assumed to themselves the power of conferring sacerdotal offices. In order to secure the power of conferring the sacred offices on whom they pleased, as soon as any of the higher officers in the Church died, they required the staff and ring to be transferred to them. These were delivered to the man of the sovereign's choice, who thereafter repaired to the metropolitan, and, delivering them to him, was reinvested with them after they were consecrated. This custom led to scandalous practices in the sale of benefices, and Pope Gregory VII., in his attempt to put down simony and his battle for the aggrandisement of the Church, decreed in a council held at Rome 1075, that 'if any person in future accepts a bishopric or an abbacy from the hands of a layman, such person shall not be regarded as a bishop or an abbot, nor shall he enter a church, till he has given up the place thus illegally obtained. . . . And every individual, be he emperor or king, who bestows investiture in connection with such an office, shall be excluded from Church communion.' The conflict waged by Gregory and succeeding

Popes on this matter ended (at the Diet of Worms, 1122) in the clergy getting the right of election of bishops and abbots, while the sovereigns retained the right of I., not with the ring and staff, but with the touch of the sceptre.

Investiture, a term of Scotch law denoting the act of giving feudal possession of heritable property. This is now done by registration of the deed of conveyance.

Invocation of Angels and Saints is practised in the Romish and Eastern Churches, the following distinction being made, however, in the different kinds or degrees of worship:—*Douleia*, the worship due to angels and saints; *hyperdouleia*, due to the Virgin Mary; and *latreia*, due to God alone. In the first three centuries of the Church all worship of angels and saints was considered idolatrous. In the beginning of the 4th c., during the Arian controversy, an argument for the proper divinity of Christ was drawn from the worship offered to him, on the obvious ground that worship could not be offered to any creature, but to God alone. Indeed, the ground on which worship could be offered to saints was cut away by the opinion of the fathers that they did not enter into the enjoyment of the beatific vision till after the day of judgment. At first, too, it may be, the worship in the chapels built at the tombs of martyrs was offered to God, and the offerings laid on the altars made to him, the chapels and altars being simply memorials of the martyrs. But the pagan practice of building temples and making votive offerings to gods and demigods is well known, and it would have been wonderful if ignorant people, full of pagan notions, had not entertained similar sentiments towards the angels and saints of Christianity, and sought to express them in a similar way. Thus Hlothar, King of France, built a church to St. Vincent, who had helped him against the Goths. The modern Roman Catholic doctrine on the subject (*Council of Trent*) is, that 'the saints, who reign with Christ, and guardian angels, offer prayers to God for men; that it is good and useful to invoke them, and, on account of the benefits to be obtained from God through Jesus Christ, to flee to them for help.' The objections which Protestants generally urge against the practice are:—(1) That it is at least superstitious, being founded on the assumption—of which, it is asserted, there is no Scripture proof—that the spirits of the dead are accessible to the living, and capable of hearing and answering their prayers. (2) That in actual practice it involves all the elements of idolatry, even although it were granted that the doctrine as expounded by theologians does not. That blessings are actually sought by the people at the hands of creatures which God alone can bestow. And not only so, but that this implies the possession by creatures of attributes which belong to God alone, since it is assumed that the saints are omnipresent, or at least that they can hear prayers addressed to them from all parts of the earth at the same time. See Hodge's *Syst. Theology* (Edinb. 1873); Gieseler's *Lehrbuch der Kirchengeschichte* (Bonn, 1855, Eng. trans. by Davidson).

In'voice (from the Italian *avviso*), literally a letter of 'advice' or information respecting the despatch of goods, giving particulars of their quantity and price.

Involu'cre, the whorled bracts at the base of an umbel or head of flowers, or sometimes below a single flower. An *involucel* is the I. of a *partial umbel*. See INFLORESCENCE.

In'volute. See EVOLUTE.

Involu'tion. See EVOLUTION AND INVOLUTION.

I'odine. This element was discovered in 1811 by Bernard Courtois, a saltpetre manufacturer of Paris. He noticed that the iron vessels he used for crystallising the salts were corroded by keeping the mother liquors in them. On distilling these liquors with sulphuric acid, he got a substance which, when heated, was converted into a splendid purple vapour. This body was subsequently investigated by Gay-Lussac and Sir Humphry Davy, who pointed out its resemblance to chlorine. The name I. (*ion*, 'violet') was given to it from the colour of its vapour. I. is a very widely-distributed, but nowhere abundant element. It occurs in minute quantity in many mineral waters; combined with mercury, silver, and lead; combined with sodium, potassium, and magnesium; in salt mines and brine springs; in several land plants; in plants growing on the sea-shore, and in sea-water itself, but only in minute quantity. Sea-plants, however, such as *Fucus digitatus*, *F. saccharinus*, *Neva umbilicalis*, and many others, as well as sponges, and other sea-animals, assimilate I. from the sea-water, and retain it in small but such appreciable quantity that it is from these sources that I. is usually manufactured. The sea-weed, either drifted on shore from deep water or cut from the rocks at ebb-tide, is dried and incinerated at as low a temperature as possible. The semi-fused ash is black or grey, somewhat deliquescent, and is known technically as *kelp*. The kelp is dissolved in hot water, the liquor concentrated, and a quantity of salts removed by crystallisation. The liquor or I. ley is next mixed with sulphuric acid, which sets free several gases, and produces a fresh crop of crystals. The liquor is then run into an earthenware or leaden still connected with a series of receivers. It is heated gently in the still, and binoxide of manganese having been added, the I. is liberated, rises in vapour, and passes over into the receivers, in which it condenses. If necessary, it can be purified by sublimation. There is a different method of dealing with the sea-weed from that just described. Instead of being converted with kelp, the sea-weed is thoroughly dried, compressed, and heated in iron retorts at a regulated temperature. Gas is given off, tar and ammonia distil over, and a fixed residue remains in the retorts, consisting of charcoal and all the fixed salts, including iodides and bromides. The residue is lixiviated with water, the salts separated by crystallisation, and the mother liquors treated with sulphuric acid and binoxide of manganese to separate the I., as in the previous process. I. crystallises in rhombic octahedra, which by spontaneous sublimation are obtained of great beauty and with a brilliant lustre, but in general it is got in plates or crystalline masses, with an inferior lustre, like blacklead. Pure I. is black. Its specific gravity is 4·948: it is soft, and easily powdered. It is somewhat volatile at the ordinary temperature; when heated, it fuses about 113° C., and boils at 175° C., giving off a purple vapour. It does not conduct electricity. I. has a peculiar odour; its vapour attacks the eyes, nostrils, and windpipe: it has a harsh taste, and is very poisonous. It stains the skin yellow or brown, but the stain can be readily removed by an alkali; if kept in contact with the skin, it gradually corrodes it. I. is sparingly soluble in water; it dissolves more easily in alcohol and ether, especially if iodide of potassium be present. The solutions are brown. In bisulphide of carbon it dissolves with a rich purple colour. I. combines with all the metals, and with most of the non-metallic elements. It readily combines with and dissolves iron and zinc when digested with these metals in water; it forms compounds with antimony, arsenic, bismuth, cadmium, copper, iron, lead, mercury, potassium, silver, and zinc, most of which are of importance in the arts, in medicine, and in practical chemistry. With oxygen it forms iodic anhydride (I_2O_5), and there are also known iodic acid (HIO_3), and periodic acid (HIO_4). Hydriodic acid (HI) is best obtained by cautiously heating I., red phosphorus, and water together. It is a colourless, fuming gas, very soluble in water, with a strongly acid reaction, and decomposes on keeping, with liberation of I. When I. is digested with cold, strong ammonia, a black powder is obtained containing iodide of nitrogen. When dried, the powder explodes violently with the slightest touch, and sometimes spontaneously. I. in solution is recognised by the beautiful blue colour it gives to starch, paste, or starch solution. If the I. is free the blue colour is at once obtained; but if the I. is in combination, it must be liberated by the cautious addition of chlorine, bleaching-powder, or similar re-agent. The combining weight of I. is 127.

Io'doform (CHI_3) is a substance which is analogous in composition to chloroform, but differs from it in properties: it has been used in medicine in cases of neuralgia and sciatica, and in certain virulent diseases. It is prepared by acting on alcohol, and many other bodies, with iodine and potash. It is obtained in yellow crystalline scales, and has a peculiar smell. It is insoluble in water, but dissolves in chloroform and in ether, and sparingly in alcohol.

Io'na, a celebrated island, about 3½ miles long by 1 to 1½ broad, at the S.W. end of Mull, Argyleshire, from which it is separated by a narrow channel. Pop. about 300. Of old it was known as *I* (pronounced *ee*) = 'the island.' Adamnan, in his *Life of St. Columba*, following the fashion of the time in making the name into a Latin adjective, writes *Ioua insula*. Some transcriber mistaking the *u* for *n* wrote *Iona*, and thus it has continued. In Gaelic it is known as *I. Chalum Cille* = 'the island

of Calum of the Church.' In 563 St. Columba (q. v.) and twelve companions founded the monastery of I., remarkable for this feature in its constitution, viz., that the abbot exercised jurisdiction over the bishop in his neighbourhood. Owing to the high character for learning and piety maintained by the successors of Columba in I., the churches which the saint founded, all regarded the mother church with greatest reverence, and for 200 years it continued to grow in fame and power. In the beginning of the 9th c. the island was ravaged by the Danes. The 'relics' of Columba were transferred to Kells, in Ireland, whence some of them were sent to Dunkeld, in Scotland. The cathedral of Durham also claimed the possession of some. During the next 300 years the sea-rovers frequently repeated their visits, plundering and slaying. In the 11th c. Magnus Barefoot, King of Norway, having conquered the Hebrides, placed I. under the jurisdiction of the Archbishop of Trondjheim; but when Somerled, Lord of the Isles, married the daughter of Magnus' successor, the Southern Hebrides were given up to him, and I. was restored to its original place. Its monastic authority, however, decreased as Diocesan Episcopacy spread throughout Scotland after the reign of Malcolm Canmore; and when its church was made the cathedral of the Bishopric of the Isles its peculiar character necessarily disappeared.

The antiquities of the place are interesting more for the profound associations connected with them than for the appearance which they present. The walls of the small cathedral and its square tower, belonging to the beginning of the 13th c., are still standing. The remains of St. Oran's Chapel (ascribed to Queen Margaret in the 12th c.) and of the 'Nunnery' are also to be seen, and several other chapels are spoken of as having at one time existed. The Cross of St. Martin, 14 feet high, is the finest specimen extant of the Celtic cross. Maclean's Cross, 10 feet high, is also beautiful. There are other smaller ones; but the story of Sacheverell, unsupported by any evidence, of the 360 crosses cast into the sea by order of the Presbyterian Synod of Argyle, is treated by Dr. Reeves, and all who have examined the subject, as an absolute fable. Of the cemeteries, the oldest is 'the Druids';' after it comes *Rèlig Orain*, 'St. Oran's Burial Ground,' and *Iomaire nan Righrean* = 'the ridge of the kings,' said to contain the dust of several kings of Scotland, Ireland, France, Denmark, and the North of England. See Montalembert's *Monks of the West*, which gives a glowing but misleading account of I.; the Duke of Argyle's *Iona* (Lond. 1871): for pictorial representations of the existing monuments, Graham's *Sketches*; and for accurate knowledge of 'the monastery of I.,' Dr. Reeves' admirable work.

Io'nia, a country on the western coast of Asia Minor, which extended for 90 miles along the Ægean Sea from Phocæa in the N. to Miletus in the S., but penetrated only a few miles inland. Its inhabitants, the Ionians, derived their name from the eponymous hero Ion, and according to the myth immigrated from Greece in 1044 B.C.; but recent writers have questioned whether they did not rather arrive at the shores of the Ægean immediately from the East, and trace a connection between the names Ion and Javan (a son of Japheth), the Ionians and the Yavanas of Sanskrit literature. I. originally contained twelve states (increased to thirteen by the addition of Smyrna in the 7th c. B.C.), which, independent of each other, yet formed a confederacy—the Ionian League—for common purposes, and held regular meetings at Panonium, on the northern slope of Mount Mycale. (See CLAZOMENÆ, COLOPHON, EPHESUS, MILETUS, SAMOS, SCIO, and SMYRNA.) The Ionians were a maritime race, and early cultivators of the arts and sciences, giving rise to a philosophy, and to styles of architecture and painting, whilst their soft and vocal dialect, the Ionic, was that of Homer, Hesiod, and the epic poets generally. They passed successively under the sway of the Lydians (about 700 B.C) and the Persians (557), revolted unsuccessfully against the latter in 500, and again with better result in 479, became for a short time dependent upon Athens, but in 387 were again made over to Persia. On the overthrow of the Persian monarchy by Alexander, the Ionian cities were annexed to Macedonia, along with which they fell under the Romans, still retaining great commercial and artistic importance, which only perished with the irruption of the Turks in the middle ages.

Io'nian Islands, a chain of some forty islands, extending along the W. and S. coast of Greece, and having a total area of 1041 sq. miles, and a pop. (1870) of 18,879. The names of the seven largest are Corfu, Cephalonia, Santa Maura, Ithaki, Zante, Cerigo, and Paxo. They are for the most part mountainous, and have little wood and water, but enjoy a delicious climate. Among the abundant mineral products are marble, coal, pitch, sulphur, and salt, while the fertile valleys and coast plains yield grapes, olives, roses, cotton, flax, &c. In the earliest ages of Greece, the islands were under hereditary princes of their own, who subsequently made way for republican constitutions. They suffered in all the vicissitudes of Hellas, and on the division of the Roman power fell to the Byzantine Empire, but were seized by the Duke of Calabria (afterwards King of Naples) in 1081. In the beginning of the 15th c. they passed to the Venetians, who retained them till the overthrow of the republic by Napoleon in 1797, when they were ceded to France. They were taken possession of by Russia and Turkey in 1800, by France in 1807, and by England in 1809. In 1815 they were formed into the Septinsular Republic under the English protectorate. The government was at first stringent, but in 1848 the franchise was lowered, ballot was introduced, and freedom allowed to the press. Immediately followed a demand for annexation to Greece. Sir Henry Ward suppressed an insurrection in 1849, but Mr. Gladstone's intercessions as special commissioner in 1858 was fruitless. The islands were transferred to Greece by treaty concluded in London 28th May 1867. They had cost England £100,000 yearly. See Davy, *The I. I. under British Protection* (Lond. 1851); Ansted, *The I. I.* (Lond. 1863); Kirkwall, *Four Years in the I. I.* (2 vols. Lond. 1864).

Ionian Mode. See GREGORIAN CHANT.

Ionian School, a collective title for several of the earliest Greek philosophers, from Thales to Anaxagoras, whose speculations were of physical and pantheistic character, and who for the most part were natives of Ionia in Asia Minor. See HELLENIC PHILOSOPHY; and Ritter, *Geschichte der Ionischen Philosophie* (Berl. 1821).

Ion'ic Order. See COLUMN and GRECIAN ARCHITECTURE.

I'owa, one of the United States, lies between the Mississippi on the E. and the Missouri on the S. and W., and is bounded on the N. by Minnesota. Area, 55,045 sq. miles; pop. (1870) 1,182,933. The country is extremely flat, consisting for the most part of 'rolling' prairie considerably above the level of the sea, and is worn into deep rocky gullies by the numerous tributaries of the two great boundary rivers. There are many small lakes, chief of which are Spirit Lake (area, 14 sq. miles), Okoboji (15 miles long), and Clear Lake (4 miles), and extensive forests of oak, elm, cotton-wood, black walnut, hickory, linden, maple, &c. The climate is mild and equable, and the principal crops are corn, wheat, oats, barley, buckwheat, and rye. The surface is covered with diluvial deposits, and these again with alluvium in the river bottoms. The upper coal-measures occupy the whole S.W. portion of the State, while the N.E. is traversed by a tract of Lower Silurian. The I. coal-field has an area of some 7000 sq. miles. Besides coal, which is extensively mined, the minerals found include lead (argentiferous galenga ore), iron, gypsum, and limestone. Chief among the exports of I. are flour, timber, cut meats, and tobacco. Des Moines is the capital, but the only town of more than 25,000 of a pop. are Davenport and Dubuque. In 1874 there were 3800 miles of railroad, and over 300 newspapers in the State. As part of the Louisiana purchase, the county of I. came to the United States in 1803. I. territory was organised in 1839, and admitted to the Union as a State in 1846. In 1870 the number of Indians in I. had dwindled to 48.

Iowa City, the capital of Johnson county, in Iowa, U.S., at the head of navigation on the I. river, 115 miles W. of Rock Island by rail. It was the State capital till 1857, when it gave place to Des Moines, and is still the seat of the State college. It has fifteen churches, extensive manufactures of woollens, flax, oil, &c., and a large local trade. Pop. (1870) 5914.—**I. College** was founded in 1847 by an association of Congregationalists and Presbyterians, but is free from all church influence. The endowment is under 100,000 dollars, and the number of students is about 250; ladies were admitted in 1867. A fine new building, supplied with chemical laboratories, was erected in 1872.

Ipecacuanh'a is the dried rhizome of *Cephœlis ipecacuanha*, a Brazilian plant belonging to the Peruvian bark family. It is

largely employed in medicine as an emetic and as an expectorant, and was formerly highly esteemed in dysentery. The active principle is emetin, an alkaloid contained in the rind of the 'root.' These roots are about the thickness of a goose quill, of various shades of brown, are contorted, knotted, and annulated; consequently are very characteristic, so that spurious I. may readily be detected. The discovery that the plant can be propagated from the leaf as well as by divisions of the rhizome, has facilitated its present extensive cultivation in India, from whence it is hoped we shall in the future draw our chief supply.

The Medicinal Properties of I.—I. in large doses acts as an emetic, and in small doses as an expectorant and diaphoretic. When it is absorbed it acts upon the mucous surfaces of the respiratory organs and the alimentary canal, and is useful in certain bronchial affections, and also in the acute stage of dysentery. The dose of I. as an expectorant, &c., is from ½ to 2 grains, and as an emetic from 15 to 30 grains. In acute dysentery I. is given in emetic doses, and the first generally causes emesis; but a certain tolerance is established, and large doses can afterwards be given without causing nausea and vomiting. The preparations are *pilula I. cum scilla*, *pulvis I. comp.* (Dover's powder), *lozenges* of I., and in combination with *morphia; vinum I.* and *syrupus* I. Dose—of the *powder*, 5 to 10 grains; of the *wine*, 5 to 40 minims; and of the *syrup*, 15 to 60 minims.

Iphigeni'a, according to Greek legend, was the daughter of Agamemnon and Clytæmnestra, and was brought in her youth to Chalcis, that her sacrifice might propitiate Artemis, who would not, the seer Calchas declared, otherwise allow the Greek fleet to sail to Troy, Agamemnon having slain a stag sacred to the goddess, or having, according to another story, vowed to sacrifice to her the most beautiful production of the year in which I. was born. When I. was about to be sacrificed Artemis bore her away in a cloud to Tauris, where she became priestess of the goddess, and where she afterwards recognised and saved her fugitive brother Orestes (q. v.), with whom, and her sister Electra, she returned to Mycenæ. According to one tradition she died there, though others assert that Artemis changed her into Hecate, a third story being that she received immortal youth and became the wife of Achilles in the island of Leuce. Her story is the subject of Euripides' tragedies, *I. at Aulis* and *I. at Tauris*. The incident of her intended sacrifice is beautifully told by Ovid. Lucretius also refers to it in a fine passage, and Landor has an exquisite poem on I.

Ipomæ'a, a large genus of the *Convolvulus* family; in many cases being plants with long twining stems, arising from a largely-developed rootstock which contains an acrid juice of purgative properties. (See JALAP.) The handsome flowers have brought several species into cultivation as ornamental plants.

Ipomæa purpurea.

Ipsambul'. See ABOUSAMBUL.

Ip'swich, the chief town of Suffolk, England, on a gentle acclivity rising from the N. bank of the Orwell (which above I. is called the Gipping), 12 miles from the sea, and 68 miles N.E. of London by the Great Eastern Railway. It has a few quaint old houses ornamented with plaster mouldings, and is enlivened by many fine villas. Its principal buildings are the church of St. Mary-le-Tower, in richly decorated Second Pointed style; the Roman Catholic church of St. Pancras, with a lofty flèche; a handsome townhall, the façade of which has an open arcade supporting four large statues. Its grammar-school, founded by Cardinal Wolsey, and endowed by Elizabeth, has seven scholarships, including one established as a memorial of the Prince Consort, who laid the foundation-stone of the present buildings in 1847. There are beautiful horticultural gardens, and among the manufactures are agricultural implements, artificial manure, leather and tackle. The harbour admits vessels of 500 tons, and there is an active trade in iron wares, coal, timber, and agricultural produce. Steamers ply regularly between I. and Harwich and London. In 1875 there entered the port 2543 vessels of 179,895 tons; and cleared, 2007, of 140,218 tons. I. was incorporated in the reign of John, and sends two members to Parliament. Pop. (1871) 42,947.

Ipswich, the third largest town in Queensland, is situated on the river Bremner, 25 miles W. of Brisbane (q. v.), with which it is connected both by railway and steamer. Cotton and maize are extensively grown in the neighbourhood, and the cultivation of the sugar-cane has also been commenced. Coal is plentiful and easily worked. The town is pleasantly situated and well built. Pop. (1875) 6000.

Irak'-Aj'ami, a central province of Persia, bounded N. by the Kizl-Ozan River and Elburz Mountains, E. by Khorasan and the Great Salt Desert, S. by Khuzistan and Fars, and W. by Turkish territory. It is 520 miles long and 450 broad, and is almost entirely mountainous, the treeless ranges extending from E. to W., and opening here and there in valleys seldom exceeding 15 miles in width. The mountains send down various rivers—the Karun, Kerkah, Diala, &c. Agriculture is only carried on near the villages, where cotton, rice, various grains, opium, fruits, manna, &c., are produced. The chief towns are Teheran, Ispahan, Natanz, Kashan, and Hamadan. The climate varies from the excessive heat along the verge of the deserts to the wintry severity of the uplands. Among the manufactures are silks, velvets, chintzes, gold and silver brocades, carpets, arms, cutlery, and sweetmeats. The I. militia is organised in eleven regiments of 1000 men each, and are under the command of the proprietors of estates.

Irak'-Ar'abi, a province of Turkey in Asia, lying between the Tigris and Euphrates, and including a strip of land between the Euphrates and the desert. It corresponds to the ancient Babylonia, and contains the ruins of Babylon, Seleucia, and Ctesiphon. See TURKEY IN ASIA, and BABYLONIA.

Iran', the native name of Persia, part of which was known to the Greeks and Romans as *Ariana*. In the Zendavesta the term is *Airya*. See ARYAN.

Irbit', a town of Eastern Russia, in the government of Perm, at the confluence of the I. and Nitsa, and 106 miles E.N.E. of Ekaterinburg. A yearly fair (founded in 1630) is held here in February, which is second only to that of Nijni-Novgorod (q. v.), and attracts upwards of 60,000 traders from all parts of Russia, from Greece, Armenia, Siberia, Persia, and even China. The chief articles of trade are home-manufactured goods, tea, furs, sugar, and wine; of secondary importance are foreign manufactured goods, leather, hardwares, and jewellery. In 1872 the estimated value of the goods offered for sale was £7,500,000; of sales effected, £7,000,000. Pop. 4212.

Ire'land is 'the land of *Eire*,' a word of uncertain derivation. Some think it connected with the Celtic *iar*, 'the West;' others suppose it to be the name of an ancient Irish queen; while others again see in it the root 'ar' ('to till'), which plays so important a part in Aryan philology. The island was known to the Greeks by the name *Ierne* (Erin), 'the island of Eire,' and to the Romans by the name *Hibernia*. It is the second largest of the British Isles, is washed on the N., S., and W. sides by the Atlantic Ocean, and is separated from Great Britain by the N. Channel, the Irish Sea, and St. George's Channel in lat. 51° 2′ 6″—55° 23′ N. and long. 5° 26′—10° 28′ W. It has a length from N.E. to S.W. of 306 miles, a breadth from E. to W. of 180 miles, and a coast-line of 2200 miles, or one mile of coast to every 15 sq. miles of surface. The coast along the E. is for the most part flat and little indented, but on the other sides is bold and rocky, running out in lofty headlands, and opening in many deep inlets to the Atlantic surge. In the E. the chief bays are Belfast Lough, Strangford Lough, Dundrum Bay, Carlingford Lough, Dundalk Bay, Dublin Bay, and Wexford Harbour; in the W., Donegal Bay, Sligo Bay, Clew Bay, Galway Bay, the estuaries of the rivers Shannon and Kenmare, Tralee Bay, Dingle Bay, Bantry Bay, and Dunmanus Bay; in the N., Lough Foyle, Mulroy

Bay, and Lough Swilly; in the S., Cork, Waterford, and Youghal harbours, and Dungarvan Bay. Among the promontories are Malin Head, Bangore Head, and Fair Head in the N.; Carnsore Point, Knockadoon Head, Old Kinsale Head, and Mizen Head in the S.; Bloody Foreland, Teelin Head, Benwee Head, Achill Head, Aghros Point, Slyne Head, Loop Head, Dunmore Head, Kerry Head, Boulus Head, Crow Head, and Sheep's Head in the W.; and Ballyquintin Point, St. John's Point, Ballagan Point, Dunany Point, Howth Head, Wicklow Head, Cahore Point, and Greenmore Point in the E. The most southernly point is at Cape Clear, the extremity of Clear Island, to the S.W. of county Cork. The islands are for the most part very small, and lie close to the mainland; they plentifully fringe the W. coast, where the principal ones, proceeding from N. to S., are the Tory, Arranmore, Mullet, Achill, Clare, Innis Turk, Innis Bofin, Gorumna, Inishmore, Inishmaan, Inisheer, the Blaskets, the Valentia, Skelligs, Bear and Clear islands. Other islands are Rathlin, N. of Antrim; Copeland, N.E. of Donaghadee; the Skerries, Lambay, and Ireland's Eye, E. of Dublin; Saltees, S. of Wexford, and Cove in Cork Harbour. Of the 5000 islands and rocks belonging to I. only 245 were inhabited in 1871. Valentia Island off Kerry is the terminus of the Atlantic cables. I. is divided into the four provinces of Ulster, Leinster, Munster, and Connaught, and these are again subdivided into thirty-two counties, the areas and population of which are as follows, according to the census of 1871 :—

Counties.	Area in stat. acres.	Pop. 1871.	Chief towns.
LEINSTER—			
Carlow	221,342	51,650	Carlow.
Dublin	226,894	405,262	Dublin.
Kildare	418,496	83,614	Athy.
Kilkenny	509,732	109,479	Kilkenny.
King's County	493,984	75,900	Tullamore.
Longford	269,409	64,501	Longford.
Louth	201,601	70,511	Dundalk.
Meath	579,861	95,558	Trim.
Drogheda	453	13,510	Drogheda.
Queen's County	424,853	79,771	Maryborough.
Westmeath	453,468	78,432	Mullingar.
Wexford	576,588	132,666	Wexford.
Wicklow	500,178	78,699	Wicklow.
MUNSTER—			
Clare	827,993	147,864	Ennis.
Cork	1,849,684	517,076	Cork.
Kerry	1,185,917	196,586	Tralee.
Limerick	680,842	191,936	Limerick.
Tipperary	1,061,730	216,713	Clonmel.
Waterford	461,551	123,310	Waterford.
ULSTER—			
Antrim	762,080	404,015	Belfast.
Armagh	328,086	179,260	Armagh.
Cavan	477,394	140,735	Cavan.
Donegal	1,197,154	218,334	Lifford.
Down	612,409	293,449	Downpatrick.
Fermanagh	457,369	92,794	Enniskillen.
Londonderry	522,315	173,906	Londonderry.
Monaghan	319,741	114,969	Monaghan.
Tyrone	806,658	215,766	Omagh.
CONNAUGHT—			
Galway	1,566,352	248,458	Galway.
Leitrim	392,363	95,562	Carrick.
Mayo	1,363,883	246,030	Castlebar.
Roscommon	607,691	140,670	Roscommon.
Sligo	461,796	115,493	Sligo.
Total	20,819,867	5,512,479	

In no country of Europe has there been of late years such vicissitudes in population. In 1801 the population amounted to 5,395,456; in 1811 it rose to 5,937,856; in 1821, to 6,801,827; in 1831, to 7,767,401; and in 1841, to 8,175,124; but sank to 6,552,385 in 1851, and to 5,798,564 in 1861. According to the Registrar-General, the number of emigrants from I. in 1852 was 190,322; in 1857, 95,081; in 1863, 117,229; in 1870, 74,855; and in 1875, 51,462.

Physical Aspect.—The great central portion of I., from Dublin to Galway, and from Tipperary to the shores of Lough Neagh, is extremely flat, and the mountains by which the interior plain is fringed are broken into isolated groups. Not less than 2,830,000 acres of the surface is bog or morass, which is quite uncultivatable, and gives a dreary aspect to the country. The largest single morass is the Bog of Allen (see ALLEN, BOG OF), covering great parts of Meath, King's County, and Kildare. The central plain is traversed by a few low ranges of hills, chief of which are the Slieve-Bloom mountains, rising in Mount Kieper to a height of 2278 feet, and separating the basin of the Shannon from that of the Barrow and Suir. The highest mountains of I. are Macgillicuddy's Reeks in the S.W. (county Kerry), which rise in Carran-Tual, the loftiest peak in the island, to 3414 feet, and in Mangerton, S.E. of Lake Killarney, to 2756 feet; Mount Brandon (3127 feet), the second highest peak in I., is also situated in Kerry to the N. of Dingle Bay. Other ranges are the Mourne Mountains in Down, the highest summit, Slieve Donard, being 2796 feet; Glenocum Mountains in Antrim, 1817 feet high in Mount Trostan, and extending from Belfast to Fair Head; Carntogher Mountains, in Londonderry, attaining in Mount Sawell 2090 feet; the Donegal Mountains, in which the principal peaks are Errigal, 2466 feet, and Blue Stack, 2219 feet; the Nephin-Beg Mountains (2646 feet) in Mayo; the mountains of Joyce's Country (the Twelve Pins, 2395 feet), and of Connemara (Muilrea, 2688 feet), between Clew Bay and Galway Bay; the Slieve Baughta Mountains in the S.E. of Galway; the Vermine Mountains in Tipperary; Galteemore (3007); Knockmeledown (2598) in Waterford; and the group with Lugnaquilla (3039), and Kippur (2473) in Wicklow. The great *rivers* of I. rise in the central plain, and generally string together numerous lakes or *loughs*, while several of them have been rendered navigable almost to their source by means of locks and lateral cuttings. The Shannon is the longest river in I., having a length (with windings) of 220 miles. The rivers that flow from the central plain and empty themselves into the Atlantic on the W. coast are the Shannon, Corrib, Moy, and Erne; on the N. coast, the Foyle and Bann; on the S. coast, the Suir, Barrow, Lee, and Blackwater; on the E. coast, the Slaney, Liffey, Boyne, and Lagan. Internal communication is greatly extended by an artificial water system embracing the Lagan, Newry, Ulster, Royal, Grand, and Athy Canals. The loughs are many and of great extent; Lough Neagh, in Ulster, with an area of 153 sq. miles, being the largest sheet of water in the British Isles. The total area of all the Irish lakes is 984 sq. miles, and the principal of them are Neagh, Corrib, Erne, Derg, Ree, and Mask. On the Shannon are Loughs Derg, Ree, Boffin, Corry, and Allen; on the Corrib are Mask and Corrib; on the Moy are Conn and Cullen; on the Erne are Oughter and Erne. The lakes of Killarney (q. v.), in Kerry, and under shadow of the loftiest mountains in the island, are widely famed for their romantic beauty. The coast inlets are in some cases called loughs, *e.g.*, Loughs Foyle and Swilly, and Belfast and Strangford Loughs.

Climate.—The climate of I. is milder and moister than that of Great Britain, owing to its lying further into the Atlantic, and coming more directly under the influence of the Gulf Stream. The mean temperature in winter is 41°, in spring 47°, in summer 60°, and in autumn 51° F. The difference in mean temperature between N. and S. is only 3° F. The annual rainfall throughout I. is estimated at 40 inches. It is much greater in the W. and S., especially in the mountainous region of Kerry; but at certain points on the E. coast the rainfall scarcely exceeds 25 inches. In winter I. is visited by prevailing S.W. winds, mild and full of moisture, while it is less exposed than Great Britain to the chill easterly winds of spring.

Geology.—The island is divided geologically into three great sections—the central plain of Carboniferous limestone, the Silurian district in the N., and that of the Cambrian rocks, resembling those of N. Wales, in the S. Greatest of these is the central plain, which is occupied by one of the largest aggregates of beds of Carboniferous limestone in the world. The plain is formed by wavy beds of the lower part of the Carboniferous limestone, from which the coal measures, to the thickness of from 2000 to 6000 feet, have been denuded, and which is covered here and there with limestone gravel. Its surface is overlaid with peat-moss and fresh-water marl, in which have been found remains of recently extinct animals. The structure is beautifully exhibited in the hills of Queen's County on the E., and on the W. in the hills of Burren, 1000 feet high, that sweep for some 20 miles along the S. side of Galway Bay. To the S. the limestone is succeeded by a series of black shales, and grey gritstones or flagstones, containing in their upper portion thin coal beds. Cambrian rocks, beds of grit, and slate of dull green, brown, and purple hues, occur in Wexford in the extreme S.E., in Wicklow, and in Howth Head, Dublin county. In Kerry

and Cork the principal rocks are the sandstones and slates of the Devonian age. The northern portion of the country is allied in geological character to the W. of Scotland, the prevailing Silurian rocks being intruded by granite and basalt, *e.g.*, at the Giant's Causeway (q. v.). Here also occur Permian, Cretaceous, and Triassic formations; near Belfast there are beds of gypsum and rock-salt. One of the finest known examples of steady direction of cleavage planes is in the S. of I., over the whole of which, from Dublin to the Mizen Head and the Dingle Promontory, the direction of cleavage, according to Jukes, 'seldom varies 10° from E. 25° N., whatever rocks it traverses.'

Soil and Productions.—The soil of I. is for the most part fit for cultivation, while much of it is singularly fertile. Though there must at one time have been immense forests of oak, as evidenced by the great tracts of bog, the surface is now extremely bare. The moist climate clothes the plains and valleys with the richest pasture, procuring for I. the name of the Emerald Isle. In the S.W. many of the wild plants of the N. of Spain grow. In 1876 there were under all kinds of crops, bare fallow, grass, and permanent pasture, 15,724,954 acres; 1,848,487 of corn crops (incuding beans and peas); 1,363,224 of green crops; 11,652 bare fallow; 1,861,464 grasses, clover, &c., under rotation; 10,507,249 in permanent pasture. The chief crops are barley, wheat, rye, beans, potatoes, turnips, marigolds, and cabbage. Flax is also cultivated to the extent of 130,000 acres, especially in Ulster. The system of cultivation is very defective, though various agricultural schools have been established throughout the country since 1831. The recent Irish Land Act, from which much benefit is expected, provides fixity of tenure, compensation for improvements, and facilities for converting leaseholds into freeholds. In 1875 the number of separate holdings was 585,483, and of these 51,459 were of not more than one acre. The live-stock was as follows in 1876:—horses, 479,000; cattle, 4,113,000; sheep, 4,007,000; and pigs, 1,424,000.

Industries, Commerce, &c.—The most important manufacture of I. is that of linen, of which Belfast is the centre. In the towns on the N.E. and W. muslin-sewing and lace-making are considerable industries. Woollen manufactures are carried on to a limited extent in Dublin, Cork, Waterford, Kilkenny, &c., and there are also industries in woollen and worsted goods, in silk, jute, &c. According to official returns, in 1875 there were in I. 8 cotton factories, employing 3075 persons; 60 woollen factories, employing 1506 persons; 149 flax or linen factories, employing 60,316 persons; 4 hemp factories, employing 341 persons; 11 jute factories, employing 2094 persons; 2 silk factories, employing 400 persons; and 1 worsted factory, employing 12 persons. Of the whole employed inhabitants, 32¼ per cent. are men, and 68¾ per cent. are women. I. has a comparatively large number of coal-pits, but an annual output not exceeding 165,000 tons. There is a considerable amount of whisky-distilling and porter-brewing. The fisheries have of late years greatly declined; in 1846 they employed 20,000 vessels and 100,000 persons; and in 1872 not more than 8000 vessels and 31,000 persons. The seas around I. are singularly rich in cod, ling, hake, herrings, pilchards, &c. The trade of I. is almost entirely with Great Britain, and is mainly in grain, potatoes, cattle, and whisky. In 1871 there were 1776 vessels, of 218,162 tons, and 11,887 men, registered at the ports. The gross receipts of custom for I. amounted to £1,755,487 in 1875.

Railways, &c.—In 1876 there were in I. 2148 miles of railway open for traffic. The total capital contributed up to 1875 was £30,246,175, and the receipts of that year amounted to £2,633,103. The number of private telegraphic messages forwarded in 1875 was 1,434,996.

Education.—The educational returns for I. are less favourable than for any other portion of the United Kingdom. In 1872 36 per cent. of the men and 46 of the women in signing their marriage register were unable to write their names. A system of national education was established in 1845 under the management of a body of commissioners. The principle laid down was one which has not been extended to England and Scotland, viz., that there should be 'united secular, and (when wanted) separate religious instruction.' In 1871 there were 6914 national schools with 1,021,700 pupils, of whom 822,016 were Roman Catholics, 113,227 Presbyterians, and 78,789 Episcopalians. The parliamentary grant in 1871 amounted to £408,388. The 'secular' teaching of the national schools is somewhat coldly regarded by the various Churches, and the Church Education Society has (1870) some 350 schools attended by 52,166 pupils, of whom 44,662 are Episcopalians, 3747 other Protestants, and 3757 Roman Catholics. There are also 587 higher schools with 25,055 pupils. Among the chief educational institutions are Dublin University (q. v.) and the Queen's Colleges (q. v.) at Belfast, Cork, and Galway. Maynooth College (15 miles N.W. of Dublin) is an institution for the training of Roman Catholic priests, supported at public expense, and attended by 520 students. At Dublin there is a Royal Hibernian Military School.

Religion.—According to the census of 1871 there were in I. 4,141,933 Roman Catholics; 683,295 Episcopalians; 558,238 Presbyterians; 41,815 Methodists; 4485 Independents; 4643 Baptists; 3834 Quakers; and 258 Jews. The Roman Catholic Church is under the Archbishops of Armagh, Cashel, Dublin, and Tuam, and twenty-three bishops. The Protestant Episcopal Church of I., formerly in civil union with the Church of England, under two archbishops and ten bishops, ceased to be a state establishment on and after 1st January 1871, by Act of Parliament, 32 and 33 Vict., cap. 42. The endowments have been dispensed so liberally that only a trifling sum will remain after meeting all liabilities. A payment of £500,000 was made to the disestablished Church in lieu of its private endowment, of £372,332 to Maynooth College, and of £90,000 to Nonconformist bodies, leaving in 1875 property valued at £16,750,000. Annuities and other liabilities are estimated to dispose of £11,560,000 of this amount, and there will thus remain a sum of £5,190,000, which is to be devoted to national purposes.

Government.—I. is represented in the Imperial Parliament by thirty-two members of the House of Lords and 105 of the House of Commons. A Lord-Lieutenant is head of the executive government, and is assisted by a Privy Council and Chief Secretary. The judicial system resembles that of England, and has a Landed Estates Court. In I. there are no fewer than 12,000 police, of whom some 400 are mounted.

History.—The ancient traditional inhabitants of I., the Firbolgs and Danauns, are said to have been conquered in early times by the Milesians or Gaels. Almost everything, however, is legendary and uncertain in the history of I. till the 5th c. A.D., when the inhabitants are called Scots. About the time that English invaders were beginning to harry the south coast of Britain, the Scots were passing in fleets of coracles from the coast of Antrim to found the little kingdom of Scotland in the S. and W. of Argyle. Christianity had found its way to I. before the appearance of St. Patrick (q. v.), but it only attained its complete supremacy about a century after his death. The conversion of the Irish at a time when Christianity was struggling for existence in Italy, Gaul, and Spain, raised their country to a position of honour that it has never since known among the nations of Western Europe. Towards the end of the 6th c. extensive monasteries arose throughout the island, and these soon became the illustrious centres of letters and arts. 'The science and biblical knowledge which fled from the Continent took refuge in famous schools, which made Durrow and Armagh the universities of the West.' For the missionary zeal that flamed up a ready field was found among the Frisians of the northern seas and the Picts of the Highlands. Among the more famous of the Irish apostles are Columba (q. v.), Adamnan (q. v.), his biographer, Columbanus (q. v.), founder of monasteries in Burgundy and the Apennines, Gallus, who gave name to the Swiss canton of St. Gall (q. v.), and Ferghal or Virgilius, the evangeliser of Carinthia. The labours of Aidan (q. v.) and the monks of Lindisfarne led to a claim for the annexation of England to the Irish Church that was only reversed by the Council of Whitby in 664. But the Celtic Church, that had risen to power so rapidly, was devoid of regular organisation, and shared the fate of the clan system on which its government was based. By the 12th c. its learning had disappeared, its religion had dwindled into superstition and ascetic exercise, and its spiritual influence was lost in tribal quarrel and ecclesiastical controversy. Its head, the Coarb or Archbishop of Armagh, sank into the hereditary chieftain of a clan; its bishops were without diocese, and often mere dependants of the greater monasteries. But the Church only shared in a general anarchy that it was unable to check. From the earliest times I. seems to have been divided into the four principalities of Ulster, Leinster, Munster, and Connaught, long subject to the central authority of the Ard-righ or King of Leinster, whose territorial possession was Meath, and who usually resided at

Tara. The supremacy of the over-king and even of the minor kingships gradually became merely nominal, while the only recognised institution remaining was the primitive sept, tribe, or clan, whose chieftainship was hereditary, passing not from father to son, but to the eldest member of the ruling family at the time. (See BREHON LAWS.) The incursions of the Danes began about the end of the 8th c., and led to a series of destructive struggles that lasted for three hundred years, and gradually extinguished Irish civilisation. Brian Boroimhe inflicted such a blow on the invaders in his victory at Clontarf near Dublin (1014) as thenceforth restricted them to the coast towns they had founded, Dublin, Waterford, &c., where they remained distinct in blood and manners, at feud with the surrounding tribes, though occasionally forced to pay tribute to the Irish kings. The coast cities had meantime renewed the intercourse of England with I. by the slave-trade, which the Conqueror and Bishop Wulfstan temporarily suppressed at Bristol, and by receiving the ordination of their bishops from the See of Canterbury. The slave-trade had filled I. with kidnapped Englishmen, and defied alike the royal prohibition and the spiritual menaces of the English Church. Henry II. obtained (1155) the sanction of Pope Hadrian IV. to an invasion of I., his ostensible aim being to 'subject the people to laws, to extirpate vicious customs, to respect the native churches, and to enforce the payment of Peter's pence.' The project was abandoned, however, on account of the opposition it met with in a great council of the English baronage. Fourteen years later, Dermot MacMurragh, King of Leinster, appeared at the English court, and did homage to Henry for the dominions from which he had been driven by one of the endless tribal wars. He returned to I. in 1169 with promises of aid, and was soon followed by a band of a hundred and forty knights, sixty men-at-arms, and three or four hundred Welsh archers. The small force proved invincible among the Irish kernes, and Dermot was reinstated, and added to his former possessions Dublin and other eastern towns. Richard of Clare, Earl of Pembroke and Striguil, a ruined baron, surnamed 'Strongbow,' married Eva, Dermot's daughter, and succeeded (1171) to the kingship of Leinster, but to appease Henry was forced to surrender Dublin to the crown, and to do homage for his dominion as an English lordship. In 1172 Henry visited I. with a large force, received homage from all the native rulers save the King of Connaught and the chiefs of Ulster, and was recognised by the bishops as their lord in the Synod of Cashel. Before carrying out his scheme of complete conquest, he was recalled by the troubles in Normandy, but he granted charters to Fitz Gislebert, Le Gros, De Cogan, De Lacy, De Courcy, and other Anglo-Norman adventurers, to take possession of the independent parts of the island by force. De Courcy entered Ulster, and settled at Downpatrick. In 1184 Henry made his youngest son, John, Lord of I., but the levity of the young prince, who mocked the native chieftains and plucked them in derision by the beard, excited disturbances which led to his recall. The invaders, unable to make themselves masters of the island, were hemmed up in what was called the 'English Pale,' comprising the districts of Drogheda, Dublin, Wexford, Waterford, and Cork. All the lawless ferocity of feudalism broke out in the 13th c. under the barons, who observed a mere shadow of fealty to the English crown. The English settlers within the Pale were harried alike by the Irish septs and the baron protectors. John headed an expedition in 1212, and drove the leading barons into exile, but anarchy burst forth again on his departure. The Irish with an allied Scottish force under Edward Bruce, were defeated by the barons on the bloody field of Athenry (1316) with the loss of eleven thousand men, including almost the whole of the great clan of the O'Connors. But from this period the barons sank gradually into Irish chieftains. The statute of Kilkenny (1367) in vain forbade any man of English blood to adopt the Irish name, dress, or language. Richard II. landed with an army of overpowering strength, reduced the whole island to subjection, knighted at Dublin the four over-kings, received homage from seventy-five chiefs, strove to reform the government and enforce improved laws; but the withdrawal of his soldiers was the signal for a return to misrule. Henry VII. adopted the policy of increasing, since he could not restrain, the power of the barons; and when the great Earl of Desmond defied the authority of the Government, he made him Lord Deputy. The Earls of Desmond, the Fitzgeralds or Geraldines, who had acquired unbounded power in E. Munster and Kildare, continued to govern I. in the name of the crown till the accession of Henry VIII., when they were completely overthrown by Skeffington the new Lord Deputy. Their discomfiture was mainly due to the unexpected destruction by a train of artillery of Maynooth, the stronghold from which the Geraldines menaced Dublin. Henry had no sooner subjected the barons than he set himself to the task of 'making Ireland English.' This was to be done gradually, by the enforcement of justice and legal rule. The sole test of loyalty was the acceptance of an English title, and the education of a son at the English court. In 1541 Henry assumed the title of King of I., and the conciliatory scheme was like to win its end, when the island was again plunged into strife by a fatal attempt, continued during the reign of Edward VI., to thrust upon it the Reformation doctrines. The population on both sides of the Pale united in opposition 'as Catholics,' and the old faith was restored by Mary. The slow conciliation of the chiefs, however, gave way to the sterner and speedier policy of supplanting by force the Irish septs by English colonists, as in the case of the O'Connor's country, which was converted into shire-land under the names of King's and Queen's County, in honour of Philip and Mary. The result was a revolt in the N., and the appearance of the valorous Shane O'Neill, the successor to the Earldom of Tyrone, according to Irish law. Shane for a time ably resisted Sussex, and subsequently made a feint of submission at London to Elizabeth, but again revolted with the ambitious hope of adding Connaught to his dominion of Ulster. He was at last signally defeated (1567) by Sir Henry Sidney. In 1579 an attempted Papal rising was fiercely suppressed, a small Spanish force that had landed in Kerry was put to the sword, the Earl of Desmond was defeated, and his estates in Munster were given over to English settlers. But a more formidable revolt (1598) of the great northern tribes under Hugh O'Neill, Earl of Tyrone, who had been brought up at the English court, was only quelled after three years' hard fighting, directed by Lord Mountjoy. A Spanish force which landed at Kinsale had to surrender; a chain of forts was thrown across the conquered country; and the work of devastation was completed by a famine. A death-blow was dealt to the old tribal system by the settlement of the acquired province on the basis of a purely English polity. The chiefs were legally deprived of their tribal authority, and reduced simply to nobles or landowners; the clansmen rose from subjects into tenants, rendering to their lords only fixed dues and services; the English system of judges and trial by jury took the place of Brehon law. In the reign of James I. was effected the great revolutionary measure known as the 'Plantation of Ulster' (1610). Two-thirds of the N. of I., declared to have been confiscated to the crown, was cleared of Irishry and allotted to new Scotch and English settlers, and the foundation laid of the subsequent industrial prosperity of Ulster. Strafford by his system of 'Thorough' (1633) weakened and cowed I. for a time, but in playing off religious parties against each other he stirred the passions which found vent in the Irish massacre of some 40,000 Protestants in 1641. The revolt that followed was crushed out by Cromwell, in whose vengeful campaign the more memorable incidents are the taking of Drogheda, and the ineffectual siege of Waterford. The revolutionary wars raged in I. for four years (1688–72), the native Irish siding with James II. William's most brilliant success was the battle of the Boyne (1690); the determined but hopeless defence of Limerick was the last display of national bravery. For the next hundred years I. remained passive under a terrible legal tyranny. The more stringent penal statutes against the Catholics were repealed too late to hinder the rebellion of 1798, which was suppressed at Vinegar Hill. The Act of Union with Great Britain passed into law 1st January 1801, and from this date the history of I. merges in that of Great Britain (q. v.). Important circumstances and phases of later Irish history are also described in such articles as CATHOLIC EMANCIPATION, FENIANISM, O'CONNELL. See *The Annals of the Four Masters*, edited by Dr. O'Donovan (Dubl. 1856); Dr. Lanigan's *Ecclesiastical History of I.* (Dubl. 1829); Professor O'Curry's *Lectures on the Materials of Ancient Irish History* (Dubl. 1861); Froude's *English in I. in the Eighteenth Century* (3 vols. Lond. 1872–74); and other authorities given in Green's *Short History of the English People.*

Ireland, Law Regarding. Since the legislative incorporation with Great Britain, taking effect from 1st January 1801,

other measures have been adopted for uniting the interests of the two countries. In 1819 an Act was passed for consolidating the exchequers of England and Ireland. By 6 Geo. IV. c. 79 the currency of Ireland is assimilated to that of Great Britain, and all mercantile and pecuniary transactions are to be done in the currency of the United Kingdom. By the Catholic Emancipation (q. v.) Act, the disabilities to which the great majority of the Irish population had been subjected were removed. The Acts for facilitating the sale of encumbered estates having proved beneficial; their provisions were amended in 1858, and a permanent court erected for the sale and transfer of land. 26 Vict. c. 11 introduced a complete system of registration of births and deaths. 36 and 37 Vict. c. 21 abolished tests in Trinity College and in the University of Dublin. 32 and 33 Vict. c. 42 dissolved the union between the Churches of England and Ireland from 1st January 1870, and abolished the right of Irish bishops to sit in the House of Lords.

Irenæ'us, St., Bishop of Lyon, one of the most famous of the 2d c. fathers, was an Asiatic Greek, born probably at Smyrna between the years 120 and 140. He was a disciple of Polycarp, who is supposed to have sent him to Gaul as presbyter to Pothinus, the founder of the churches of Lyon and Vienne. On the martyrdom of the latter (177), I. succeeded him in his bishopric, which he held until 202, when, according to tradition, he was himself beheaded in the persecution of Severus. He made many converts from heathenism, was an active opponent of the Gnostics, and in the controversy between the Eastern and Western Churches as to the time and manner of celebrating Easter (q. v.), addressed a moderate letter to Pope Victor, which aided the postponement of the question until the Council of Nicæa (325). We possess but one of I.'s writings in its entirety, *Adversus Hæreses*, and that in a barbarous Latin translation of the 4th c. It was published first by Erasmus (Basel, 1526), and again with the fragments by Gallasius (Par. 1570), but the best edition is that of Grabe (Oxf. 1702).

Ire'ne (Gr. *eirēnē*, 'peace'), a Byzantine empress born about 752 at Athens. At seventeen she became the wife of Leo, son of Constantine V., who was fascinated by her beauty, and in 780 she succeeded Leo as ruler, during her son Constantine VI.'s minority. One of her chief aims was to restore image-worship in the Eastern Empire, which she effected through a council at Nicæa in 789. Her son at length flung off her authority and became emperor in 790, but I. in 797 contrived to gain imperial power, and caused him to be blinded. 'For five years,' says Gibbon, 'her reign was crowned with external splendour; and if she could silence the voice of conscience, she neither heard nor regarded the reproaches of mankind.' She is said to have offered herself in marriage to Karl the Great, who rejected the proposal. I. ruled with considerable ability until 802, when she was deposed by her grand treasurer, Nicephorus, who banished her to Lesbos, where she was forced to maintain herself by spinning, and where she is said to have died of grief in 803. She has been canonised by the Greek Church. See Gibbon's *Decline and Fall of the Roman Empire* (ch. xlviii.).

Ire'ton, Henry, one of Cromwell's generals, belonged to a Nottinghamshire family, was born in 1610, educated at Cambridge, and became a lawyer. In the Civil War he took the side of the Parliament, and his legal skill was of much service to his party. He fought at Naseby, and became one of the most trusted lieutenants of the Protector, a daughter of whom he married. He signed the King's death-warrant, and succeeded Cromwell in the chief command in Ireland in 1649, governing with severity. He died of fever at Limerick, November 26, 1651, and was buried at Westminster. At the Restoration his corpse was disinterred, and burned at Tyburn. He was austere and fanatical, but of upright, incorruptible character.

Iriar'tia, a small genus of handsome and singular *Palmæ*, with stems supported on a cone of emersed prickly roots. *I. exorrhiza* is one of the commonest Amazon palms. Well-grown plants of *I. ventricosa* are from 60 to 100 feet high, with the cone of exserted roots 2 to 12 feet. Canoes are sometimes extemporised from the bellied trunk by splitting off lengthwise a little less than half of it, hollowing out the remainder and stopping up the ends with clay. From a slender little species of the Rio Negro region—*I. setigera*—the natives commonly make their blowing-canes.

Irid'eæ, or Irida'ceæ, an order of monocotyledoneous herbaceous plants with tuberous roots or creeping root-stock, narrow leaves, and generally handsome flowers springing from spathe-like bracteæ; chiefly extra-tropical in their distribution, and numbering about fifty genera and five hundred species. The British representatives of the order are Crocus, Iris, Gladiolus, Trichonema. Along with these numerous foreign genera furnish some of the best-known florist's flowers, *e.g.*, Ixia, Tritonia. At the Cape the order is abundantly represented, not confined to any one district, soil, or elevation, but abounding from one end of the colony to the other, and covering the ground in the months of September and October with a sheet of blooms 'that resemble nothing so much as a shower of gaudy butterflies.'

Irid'ium, an element discovered by Smithson Tennant in 1804 along with osmium, in the residue of the action of aqua regia on crude platinum. On account of the variety of colours assumed by its compounds it was called I. (from Gr. *iris*, 'the rainbow'). It is a scarce metal, being found associated with platinum and osmium in certain rare minerals. I. is a hard, brittle, white metal; specific gravity, 21·15. It is not acted on by acids; but when heated with nitre it gradually oxidises and dissolves. It forms three chlorides, $IrCl_2$ (the protochloride), $IrCl_3$, and $IrCl_4$, with corresponding oxides and sulphides. On account of its hardness it has been used for pointing gold pens. The combining weight of I. is 198.

I'ris, a genus of beautiful, hardy perennials belonging to Irideæ (q. v.), of which many varieties are commonly cultivated in gardens, and one species, under the name of yellow flag, is a well-known ornament of our British river-banks, ditches, &c. A rarer English species is met with in chalk and limestone districts, on hedge-banks, and in copses, called *I. fœtidissima*, from the nauseous smell emitted by the plant when bruised. In contrast to this, *I. florentina*, a species of the Mediterranean region, yields the violet-scented Orris-root (q. v.). The old name of flower-de-luce, applied to this genus, is a corruption of fleur-de-Louis, a white-flowered I. (so supposed), being the shield-device adopted by Louis VII. of France.

Iris Pseud-acorus.

I'ris, in Greek mythology, is the daughter of Thaumas and Electra, the parents of the Harpies, a virgin goddess, who is given in the *Iliad* as the messenger of the gods, an office held in the *Odyssey* by Hermes. In the later poets she appears as the wife of Zephyrus and mother of Eros. No antique statues of I. exist, but in the bas-reliefs and on vases she is usually a young maiden with winged shoulders, dressed in a light upper garment with a long, loose robe beneath, and bearing a herald's staff and flower. The conception of I. as messenger of the gods doubtless arose from a personification of the rainbow, appearing suddenly and as suddenly 'evanishing amid the storm,' and regarded as a bridge uniting earth and heaven.

Iris, in physiology, is a muscular curtain in the eye, perforated by a hole known as the pupil. (See EYE.) The I. is formed of involuntary muscular fibres arranged in two sets—(1) A radiating set, under the control of the sympathetic nerve, which on contraction dilate the pupil; and (2) a circular set, found chiefly near the margin of the pupil, under the control of the third cranial nerve, which have the effect of contracting the pupil. These fibres, through their nervous supply, are stimulated to contract by the action of light on the retina of the eye. Thus the amount of the dilatation of the pupil is regulated by the strength of the stimulus of light. With a strong light the pupil contracts, and with a weak light the pupil dilates. Certain substances have a definite action on the I. Thus atropine, the

active principle of Belladonna, dilates, while physostigmine, the active principle of Calabar bean, contracts it. The functions of the I. are—(1) to regulate and moderate the amount of light passing into the eye; (2) to correct the defect of spherical aberration by cutting off the outer rays of the pencil of light; (3) to assist in accommodation for near objects by contracting and thus cutting off the outer divergent rays. Without the intervention of the I., these outer rays would, by the sphericity of the cornea and lens, be brought to a focus in front of the retina, and thus there would be an uneven or blurred image. See EYE.

I'rish Language and Literature. The Celtic language is divided into two great branches, the Cymric and the Gaelic, the latter of which embraces the three varieties popularly known as Irish, Scotch, and Manx Gaelic. It is a matter of dispute whether these three should be treated as mere varieties or as distinct dialects. There are differences of such importance both in vocables and in grammatical structure between Irish and Scotch as to make the term 'dialect' applicable to each; but Manx, having adopted a phonetic system of writing, and renounced everything specifically characteristic of Gaelic except the mere words, is undeserving of such a distinction. Here we confine ourselves chiefly to the Irish. Several antiquaries maintain that pagan Ireland possessed an alphabet of its own, and speak much of an 'Ogham character,' as well as of a *Beth-Luis-Nion* alphabet; but the writing, though unquestionably old, belongs to Christian times, and is really in the Roman character of the 5th c., modified slightly in some instances. The Irish, however, adopted only eighteen of the Roman letters, rejecting j, k, q, v, w, x, y, z. The Scotch also reject these, while the Cymric and Manx use the modern English alphabet with its twenty-six letters. Both dialects agree in a peculiarity known to no other branch of the Aryan language, viz, that the harmony of vowels requires, if the vowel of the first syllable of a word be broad, that in the next syllable must also be broad, and *vice versâ*—a troublesome rule unknown of old, condemned by grammarians, but observed by all later writers. Both are now destitute of a neuter gender, though they formerly used it. In both, the terminal inflections of nouns and verbs are very few, while initial inflection, the special characteristic of the Celtic, prevails to a great extent, the first letter of a word being modified by the preceding word. In Irish this is known as *eclipsis* and aspiration. In writing Gaelic several combinations of consonants are used, which, according to the present mode of pronunciation, are entirely mute, and strangers consider these combinations as formidable obstacles to the mastering of the language. The truth is, however, that these groups of letters, necessary for preserving any trace of etymology, are to the ear simple and uniform, each combination invariably preserving its own distinctive sound, and such anomalies as occur in English, where we have one group, *e.g.*, *ough*, sounded as in *dough*, *plough*, *through*, *enough*, are never met with in Gaelic. Poetry was cultivated with very great care both in Ireland and Scotland, and while final rhymes, as in English, are not unknown, the prevailing rhythm of Gaelic poetry is 'assonance' as distinguished from 'consonance,' *i.e.*, a correspondence between the vowel sounds quite regardless of the consonants. This correspondence is often between the final syllable of one line and the middle syllable of the next; but whatever be the position of the assonants, the number of feet in the line is attended to with the utmost regularity.

Poets were generally treated in ancient Ireland with the highest respect, and enjoyed very valuable privileges. An *Ollamh*, the highest literary degree or title in philosophy, sat at the table next to the king, and the lower degrees possessed corresponding honours which are too numerous to specify here. An immense quantity of ancient Irish MSS., ranging from the 8th to the 17th c., is still preserved. The oldest MSS. speak of still older ones, which now are unfortunately lost, and thus it is probable that, at least from the introduction of Christianity into Ireland (5th c.), native literature was carefully cultivated. Professor E. O'Curry, the highest authority, says that in the libraries of Trinity College, Dublin, and of the Royal Irish Academy alone, there is to be found what, if printed, would fill 50,000 quarto pages. In Oxford, in Cambridge, in the British Museum, in the Vatican Library, Rome, in that of the Cathedral of Milan, in the monasteries of Bobio, Wurzburg, and St. Gall, as well as in many private collections at home and abroad, there are thousands more to be found. The contents of these MSS. are extremely varied, including martyrologies, festologies, treatises on scientific subjects, translations from the classics, genealogies of all the distinguished families in Ireland, and innumerable romantic tales in prose and in verse. The most valuable, however, are historical annals, civil and ecclesiastical, and the Brehon Laws (q. v.), several volumes of which are now published with an English translation and notes. The close of the 18th c. witnessed the death of the Irish tongue as a vehicle of literary composition; but Irish wit, humour, pathos, and melody are immortal, and even in the alien tones of the English tongue we can recognise the exquisite and fascinating qualities of the national genius. Goldsmith, Burke, Sheridan, Moore, Banim, Carleton, Lever, Mahony (Prout), &c., have adorned the muses of Albion with fresh grace and splendour. Though no longer a literary dialect, the I. L. is spoken by nearly three millions in Ireland, and by many hundreds of thousands in America and Australia.

Among the scholars who have recently distinguished themselves by their knowledge of Gaelic are Whitley Stokes, Drs. Everet, Petrie, O'Donovan, Reeves, O'Connor, Professor O'Curry, and notably the German Zeuss. His *Grammatica Celtica*, O'Donovan's *Irish Grammar*, and O'Reilly's *Dictionary* will be found useful to the learner; but O'Curry's *Lectures* are *the* authority on ancient Irish literature.

Irish Moss. See CARRAGEEN.

Irish Sea, separating in part Ireland from England, lies between the North Channel in the N. and St. George's Channel in the S., and extends to a breadth of 150 miles between Dundalk and Morecambe Bays. It forms a vast inlet on the English coast, contains the Isles of Man and Anglesey, and attains a depth of 80 fathoms.

Iri'tis is the term applied to inflammation of the iris, the muscular structure which divides the cavity of the Eye (q. v.) into an anterior and posterior chamber. The iris is composed of muscular fibres, nerves, and blood-vessels, cellular tissue, and a pigmentary and serous membrane; and the inflammation to which it is generally subject is of the adhesive kind, so that in the course of a neglected or misunderstood attack of I. the pupil may become obliterated by an effusion of coagulable lymph, causing permanent blindness unless relieved by an operation. The most prominent symptoms of I. are (1) pain in the eye and round the orbit, generally most intense at night; (2) contraction, irregularity, or a fixed state of the pupil; (3) discolouration of the iris, from increased vascularity and effusion of lymph; (4) effusion of lymph into the pupil and posterior or anterior chambers; (5) adhesion of the iris to the capsule of the lens, or to the cornea; (6) tubercules, pustules, or abscesses of the iris; (7) opacity of the lens or its capsules, causing (8) dimness of sight or blindness. The most frequent causes of I. are sudden changes from heat to cold, exposure to cold draughts, overuse of the eye on minute objects, especially by artificial light. I. frequently depends also on constitutional syphilis and scrofula, and on gonorrhœa, followed by synovitis, operating through the constitution. I. may depend also on actual injury, and is a concomitant of other diseases of the eyeball. In the *first stage* of I. there is increased vascularity of the cornea, discolouration of the iris, inactivity of the pupil, dimness of sight, and pain. In the *second*, there is dimness of vision, from effusion of lymph into the pupil, and contraction thereof, abscesses, adhesions, and increase of pain. In the *third*, there is obliteration of the pupil, opacity of the lens, insensibility of the retina, flattening of the eyeball, and protrusion of the choroid through the sclerotica. The treatment of I. has for its objects to subdue the congestion, to prevent the effusion of lymph or promote its absorption, to prevent the contraction of the pupil, or to dilate it if contracted, and to alleviate pain. To attain such ends, recourse is had to blood-letting and counter-irritants, the use of cathartics and diuretics, nauseants and opiates, mercury, and the iodide of potassium. Belladonna is necessary, in nearly all cases, for the purpose of dilating the pupil.

Irkutsk', a Russian government in Eastern Siberia, is bounded E. by Jakutsk, Trans-Baikal and Lake Baikal, S. by Chinese Mongolia, E. by Jeniseisk, and N. by Jakutsk. Area, 309,108 sq. miles; pop. (1870) 703,950. It is very mountainous, and is watered by the Lena, and the Angara, the upper stream of the Jenisei. The chief products are gold, silver, lead, precious stones (amethysts, emeralds, jasper, topaz), and furs, including those

of the reindeer, sable, fox, seal, and ermine. The inhabitants are mainly Buriats, Tunguses, and Russians.—I., the capital, lies at the confluence of the Irut and the Angara, and has a pop. of 22,800. It is one of the chief trading towns in Siberia, a centre of Russian administration, and has an active commerce with China. Lying 1200 feet above the sea-level, it has a healthy climate, but the winter cold is intense.

Iron (Old Eng. *iren;* Ger. *eisen;* connected with Lat. *aes*, 'bronze') is the most important of all metals. It is rarely found native, but in combination with oxygen and other elements its presence is universal over the earth's surface. The metal is obtained from its ores by a lengthened series of processes afterwards described. When pure, iron is white and extremely soft and tough, with a specific gravity of 7·8. It is the most tenacious of all metals, and is difficult of fusion. In its normal state it is strongly magnetic, but loses its magnetism when heated to a dull red. Iron does not oxidise in air at ordinary temperatures, but when heated to redness becomes covered with a coat of black oxide. It, however, speedily tarnishes when in the presence of both air and water, the *rust* which is produced being a hydrate of the sesqui-oxide. Iron gives rise to two series of salts, known as the *ferrous* (Lat. *ferrum*, 'iron') and *ferric* salts. The ferrous chloride ($FeCl_2$) produced by acting upon iron with dilute hydrochloric acid may be taken as the type of the former, and ferric chloride (Fe_2Cl_6) prepared by dissolving ferric oxide in hydrochloric acid as the type of the latter. The corresponding oxides are FeO and Fe_2O_3; but besides these there is an intermediate oxide, commonly called *magnetic* or *black* oxide, having the composition Fe_3O_4. Ferrous oxide is a powerful base with a strong tendency to absorb oxygen and pass into the ferric or sesqui-oxide. The soluble ferrous salts have usually a pale green colour and a disagreeable metallic taste. The most important of these salts is the ferrous sulphate ($FeSO_4$, $7H_2O$), known also as *green vitriol* and *copperas*, which may be obtained by dissolving iron in dilute sulphuric acid. It is generally obtained on a large scale, however, from iron pyrites, the mineral ferric sulphide (FeS_2), which oxidises readily in the presence of moisture. It forms double salts with the sulphates of potassium and ammonium, which have the formulæ $FeK_2(SO_4)_2 6H_2O$ and $Fe(NH_4)_2(SO_4)_2 6H_2O$. The salts are isomorphous with the corresponding Magnesium (q. v.) salts. *Ferrous Nitrate* ($Fe(NO_3)_2$) is prepared by the action of dilute nitric acid upon ferrous sulphide (FeS). It forms pale green and very soluble crystals. *Ferrous Carbonate* ($FeCO_3$) occurs in nature as *spathose iron ore* or *iron spar*. It may be obtained as a whitish precipitate by mixing solutions of a ferrous salt and an alkaline carbonate. The *ferrous sulphide* (FeS) is a blackish brittle compound formed by heating iron and sulphur together. It evolves sulphuretted hydrogen (H_2S) when acted on by dilute acids, and for this purpose is constantly employed in the laboratory. *Ferric oxide* (Fe_2O_3) is a feeble base. It is the main constituent of red and brown Hæmatite (q. v.). As a fine powder this oxide is bright red, and is accordingly used as a pigment. It forms ferric salts, which are reddish in colour and have an acid reaction. They are not of great importance, the best known being the ferric sulphate ($Fe_2O_3 3SO_3$), which with sulphates of potassium and ammonium yields salts resembling in form and constitution the alums (see ALUM), the ferric nitrate, which is deep red in colour and used in dyeing, and the ferric sulphide (FeS_2), which occurs in nature as iron pyrites, the material chiefly employed in the manufacture of Sulphuric Acid (q. v.). (See PYRITES.) Iron is also a constituent in the important salts known as the ferro-cyanides and ferri-cyanides. (See FERRI-CYANOGEN and FERRO-CYANOGEN.)

Metallurgy of I.—The art of extracting iron from its ores has been known and practised from a period anterior to historical record, although it was not the first metal used by the human race. The production of metallic iron on a small scale is a very simple operation, and the primitive process by which it was extracted is yet prosecuted among the rude tribes of Central Africa, who thereby produce malleable iron of a very superior quality. The direct production of malleable iron from ores is still also among civilised communities an operation of some importance, being carried on in the N. of Spain and the S. of France, in India, and also in the United States and Canada. The type of the processes carried on in all these localities may be found in the Catalan forge of Spain, which consists of a hearth or furnace built of refractory sandstone into which the ore to be reduced is piled. The ore is covered over with charcoal, and when the furnace is in operation it is supplied with a blast by a nozzle passing through a wall built in the rear of the furnace. In this case the reduction of the metal from its ore—an oxide—is effected by the action of the carbonic oxide formed by the combustion of the fuel.

Iron is prepared and employed in the three different conditions of cast or pig iron, malleable iron, and steel, all of which possess properties so distinct as to give them the practical value of different metals. Pig-iron results from a combination of the metal with from 2 to 6 per cent. of carbon; malleable or wrought iron is almost free from carbon; and steel is intermediate in composition and properties between the other two, while it possesses the peculiar property of being hardened or softened at will by the process of *tempering*. In modern metallurgy, the ordinary method of manufacture is first to extract the metal in the form of pig or crude cast-iron. Pig-iron in its turn forms the basis from which both malleable iron and steel are formed. Till within very recent times steel was prepared only from malleable iron by recombining with the metal a portion of the carbon previously extracted from it in its conversion from pig into malleable iron. Now, by the Bessemer and other processes hereafter alluded to, steel is very extensively prepared direct from pig-iron without passing the metal through the processes necessary for the production of malleable iron.

Iron ores occur widespread over the globe in great abundance, although the varieties used by smelters are not numerous. Those of greater importance are carbonates of iron, generally associated in seams or nodular masses with coal deposits. The clayband or argillaceous ores and the blackband ores of Great Britain are carbonates of iron combined respectively with more or less of clayey or carbonaceous impurities, whence their names. From these alone the greater part of the iron smelted at the present day is produced. The Cleveland ore, worked in the N. of Yorkshire, and the spathose, or sparry ore, are also carbonates, and form extensive and important sources of iron. Of the oxides which are used to yield iron, the varieties of Hæmatite (q. v.) are the most important; magnetic iron ore—magnetite or loadstone—is a very valuable ore in Sweden and the N. of Europe generally, being the source of the greater part of the famous Swedish bar-iron, from which the finest quality of crucible cast-steel is prepared. Iron pyrites, the impure sulphide of iron, is also now to some extent a source of metallic iron after yielding its sulphur for sulphuric-acid-making, and in the case of Spanish ores being further treated by the wet process for the extraction of copper.

Production of Pig-Iron.—When, instead of smelting ore on a low or open hearth, a furnace of a lofty conical form is employed, the metal thereby obtained is in the condition of cast or pig iron. The blast-furnace, in which pig-metal is produced, is a comparatively modern invention, but except in the few cases of manufacturing malleable iron by the direct method already alluded to, it is now exclusively used for smelting from the ores. The most important and valuable invention of modern times in connection with the blast-furnace was the introduction of the hot blast by Neilson of Glasgow in 1828. The immediate result of the application of the hot blast was that whereas formerly 8 tons of fuel were required to produce 1 ton of pig-iron, by the year 1833 the same weight of iron was obtained with the expenditure of 2 tons 13 cwt. of coal. Now 1 ton of pig-iron can be produced by the use of from 17 to 20 cwt. of fuel. No improvement of subsequent introduction, although many of them have been of great importance and value, has affected the principles upon which the operations of the blast-furnaces are conducted. (See BLAST-FURNACE.) In smelting blackband or clayband, the ore is first broken into large pieces, and calcined generally in heaps in the open air. Alternate layers of fuel, calcined ore, and limestone flux are then introduced into the furnace, which is constantly kept filled to the 'throat.' The combustion of the fuel in the lower part of the furnace produces carbonic acid, liberating thereby an enormous heat. The ore at that point is reduced to the metallic condition, and sinks to the bottom of the furnace. In its progress upwards, the carbonic acid, meeting fresh fuel, is reduced to carbonic oxide, by which the temperature of the gas is much decreased; but meeting next the metallic oxide of the ore, it is again changed into carbonic acid, with a simultaneous production of metallic iron; and so

changes go on throughout all the layers in the stack, carbonic acid being given off from the limestone in the upper part of the furnace. The working of a blast-furnace is continuous, and the periods at which the metal is withdrawn varies according to circumstances. The capacity of furnaces and the amount of iron they produce per week also vary very widely, some containing only about 1000 cubic feet of space, while the cubic contents of others measure 30,000 feet and upwards, a pair in the Cleveland district having a capacity of no less than 41,149 feet. The yield of pig-iron per day ranges from 20 to 80 or 90 tons; and three furnaces of the largest capacity now produce in a given time more iron than was manufactured in the whole country little more than a century ago. A furnace of 7500 cubic feet capacity consumes about 5400 feet of air per minute or 1700 tons per week, a weight considerably in excess of its total solid contents. Four principal varieties of pig-iron are generally recognised, numbered 1, 2, 3, and 4, respectively. The first is dark grey in colour, with large crystalline grains in its structure, soft and very fluid when melted, and it forms the best 'foundry pig.' No. 2 is also grey, with smaller crystals, soft, and from its liquidity when melted suitable also for foundry purposes. No. 3 is mottled in appearance, and intermediate between 2 and 4; and No. 4 is hard, brittle, and white in fracture, and melts only imperfectly. Nos. 3 and 4 are converted into malleable iron. The brands of different makers possess distinctive qualities, and in some districts the pigs are differently classed into six varieties.

Malleable Iron Manufacture.—Ordinary pig-iron, in addition to the carbon in its composition, contains a small percentage of silicon, sulphur, phosphorus, and other impurities, a large proportion of which along with the carbon is removed in the operations by which the pig is converted into malleable iron. These substances are got rid of by the action of oxygen on the molten metal. The pigs are usually first *refined* in a *finery* furnace, in which charges of a little more than a ton of the metal are melted under the influence of a cold blast. In the process, which occupies about two hours, almost the whole of the silicon and phosphorus and much of the carbon are removed. The refined metal is next introduced in small charges into the puddling-furnace, which is of the reverberatory kind, and in it the mass is again brought into a state of fusion. It is periodically stirred up to promote the oxidation of the carbon and remaining impurities, and gradually it swells up and becomes a stiff granular mass. In the later stage of puddling the heat is forced and all air carefully excluded, after which the puddler collects on the end of an iron rod a mass as heavy as he can manipulate, which is called a *bloom*. The bloom is hammered either under a steam-hammer or squeezed in a *shingling* press to remove the slag mixed with or adhering to the iron. The metal is then passed through the grooved rollers of a rolling-mill to draw it out into bars. The bars are cut into pieces, piled in a reverberatory furnace and heated to the welding-point, and again passed through the rolling-mill. This operation is repeated several times in the production of fine iron, and in the final stage it is passed between rollers having grooves of the section T, angle, bar, round, rail, or other, in which the metal is to be finished. The refining process in the manufacture of malleable iron is now frequently omitted, and the pigs are carried direct to the puddling furnace. The process when the finery operation is omitted is called *pig-boiling*. Much attention has been devoted of late years to the question of mechanical puddling of iron, and several processes for avoiding the severe manual labour of the old method have been devised, the most important being that of Mr. Danks, an American.

Malleable Cast-Iron, a preparation which has now come into extensive use, and in which certain advantages of both varieties are combined, is prepared by packing iron castings in powdered hæmatite and exposing them to a red heat for some time. Thereby the oxygen of the hæmatite removes a certain proportion of the carbon of the cast-iron, producing a skin of malleable iron, thick in proportion to the duration of the operation. The process of preparing malleable cast-iron is thus exactly the converse of the case-hardening of malleable iron, which operation consists of giving a skin of steel to malleable iron by exposing it to heat packed in charcoal. For the manufacture of steel see STEEL.

Statistics of the Iron Trade.—In 1874 the total quantity of iron ore smelted in Great Britain amounted to 15,854,077 tons, of which 14,844,936 tons were raised in the United Kingdom, the remainder having been imported. The quantities of pig-iron produced in the same year, and the number of furnaces in blast, were as follows:—

	Pig-iron in tons.	Furnaces in blast.
England	4,417,139	430
Wales	766,592	96
Scotland	807,677	123
Total, .	5,991,408	649

Owing to the depressed state of the iron trade in Great Britain, the above number of furnaces in blast falls short by one-third of the number of furnaces *built*.

The United Kingdom exported in 1875:—

	Tons.	Value.
Iron, pig and puddled . . .	947,827	£3,449,916
Bar, angle, &c.	276,068	2,725,907
Railroad	545,781	5,453,836
Tinned plates	138,363	3,686,607
Steel, unwrought	29,858	1,073,733
Iron, cast or wrought . . .	239,869	4,342,492
Hoops, sheets, and boiler-plates .	204,483	3,304,148
Old iron and wire	63,831	782,874
Combined steel and iron wares .	11,026	827,754
Total, .	2,457,306	25,647,267

And imported during the same period:—

	Tons.	Value.
Iron, unwrought bars . . .	89,822	£1,320,059
Wrought iron and steel . . .	1,159,762	1,422,799

The above statistics are exclusive of the export of machinery, the value of which in 1875 was £11,058,647. The steam-engines exported alone amounted to £2,631,333.

Iron Bark, the name popularly given in Australia to different species of Eucalyptus (q. v.), on account of the extreme hardness of their bark. The species number about a dozen, and are distinguished by the colonists according to the smoothness of their bark and the size of their leaves. *E. resinifera* may be taken as the typical species. The average height of the trees is from 80 to 100 feet, and their circumference sometimes reaches 25 feet. Their timber is very strong and durable, and is in high repute in Australia for shipbuilding, piles for wharves, &c.

Iron Cross, a Prussian order, founded March 10, 1813, by Friedrich Wilhelm III. as a mark of distinction for services in the War of Liberation. The knights of the I. C. consist of two classes besides the possessors of the grand cross, which is only obtained by the gainer of a great victory, or the successful besieger or heroic defender of a fortress. The decoration consists of a black cast-iron cross, mounted with silver, bearing the flourish F. W., the date 1813, the imperial crown, and a wreath of oak-leaves. The order was renewed on the occasion of the French war of 1870.

Iron Crown (of the Lombard kings). Few questions have been more warmly contested by the older writers than the significance of the crown assumed by the Holy Roman Emperors at Aachen, Monza, and Rome. 'They tell us,' says Dr. James Bryce, 'that the Roman was golden, the German silver, and the Italian iron, the metal corresponding to the dignity of each realm.' 'There seems to be no doubt,' adds the same writer, 'that the allegory created the fact, and that all these crowns were of gold or of gilded silver.' The distinctive feature of the crown of the Lombard kings is a strip of iron passing round the inner circumference, which tradition held to have been forged from a nail of the true cross. The outer circle of the crown, composed of a band of gold, is adorned with sapphires, rubies, and emeralds, set in blue enamel. When Henri, Count of Luxemburg, received (in 1310) the imperial title, he also won the I. C. In May 26, 1805, when Napoleon entered Milan, he placed it on his own head, pronouncing the formula used by the Lombard kings on these occasions, 'God hath given it me;

beware who touches it.' He also founded an order of knighthood named from the I. C., which, having disappeared, was revived (in 1816) by Emperor Franz I. The crown, removed by the Austrians (1859) to Mantua, is now in Vienna.

Iron Mask, Man with the (Fr. *L'homme au masque de fer*), the name given to a state prisoner confined in the Bastille by Louis XIV., concerning whose identity fifty-three writers have advanced no less than twenty-six different hypotheses. Of documents put forward as contemporaneous and serving to elucidate the mystery, some are certainly fictitious, others only questionably refer to this particular prisoner, and three alone are of indisputable authenticity. These are two passages from the journal of Dujonca, lieutenant of the king at the Bastille, and an entry in the burial registers of the church of St. Paul, all three preserved in the archives of the Arsenal, and first published by Père Griffet, confessor to the Bastille, in his *Traité des Différents Sortes de Preuves qui servent à établir la Verité dans l'Histoire* (Liége, 1769). From them we gather that on Thursday, 18th September 1698, St. Mars, the new governor of the Bastille, arrived from the Ile Ste. Marguerite, bringing with him a prisoner (name unknown) *whom he had formerly guarded at Pignerol* (of which fortress St. Mars was governor from 1664 to 1681), and whose face was always concealed by a black velvet mask; that this prisoner died 19th November 1703, and was buried on the 20th in the cemetery of St. Paul, his name being given in the register as 'Marchiali,' and his age as 'forty-five or thereabouts.' Who was this prisoner? He has been identified with such well-known historical characters as (1) Louis de Bourbon, Comte de Vermandois, a natural son of Louis XIV. and Mademoiselle de la Vaillière (born 2d October 1667, died at Courtrai, 18th November 1683)—in the anonymous *Mémoires Secrets de Perse* (Amst. 1745), the earliest work upon the subject, followed by Père Griffet; (2) François de Vendôme, Duc de Beaufort (born January 1616, killed in Candia, 25th June 1669)—by Lagrange Chancel in *L'Année Littéraire* for 1759, followed by a writer in *All the Year Round* (1876); (3) James, Duke of Monmouth (q. v.) (beheaded at London, 15th July 1685)—by Saint-Foix, in *L'Année Littéraire* for 1768, a theory adopted by M. de Sévelinges in the article 'Monmouth' of Michaud's *Biographie Universelle*; (4) Fouquet, the celebrated Superintendent of Finances (born 1615, died a prisoner at Pignerol, March 22, 1680)—in *Loisirs d'un Patriote Français* (Par. 1789), followed by M. Paul Lecroix in his *Histoire de l'Homme au Masque de Fer* (Par. 1840); (5) Arwediks, an Armenian patriarch (kidnapped 1706, imprisoned at Marseille, Mont St. Michel, and the Bastille, and died a Catholic, at Paris, July 21, 1711)—by the Chevalier de Taulès in his *L'Homme au Masque de Fer* (Par. 1825), followed by Hammer, the German historian. Again, imaginary personages have been evoked to fit the character. In 1754 some Dutch savants tried to prove that the M. with the I. M. was (6) the true father of Louis XIV. (born 5th September 1638), while by Cubières in the *Voyage à la Bastille* (Par. 1789) he was affirmed to be (7) the twin-brother of that sovereign, from whose marriage with the daughter of a gaoler, Bonpart, Las Cases (q. v.) actually derived the Bonaparte family. Others have seen in him (8) an elder brother, the son of Anne of Austria by an unknown father, conjectured by Luchet in *Remarques sur le Masque de Fer* (1783) to have been no other than the Duke of Buckingham (q. v.), who last met the Queen in the June of 1625. This theory of an elder brother, started by the editor of the seventh edition of the *Dictionnaire Philosophique*—probably Voltaire himself, who had already discussed the question, without hazarding an opinion, in his *Siècle de Louis XIV.* (Berl. 1751) and *Essai sur les Mœurs*—is favoured by Michelet in his *Histoire de France*, vol. xii. p. 435, and has been popularised by Dumas in the *Vicomte de Bragelonne*.

All these theories were regarded as superseded by that which made the M. with the I. M. a minister of Duke Charles IV. of Mantua, one Ercole Antonio Matthioli, who, having deceived Louis XIV. in certain negotiations for the surrender of Casale (q. v.), was secretly arrested, May 2, 1679, and conveyed to Pignerol, an account of the transaction being given in a pamphlet, *La Prudenza Triomfante di Casale* (Köln, 1682). Suggested by the Baron d'Heiss in the *Journal Encyclopédique* for 1770, this theory was adopted in the *Correspondance Interceptée* (1789) of the Chevalier de S——, who confounds, however, Matthioli with another agent of the Duke, the Count Girolamo Magni; and during the present century it has been supported by Roux-Fazillac, *Recherches sur l'Homme au Masque de Fer* (1800), Delort, *Histoire de l'Homme*, &c. (1825), and M. Marius Topin, *L'Homme*, &c. (1869, Eng. trans. 1870). This latest advocate of the Matthioli system maintains that Matthioli did not die, as has been supposed, in the January of 1687, but remained at Pignerol till March 19, 1694, when he was transferred to the Ile Ste. Marguerite; and a comparison of dates and of the documents first published in M. Topin's work would seem at first sight to go far to establish a theory, the grand objection to which—very cursorily dismissed by M. Topin—is that at Pignerol, at least, Matthioli certainly did not wear a mask, nor was he isolated from the other prisoners. So far, however, from being definitely settled, the whole question is reopened in M. Jung's *La Verité sur le Masque de Fer* (Par. 1873), which assumes the prisoner to have been the head of a plot for the assassination of Louis XIV.—possibly a Chevalier de Kiffenbach—and advances a mass of fresh unpublished documents in confirmation of that theory. But though, as less is known of this Kiffenbach, so it is harder to prove that he could not have been the man, yet the question, Whose was the face behind the I. M.? cannot be pronounced conclusively determined, and indeed is one that to all appearance will never receive a wholly satisfactory solution.

Irons. See Bilboes.

Iron'wood, a name variously applied in many different countries to the hardest and heaviest wood of that country. In botanical nomenclature the Greek equivalent, *Lideroxylon*, is a widely-distributed genus of *Sapotaceæ*.

I'rony (Gr. *eirōneia*, 'dissimulation'), a figure of rhetoric in which words by some peculiar form or tone of expression are made to convey a meaning precisely the reverse of their literal sense. Ex. 'No doubt but ye are the people, and wisdom will die with you' (Job xii. 2). 'The story of the astronomical observations, extending over 31,000 years, sent from Babylon to Aristotle, would be a conclusive proof of the antiquity of the Chaldæan astronomy, if it were true' (Sir G. Cornwall Lewis).

Iro'quois See Indians, American.

Irra'tional is a term applied to numerical quantities, which cannot be expressed by a finite number of figures. Thus $\sqrt{2}$, or the diagonal of the unit square, is an I. quantity. So also is the circumference of the circle of unit radius, a quantity usually symbolised by the Greek letter π.

Irrawadd'y (Irawad'i), the 'great river' of Burmah, which flows nearly due S. from the E. limit of the Himalayas into the Bay of Bengal: total length, about 1060 miles; drainage basin, about 150,800 sq. miles. It receives no important tributaries. On its banks are Bhamo, 640 miles from the sea, up to which point it is navigable even for steamers; Mandalay, the present capital of Independent Burmah, and Rangoon, the capital of British Burmah. Its delta lies between the Rangoon and Bassein rivers, which are both navigated by ships of the largest tonnage. Extensive embankments here protect the most productive rice-fields in the world. About 240 miles of the I. lie in British territory. In 1874-75 the I. flotilla had a fleet of nine steamers and nineteen flats; in addition to the steamers, 8203 laden boats passed up the river, and 8819 passed down. The king of Burmah has also steamers of his own. A State Railway is now in process of construction up the I. valley, on which, up to 1875, £82,000 had been expended. See Rangoon.

Irredu'cible Case, the name given to the case of a cubic equation, which cannot be solved by Cardan's Rule. See Cubic Equation.

Irriga'tion (Lat. *irrigatio*, 'watering'), signifies the watering of the soil to increase its productiveness. Rain, springs, and the flooding of rivers are natural irrigating agencies. Egypt owes its fertility to the annual inundation of the Nile, a phenomenon which is supposed to have first suggested the art of artificial I. to the Egyptians. In dry, arid countries, artificial I., which may be defined as the conservation and regulated distribution of the natural water supply, is absolutely essential to agriculture. China is the most efficiently irrigated country in the world, and in

India many vast works of I. have been carried out. Artificial I. is conducted mainly from canals, which draw their supplies from a river or perennial stream, across which a dam is thrown to raise the surface level and divert the water into the new channels. Minor canals branch off from the main canal, and these feed the distributaries that convey the water over the fields. Wells and tanks or reservoirs are also employed to supply the watercourses. The water may either trickle over the fields by gravitation, or be pumped up from a lower level by means of levers or wheels.

In India two great systems of I. prevail, which may be distinguished as (1) the I. of deltas; (2) the I. of Doabs (q. v.). The one system, chiefly adopted on the E. coast of Madras, is applicable to the large tracts of rich alluvial soil at the mouths of great rivers, and these are efficiently irrigated by main and branch canals supplied from the rivers, dams or *anicuts* being constructed just above the delta head. An additional feature of this system is the existence of vast storage tanks, the works of former native rulers. The province of Madras is said to possess 43,000 of these tanks, mostly formed by throwing embankments across hill gorges, which are transformed by rainfall and local drainage into artificial lakes. The Veranam tank has an embankment 12 miles long and an area of 35 sq. miles. The other system is practised in Northern India, and deals with the elevated country far inland, running along each side of the river-banks. The most important examples are to be found at the foot of the Himalayas, where the rivers Ganges, Jumna, and Sutlej first debouch upon the plain of Hindustan. Inundation canals fed by rivers in flood are abundant in the Punjaub and other regions. These canals water the crops of autumn, but do not benefit the crops of spring, because the rivers are then low; the canals are then cleared of the silt deposited during inundation. Apart from the initial difficulty of expense, I. in India is not unaccompanied with drawbacks of its own. It has been discovered, especially in parts of the N.W. Provinces, that excessive I. tends on the one hand to engender a malarious diathesis in the population, and, on the other, to produce a saline efflorescence, known as *reh*, which is fatal to the crops. I. is a great good; but the one real safeguard against periodical famines lies in the improvement of the local means of communication.

Many extensive permanent works of I. have been constructed in Europe, more particularly in Spain, Italy, and France. The old Moors were skilful irrigators, and the fruitfulness of the *huertas* of Valencia, Murcia, and other Spanish provinces is due in great measure to the splendid machinery laid down by them 600 years ago. In England I. has not hitherto received attention commensurate with its importance, and it is chiefly confined to water-meadows or grass-lands, whereas on the Continent all kinds of agricultural produce are systematically watered. The water-meadows of the Duke of Portland at Clipstone Park, Nottinghamshire, are noteworthy. The I. of water-meadows is conducted by laying out the ground, nearly level, in a series of parallel ridges and valleys, and a narrow channel is made along the top of each ridge for the passage of water from the main conduit. The water, overflowing, trickles down the sides of the ridges, and falling into the intervening gutters is carried by them to the drain. When the ground has a uniform slope, the 'catch-water' system is pursued, in which the main drain charged with all the surplus water from the upper part of the slope becomes in turn a distributing channel to a lower tract, and so on successively. Perfectly level ground may also be irrigated from underground drains. All water is not alike adapted for purposes of I. Spring or river water may be impregnated with matter noxious to plants, therefore it is of prime importance to determine its suitableness beforehand. Good drainage should, of course, exist in water-meadows, and after the water has run for two or three weeks it should be withdrawn for some days to give the soil time to dry and air.

The question of I. in relation to the disposal of liquid sewage is assuming an important aspect; and the study now devoted to it is earnest that steps will soon be taken to extend a plan that is already in successful operation in many towns in England, likewise at Edinburgh—where rude sewage I. has been followed for upwards of a century—and Paris, and which is shortly to be tried at Brussels and Berlin. See Moncrieff, *I. in Southern Europe* (1868); Roberts, *I. in Spain* (1867); *Madras I. Reports*; Baird Smith, *Italian I.* (1855); *I. in Madras Provinces* (1856); Aymard, *Irrigations du Midi de l'Espagne* (1864); Nadault de Buffon, *Des Canaux d'I. de l'Italie Septentrionale*; and the chapter on I. in *The Progress Report of India for 1872–73*.

Irritabil'ity of Plants. In plants, from the lowest algæ to the highest development of vegetable life, certain sensible movements and actions not referable to mere elasticity or to the hygroscopic nature of the tissues have been noticed, which are classed together under the head of vegetable irritability. The motive cause is often obscure, but the use in many cases is obvious, and the writings of Darwin and of certain other observers have raised the subject to one of intense interest to the biologist. Reference must be made to these special writings, it being impossible to give even an outline in a short encyclopædia article.

Irr'itancy (Lat. *irritus*, 'of no effect'), a term of Scotch law. The I. of a right is its forfeiture in consequence of neglect or contravention. It may take place by force of the law alone (*ex lege*), or in consequence of stipulation. By the former, is the I. of a feu from non-payment of the feu during two years. Legal I. is incurred by a lessee allowing his rent to fall into arrear for two years, or by the lessee deserting or neglecting to cultivate the farm at the usual time. *Irritant Clause* is a clause in a Scotch deed of entail by which certain acts by the holder under the deed are declared void.

Irrita'tion is the term applied to morbid or artificially produced excitement of the vital actions. I. may be produced artificially by the application of irritants, such as *acetic acid*, *sinapisms*, *ammonia*, *camphor*, *turpentine*, *cantharides*, *iodine*, *mercury*, and *tartrate of antimony*. The action of many medicinal substances is due to I. alone, such as certain active cathartics. The term I. is frequently applied to what is strictly due to reflex action artificially produced, or to the result of healthy or morbid conditions; thus I. of the fauces may excite vomiting or coughing; the gravid uterus or abdominal tumours may cause sickness and vomiting; calculi, vomiting and tenesmus; while I. from intestinal worms affects the nostrils.

Ir'tish, an affluent of the Obi (q. v.), in W. Siberia, rises in the Altai Mountains, flows through the Zaisan Lake, has a winding north-easterly course through the governments of Semipalatinsk and Tobolsk, and joins the Obi, near Troitsk, 200 miles N. of Tobolsk. It receives the Ishim and Tobol, and has a length of 2080 miles.

Ir'vine, a town of Scotland, in Ayrshire, on a river of the same name, about a mile from its mouth on the Firth of Clyde, and 23 miles S.W. of Glasgow, with which it is connected by railway. It has two fine churches, and near the harbour there are three extensive chemical works, two of which cover 20 acres, and employ 300 men each. The manufactures are chiefly soda ash, bleaching powder, copper extracted by the wet process (the small quantities of gold and silver in the ores being recovered), and bichromate of potash. The wharf of the harbour was extended in 1873. Gravitation water is (1877) being brought into I., from a distance of 6 miles, at a cost of £30,000. The river is crossed by a handsome stone bridge of four arches. The academy of I. is a higher class school. Pop. (1870) 4299; including Fullarton on the opposite bank of the river, 6866. With Ayr, Campbeltown, Oban, and Inverary, I. sends one member to Parliament. I. is an old royal burgh, and was the site of a convent of White Friars, founded by the Fullartons in the 14th c. It is the birthplace of the poet Montgomery and of the novelist Galt.

Ir'ving, Edward, a great Scottish preacher, was born at Annan, Dumfriesshire, in 1792, studied at Edinburgh University, where he was a distinguished student, especially in mathematics; taught about a year in Haddington, and about seven in Kirkcaldy, latterly attending also the Divinity Hall in Edinburgh. In 1819 he was licensed a preacher of the Church of Scotland by the Presbytery of Annan. When on the point of setting out as a missionary to Persia he was appointed assistant to Dr. Chalmers in Glasgow, and for two years, says the biographer of the latter, 'Dr. Chalmers was refreshed and sustained by the congenial fellowship and efficient co-operation of a like-minded and noble associate.' In 1822 he was called to London to be pastor of the Caledonian Chapel there, and for two years enjoyed unprecedented popularity. An exalted, antique eloquence, full of an elaborate grace and pomp, that rivalled the

best literature of the old English divines, marked his discourses, and compelled for a time the homage of the London 'world.' The tendency to mysticism, which he had always shown, grew upon him, however, and found scope in the exposition of unfulfilled prophecy. He then adopted the opinion that want of faith alone prevented the miraculous gifts possessed by the primitive Church from being enjoyed yet. Arraigned by the Presbytery of London in 1830 for heresy regarding the person of Christ, of whom he maintained that 'our Lord took upon him fallen and sinful flesh, with like appetites and desires as are found in us,' he was deposed by the Presbytery of Annan in 1833, and died in Glasgow next year, in the forty-third year of his age. His friend Carlyle says of I., 'his head, when the fog-Babylon had not obscured it, was of strong, far-reaching insight,' and 'his was the freest, bravest, brotherliest human soul mine ever came in contact with.' See Carlyle's *Miscellaneous Essays*, and Mrs. Oliphant's *Life of E. I.* (Lond. 1862).

Irving, John Henry Brodribb, a modern actor, was born February 6, 1838, and made his first appearance on the stage at Sunderland, September 29, 1856. He received a ten years' theatrical training in provincial theatres, playing successively in Edinburgh, Glasgow, Manchester, and Liverpool. His first London engagement was as Doricourt in the *Belle's Stratagem*, at the Lyceum Theatre. In the popular comedy of the *Two Roses* he played Digby Grand for three hundred nights at the Vaudeville. On November 20, 1871, he appeared at the Lyceum as Mathias in *The Bells*, a performance which caused a great sensation. At the last-named theatre he still (1877) remains, having appeared there as Charles I., Richelieu, Eugene Aram, Hamlet, Macbeth, Othello, and Richard III., with great approbation. His first provincial tour in 1876 was an almost unprecedented triumph. In his Shakespearian impersonations he has shown a tendency to break through stage tradition, and may be regarded as the leader of the Realistic school. Critics differ as to the merits of these performances, but all agree that he is an actor of striking force and singular originality. In melodrama he has no living rival.

Irving, Washington, an illustrious American author, the son of a Scotch merchant in New York, was born in that city, April 3, 1783. He left the study of law in 1803 to travel for his health in Europe, returning in 1806. His first work of any note was the burlesque *History of New York*, by Diedrich Knickerbocker (1809), which was widely read, its dainty satire and happy humour exciting the warm admiration of Walter Scott. He became a partner in the commercial house of Irving Brothers, and in 1815 went as its Liverpool representative to England, where he was cordially received in literary circles. Literature had till now been only a pastime to him, but in 1817 his house failed, and his pen became his only capital. Scott (whose hospitality he afterwards commemorated in *Recollections of Abbotsford*) generously interested himself on I.'s behalf, and induced Murray to publish the *Sketch-Book* in 1820. This was followed by *Bracebridge Hall* (1822) and *Tales of a Traveller* (1824). Their success was great and deserved. His polished style, bright fancy, and delicate wit, wrung from the English public an acknowledgment that a classic author had at length risen in America, who, not unworthily, wore the mantle of Addison. Taking up his residence in Spain, I. struck a new mine of literary wealth. *The Life and Voyages of Christopher Columbus* (1828), *The Conquest of Granada* (1829), and *The Alhambra* (1832), displayed his fine powers as a historian, and procured for him, along with Hallam, a medal from George IV. for historical eminence. He returned to America in 1832, and, with the exception of a residence as Minister at Madrid, 1842-45, remained there till his death. His chief works during this time were the *Tour on the Prairies* (1835), *Adventures of Captain Bonneville* (1837), *Life of Goldsmith* (1846), *Mahomet and his Successors* (1849), *Chronicles of Wolfcote Roost* (1855), and the *Life of Washington*, his crowning effort (1855-59). During his life 600,000 copies of his works were sold in America, and they had also a vast popularity in this country. His private character was high and pure. He died at his residence, Sunnyside, an old Dutch mansion on the Hudson, in the 'Sleepy Hollow' of his story, November 28, 1859. See Pierre Irving's *Life and Letters of W. I.* (4 vols. Lond. 1862-64).

Ir'vingites are a small sect of Christians founded by the Rev. E. Irving (q. v.). This name, however, they disclaim, as following no earthly leader, and assume that of the Apostolic Catholic Church. When Irving was deposed in 1833 his followers took another place of worship. On his death in 1834 a pastor was appointed in his place, and other six congregations were formed in London. Besides about thirty congregations in England, there are now congregations in Scotland, Ireland, the Continent, and America, but with small numbers. The only standards of faith which they recognise are the Apostles', Nicene, and Athanasian creeds. Their most peculiar tenet is that Apostles (of whom there ought to be twelve), Prophets, Evangelists, and Pastors are the ministers of the Church for all time, designed, along with the power and gift of the Holy Spirit, to prepare Christ's followers for his second coming. Another peculiarity of the Apostolic Catholic Church is the extraordinary use made in it of material symbols—*e.g.*, oil, light, incense, vestments, &c.—as exponents of spiritual realities. They hold that these belong to the gospel dispensation as much as the use of water in baptism, and of bread and wine in the Eucharist. The congregations are under the charge of angels or bishops, priests, and deacons; the ministry being supported by the tithes of the income of the members and freewill offerings. The hours of worship in fully-equipped churches are very frequent—at six, morning and evening, at nine, and at three. The Eucharist, which is regarded as a real sacrifice of the body of Christ, is celebrated every Sunday, and frequently in the course of the week. From holding the doctrine of the real presence of Christ, consecrated elements are kept on the altar at the time of ordinary worship. See Baxter's *Irvingism, its Rise*, &c. (1836).

I'saac (Heb. 'laughter'), the Hebrew patriarch, was son of Abraham (q. v.) and Sarah. When forty years old he married his cousin Rebecca (Gen. xxiv., *cf.* xxv. 20), by whom he had two sons, Esau (q. v.) and Jacob (q. v.). He died at Hebron at the age of 180, and was buried by his two sons in the cave of Machpelah (Gen. xxxv. 28, 29).

Isaac I., Eastern Roman Emperor, who succeeded the deposed Michael VI., founded the Comnenian dynasty (see BYZANTINE EMPIRE) in 1056. He had previously been employed in important civil and military services by Basil II. I.'s reign was marked by two principal events—the internal economical struggle which he carried on against the clergy in order to force contributions from them to the taxation of the country, and (1059) the warfare with the Hungarians, whom he was successful in keeping at bay. I. ceded his crown in the same year to Constantine Ducas, under the impression that he was a dying man. In 1061 he died in a convent to which he had retired, leaving behind him a reputation for moral strength, political capacity, and literary power. His erudition is embalmed in some Homeric Scholia, in a work upon the Greek and Trojan chiefs, and in a volume *On the Works of Homer*.

Isabell'a of Castile, daughter of Juan II., born at Madrigal, 22d April 1451, married Ferdinand of Aragon, 19th October 1469, and succeeded her half-brother Enrique IV. on the thrones of Castile and Leon, 13th December 1474. Her husband becoming King of Aragon ten years later under the title Ferdinand V., the royal consorts assumed the titles King and Queen of Spain. The great events of their united reigns have been already noticed under FERDINAND, but it is to the genius of Isabella, who jealously maintained her independent sovereignty, that many of them are rightly assignable. Thus she spurred her husband to the conquest of Granada from the Moors (1481), and herself shared in the trials and dangers of the campaign; hers is the glory of having fitted out at her own expense the first expedition of Columbus (1492); but on her must rest the blot of having in 1478 procured a bull from Sixtus IV. for the introduction of the Holy Office into Castile, and of having caused the expulsion of the Jews from that country. Isabella died at Medina del Campo, November 26, 1504. She had five children, of whom one, Juana, was mother of Karl V., and another the unfortunate Catharine of Aragon. See Prescott's *History of Ferdinand and Isabella* (1838).—**I. II.**, ex-Queen of Spain, born at Madrid, October 10, 1830, succeeded her father, Ferdinand VII., September 29, 1833, under the regency of her mother, Maria-Christina. The latter resigned in 1840 in favour of Espartero, and on October 15, 1843, I. was declared by the Cortes to have attained her majority, and three years later married her cousin, Don Francisco de Assisi. Five

children were the fruit of this marriage, which, solely dictated by policy, proved an unhappy one. I.'s reign of thirty-five years witnessed the downfall of 40 ministries and 500 ministers, and was in fact but a series of alternate triumphs and defeats on the part of Narvaez, Espartero, and O'Donnell. Her court was the most profligate in Europe, and even the Golden Rose, sent her by Pio Nono in 1868, failed to rehabilitate her private character. Still, good-natured and liberal, I. was popular with the mass of the Spanish people, and this popularity was heightened by an attempt upon her life in 1852 by a priest, Martin Marino. Prim's first attempt at revolt, in 1866, was a failure; his second, in 1868, forced I. to quit her throne, and, with a favourite, Marfori, take refuge in France. On June 15, 1870, she abdicated in favour of her son, Alfonso XII. (q. v.), at Paris, where, with the exception of a visit to Geneva during the Franco-Prussian war, she resided till 1876, when she returned to Spain.

Isabella the Catholic, American Order of, a Spanish order of knighthood, founded by Ferdinand VII., March 24, 1815, was originally designed for the defenders of the Spanish possessions in America, but is now bestowed for merit generally. The king is its head, and there are three classes—Grand Crosses, Commanders, and Knights.

Isa'iah (Heb. 'Jehovah's salvation') the greatest prophet of the kingdom of Judah, was the son of Amos, who is otherwise unknown. The age to which he belonged was the reigns of Uzziah (who died B.C. 759), Jotham, Ahaz, and Hezekiah (B.C. 728–699). He was thus the contemporary of Micah and (probably) Joel in Judah, and of Hosea and Amos in Israel. The latest period for which we have certain information of the prophet's ministry is about the fourteenth year of the reign of Hezekiah (B.C. 714; 2 Kings xx.; Isa. xxxviii. 39), that is, forty-six years after the death of Uzziah, at which time he was probably ordained to the prophetic office (Isa. vi. 1–9). But there is some reason to believe that he continued his work till the reign of Manasseh. He wrote a history both of Uzziah and Hezekiah (2 Chron. xxvi. 22, xxxii. 32), both being presumably written after the king's death. There is also an ancient tradition, whatever value may be attached to it, according to which he suffered martyrdom under Manasseh by being sawn asunder. The book of the prophecies of I. naturally divides itself into three parts: chapters i.–xxxv., xxxvi.–xxxix., and xl.–lxvi. Till the end of last century the whole book was by universal consent (with one exception) attributed to one and the same author. That exception was Aben Esra, who as early as the 12th c. had maintained the opinion that the author of the last part was a prophet of the time of the Babylonish exile. This is the part which modern critics are most confident cannot be from the hand of I.; but there are passages even in the first part, *e.g.*, ii. 2-4, xiii. 1, xiv. 23, xxi. 1–10, xxxiv., xxxv., which some attribute to other prophets and times. On the other hand, there are not wanting able and learned critics who controvert all this, and vindicate the integrity of the book, and the unity of the authorship in all its divisions. The literature of I. is perhaps the very noblest in the whole range of the Old Testament. Never did sublime hopes clothe themselves in more brilliant imaginative forms. The spiritual exaltation is at times so intense, the future of the prophetic vision so full of thrilling joy and heavenly beauty, that one shrinks from seeking their origin in the mere patriotic yearnings of an impassioned exile. Nothing in history is worthy of them but the character and work of Christ, and hence the Church in all ages has been wont to speak of I. as, *par excellence*, the evangelical or Messianic prophet. See Ewald's *Propheten des Alten Bundes*.

I'sar, a tributary of the Danube, in Bavaria, rises in a lava ridge in Tyrol, rushes impetuously through the Porta Claudia in the Chalk Alps, flows N. and N.E. through the Dachauer and Erdinger morasses, passes Munich and Landshut, receives the Amper, and joins the Danube at Deggendorf, after a course of 216 miles. Much timber is floated down the I. from the mountains.

Is'atin ($C_{16}H_{10}N_2O_2$), the body produced by boiling indigo with nitric acid till the blue colour disappears through oxidation. Brilliant red prismatic crystals form when the hot solution cools. It is soluble both in alcohol and in water, and turns violet on addition of an alkali.

Is'chia (Gr. *Pithecusa*; Class. Lat. *Ænaria* or *Inarime*; Med. Lat. *Iscala*), a beautiful island at the entrance to the Gulf of Naples, and 5 miles from the mainland, with an area of 25 sq. miles, and a pop. (1874) of 24,000. It is rocky and of volcanic origin, rising in Monte Epomeo (anc. *Epopos*) to a height of 2574. It is widely celebrated for its charming climate, its delicious wines and fruits, its mineral springs, and valuable potter's clay. I., the capital, has a castle, and a pop. of 2930. The island is often visited by severe earthquakes, but the most recent irruption of Epomeo was in 1302. The celebrated general Marchese Pescara was born in 1489 at the castle of I., which later was defended gallantly by his sister Constance against the forces of Louis XII. of France. Her family was rewarded with the government of I., which they retained till 1734. The town of I. (pop. 6546) is the seat of a bishop, and has a lofty insulated fort connected with the land by a pier. Other towns are Casamicciola and Forio.

Is'chium is the name given to a portion of the innominate or pelvic bone. It forms the posterior and lower portion of this bone (in man), and in the sitting posture the body rests chiefly on the two ischia.

Ischl, a very popular bathing-place, and the seat of an imperial residence, in the heart of the 'Salzkammergut' district in Upper Austria, beautifully situated 1520 feet above the sea and 50 miles S.S.W. of Linz, in a magnificent valley on the river Traun, a small affluent of the Danube. The climate is very mild and equal, and of great benefit to consumptive patients. Its saltworks produce about 200,000 tons of salt yearly, and the salt-baths are highly esteemed. Pop. 6215.

Ise'o, Lago d' (the *Sebinus Lacus* of Pliny), a lake of Northern Italy, dividing the provinces of Brescia and Bergamo, and inferior for magnitude and beauty only to the three great lakes. It is 620 feet above sea-level, about 18 miles long from N. to S. by 2–3 broad, and 1000 feet deep, and is fed by the Oglio (*Ollius*) and Borlazzo. Steamboats ply upon it from Sarnico at the S. extremity to Iseo, an ancient town at its head, with (1871) 1784 inhabitants. In the L. d'I. rises the rocky island of Monte d'Isola, 1½ miles long, and containing two fishing villages.

Isère', a S.E. department of France, bounded N. and W. by the Rhone, S. by Ardèche and Drome, and E. by Savoie. Area, 3200 sq. miles; pop. (1872) 575,784. To the N. of the river I., which bisects the department in a S.W. direction, stretch fertile plains, but S. of it is a romantic highland, abounding in pine-woods, glaciers, and mountains, the loftiest of which is L'Aiguille-de-Meije (12,308 feet). In spite of a variable climate, agriculture is highly developed in I., and its vineyards yield some 10,000,000 gallons of excellent white and red wines annually. Iron-mining, silkworm-rearing, and glove-making are also important industries. I. is traversed by the Paris-à-Lyon Railway, with six branch lines. The chief towns are Grenoble (the capital), Voiron, and Vienne.

The *river* I. rises at a height of about 7000 feet in the Col d'Iseran in Savoie, winds in a general south-westerly direction through that department, and those of I. and Drôme, and falls into the Rhone at Coufoulin, 8 miles N. of Valence. Its chief tributaries are the Arc, Bréda, and Drac.

Iserlohn', a town in the province of Westphalia, Prussia, on the Baar, 14 miles S.E. of Dortmund, stands picturesquely in a hilly district, and is an important trade centre, its manufactures, which date from the 18th c., being chiefly of ironware, needles, and wire. I. itself has seventeen large manufactories, and the whole neighbourhood abounds in foundries, paper-mills, &c. Pop. (1875) 16,868.

Iser'nia (the *Æsernia* of the Samnites), a town of Italy, in the province of Campobasso, stands on an isolated eminence 29 miles N.E. of Caianello. It is now a dirty and confined place, consisting of one long street, but in the time of Trajan was a municipal town of some importance, as is attested by a Roman aqueduct and the remains of a fine bridge. The walls still present fragments of ancient polygonal work, believed to be of Samnite origin. Pop. (1871) 7715.

Ish'mael (Heb. 'God hears'), the eldest son of Abraham, by his Egyptian concubine Hagar, was born at Mamre, fourteen years before the birth of Isaac (Gen. xvi. 3–16, *cf.* xxi. 5). He married an Egyptian wife (xxi. 21), and was the progenitor of the tribes in the N. and W. of the Arabian peninsula (xxv. 12–18).

According to some modern critics, the object of the story is to give an account of the Ishmaelites, or wandering Arab tribes, in relation to the Hebrews. Thus the Ishmaelites were related to them, but not their equals. I. was older than Isaac, but his mother was an Egyptian; or, the Ishmaelites had been an independent people before the Israelites, but had not preserved the purity of their blood.

Is'idore of Seville, born at Carthagena about A.D. 570, became Bishop of Seville about 600. He presided at the second Council of Seville (619), and at that of Toledo (633), and died 636. From the variety and extent of his knowledge, as exhibited in his numerous writings, I. must be regarded not only as an influential ecclesiastic, but as one of the most learned men of his time. The complete works of I., which included doctrinal, exegetical, canonical, and historical writings, and the most important of which was *Originum sive Etymologiarum Libri* xx., an encyclopædia of arts and science, treating of all the subjects in literature, science, and religion studied at the time, were published in 7 vols. 4to by Arevali at Rome (1797–1803).

Isidor'ian Decre'tals professed to be a collection made by Isidore of Seville (q. v.) of Decretal Epistles of the bishops of Rome from Clement I. to Damasus I. (384). The collection contains genuine decretals and canons, but most of them are deliberate forgeries. The real author and the exact time and place of publication are unknown. Coming to light about 830–845, they were eagerly taken up by the Popes as favouring their pretensions to absolute supremacy over the Church, were appealed to in public transactions, and were circulated in various collections without suspicion till the Reformation. The 'Donatio Constantini M.' a fiction of an earlier time, conferring on the Bishop of Rome the sovereignty of the city of Rome, of Italy, and of the Western Provinces, was adopted into them, and formed the first stepping-stone on which the Pope tried to raise himself even above the state. The authenticity of the I. D. was first seriously attacked in the Magdeburg Centuriators (q. v.). Against this attack they were defended by the Jesuit Turrianus, but the forgery was incontrovertibly exposed by Blondell in his *Pseudo-Isidorus et Turrianus Vapulantes* (Geneva, 1628). Even Roman Catholic writers now admit the forgery, contending only that they were not the cause, but merely the expression, of the ecclesiastical development which was in progress at the time. See Gieseler's *Lehrbuch Kirchengeschichte* (Bonn, 1855; Eng. trans. by Davidson).

I'singlass. See GELATINE.

I'sis (the Græcised form of *Hes*), an Egyptian goddess, daughter of Seb and Nut, sister and wife of Osiris, and mother of Horus, is represented by a throne in the hieroglyphics, where she is styled 'queen of heaven' and 'mother-goddess.' Regarded by the Egyptians as both a celestial and terrestrial divinity, I. was identified by the Greeks with Demeter, by the Romans with Ceres, and by Tacitus (*Germ.* 9) with the German Hertha. The earliest seat of her cultus was at This, in Upper Egypt, and other shrines peculiarly sacred to her were at Philæ, Dendera, Memphis, and Busiris. Her worship became general in Egypt under the eighteenth dynasty, spread thence to Greece and Asia Minor early in the 3d c. B.C., and was introduced into Rome in the time of Sulla. There the licentiousness of her mysteries led to numerous enactments against their celebration from B.C. 58 down to the time of Vespasian, when along with Serapis she was formally admitted into the Roman pantheon, and a temple erected in her honour in the Campus Martius. In works of art I. is usually clad in a long tunic gathered on the breast in a knot; her head is sometimes horned, sometimes crowned with a lotus-blossom; and in her right hand she bears the sistrum. Her son Horus frequently stands by her side. See Bunsen, *Egyptens Stelle in der Weltgeschichte*; Sir G. Wilkinson, *Manners and Customs of the Ancient Egyptians*; and Birch, *Gall. Ant.*

Isis. See THAMES.

Iskanderun', or **Alexandrett'a**, a town of Asiatic Turkey, in the vilayet of Aleppo, on the E. side of the Gulf of I. (*Sinus Issicus*), and 78 miles N.W. of Aleppo, of which it is the port, is a decayed place, surrounded by malarious marshes. In 1874, 439 vessels of 175,138 tons entered and cleared the port, and the total value of imports and exports amounted to £2,207,976. Pop. about 1000. I. was the ancient *Alexandria ad Issum*, founded by Alexander the Great to commemorate the battle of Issus (q. v.), B.C. 333; and a place in the neighbourhood named Jacob's Well has been identified with the *Myriandrus* of Xenophon. Tancred took I. in 1097; and it was the scene of a defeat of the Turks by the Egyptians, April 13, 1832.

Is'la de Pi'nos, a West Indian island, lying 30 miles S. of Cuba, to which it belongs. Area, 800 sq. miles; estimated pop. 2000. The surface is mountainous, the Sierra de la Canada attaining a height of 1600 feet; the climate healthy and the soil extremely fertile. Iron, silver, and mahogany are the chief products of the island, the capital of which is Nueva Gerona. I. de P. was discovered by Columbus in 1494, and was long a rendezvous for pirates and bucaneers.

Islam', or **Eslam'**, the name by which the followers of Mohammed call their faith, means self-devotion to God. He who professes I. is a *Moslem*, a word common in the corrupt form *Mussulman*.

Isl'and, in Old Eng. *ealand* or *igland*, *i.e.*, 'land in water,' or 'waterland.' The word is properly spelled *iland* (*e.g.*, 'and come vnto an *iland* waste and voyd,' *Færie Queene*, book xi. c. 6), the *s* in the modern spelling being due to a fanciful connection with the Fr. *isle*, derived from Lat. *insula*. In geography an I. means a piece of land surrounded by water. A large group of islands is called an Archipelago (q. v). Next to Australia, which is sometimes regarded as a continent, the largest I. in the world is Borneo. Most of the groups near continents, which themselves are merely islands on a much larger scale, have been connected with the mainland at one time. Oceanic or pelagic islands are usually either volcanic or coralline. See CORAL ISLANDS.

Islands of the Blessed (Gr. *hai tōn makarōn nēsoi*; Lat. *Fortunatæ Insulæ*), in Greek mythology, were placed far beyond the Pillars of Hercules on the western verge of Oceanus, and were identified by Hesiod and Pindar with Elysium (q. v.). In later times the name was transferred to the Canary, Madeira, and Azores groups, which first became known to the Romans at the close of the civil wars of Marius and Sulla; but the existence of the ancient myth suggests that these islands may have been accidently discovered by earlier Phœnician or even Etruscan navigators.

Isl'ay, one of the largest islands of the inner Hebrides, included in Argyleshire, Scotland, lies 1 mile S.W. of Jura, and 15 miles W. of the promontory of Kintyre. Area, 220 sq. miles; pop. (1870) 8143. It is perhaps the most populous and productive of the Hebrides, is 25 miles long and 22 broad, and the surface is hilly in the E. and N. The highest points are Ben Varn, 1500 feet; and Ben Ronastel, 1050 feet. The great bight of Loch-indaal converts the western portion into a large peninsula. About a third of the surface is under corn and green crops, and lead, copper, manganese, and marble are obtained in considerable quantity. There is abundance of deer and wildfowl, and a productive salmon-fishery. The chief villages are Port Ellen, with a pop. of about 1000, and the fishing station of Ascaig. Eight distilleries in the island yield annually 400,000 gallons of whisky. The exports include large numbers of black cattle and sheep. I. was a favourite residence of the Lords of the Isles, and passed to their rivals the Campbells about 1616.

Isle of Man. See MAN, ISLE OF.

Isles, Lord of the, a title borne by the descendants of Somerled (or Samuel, Gael. Somhairle), thane of Argyle, who in 1135, on the expulsion of the Norwegians from Arran and Bute by David I., seems to have received a grant of these and other islands from that monarch. On Somerled's assassination in 1164, his dominions were divided between his three sons, Dugal, Angus, and Reginald—Mull, Coll, Tiree, and Jura falling to the eldest; Islay, Kintyre, and half Arran to the second; Bute and the remaining half of Arran to the third. The last subsequently added Dugal's inheritance to his own, and in his line was vested the Lordship of the Isles. Angus Oig, great-grandson to Reginald, fought under Bruce at Bannockburn (1314), and is the hero of Scott's *L. of the I.*, and Angus's grandson Donald was defeated at Harlaw (q. v.) in 1411 by the Earl of Mar, and forced to surrender the Earldom of Ross, which he had seized in his wife's right. With the death of John, son of Donald, in 1498, the direct line terminated, and though various

bastard members of the house assumed the title, their claims were never recognised. The Lordship of the Isles was annexed to the Scottish crown December 3, 1540, and from it the Prince of Wales now derives one of his titles.

Is'lington, a suburb of London, in the parliamentary borough of Finsbury, forming the greater part of the Northern postal district, and embracing Highbury, Holloway, Barnsbury, Kingsland, &c. A country village in the beginning of the century, it had in 1871 a pop. of 213,778. Being only 2 miles from the bank, it is greatly inhabited by City men. It abounds in churches and charitable institutions. The Agricultural Hall is the largest building of the kind in London.

Is'maelites (*Ismaili*), a branch of the Mohammedan sect of the Shiites, or upholders of the claims of Ali (q. v.) to the califate, derived their name from Ismail (*circa* 722 A.D.), the seventh Imaum in descent from Ali. They seem to have existed under the early Abbasides, but were first organised in the 10th c. by Abdallah Ibn Maimun, a Persian, to whose influence may be ascribed the singular compound of Islamism and Zoroastrianism observable in the tenets of the I. This Abdallah preached the advent of a Messiah who should be greater than Mohammed, and by his esoteric interpretation of the Koran laid himself and his followers open to charges of atheism and immorality. The I. in their turn gave birth in the 11th c. to the Assassins (q. v.); and by the remnants of that sect, after its suppression in 1272, Ismaelite doctrines have been handed down to our own time. At present there are the Syrian I. of Massyad, and the Persian I. of Rudbar in Khorassan.

Ismail', formerly **Tutch'ikov**, a fortified river-port of Moldavia, on the Kilia, an arm of the Danube, 40 miles from its entrance into the Black Sea. It was destroyed by Suwaroff in 1789, but was rebuilt, and is now a thriving city. In 1872 it exported 167,478 quarters of wheat, 37,867 of maize, 14,363 of barley, 11,267 of rye, and 5068 cwts. of wool. Steamers ply regularly between I. and Braïla. Pop. 26,000. I. was ceded to Russia at the peace of Bucharest in 1812, and became the station of the Russian fleet of the Danube. It reverted to Turkey by the treaty of Paris in 1856, and is now part of Rumania.

Ismail Pasha, Khedive of Egypt, second son of Ibrahim Pasha, was born in 1830, and educated at Paris. He became general-in-chief of the Egyptian army in 1862, and succeeded his uncle, Said Pasha, as fifth viceroy in 1863, securing in 1866, by enormous presents to the Porte, a direct line of succession for his house. In the same year he sent 30,000 troops to subdue the insurrection in Crete. In 1867 he received the title of Khedive. His assumption of sovereignty, and the regal style in which he entertained several crowned heads and 10,000 guests at the opening of the Suez Canal in 1869, excited the jealousy of the Sultan, and he was ordered to reduce his naval and military establishments. By a firman in 1873, however, he obtained complete control over his army, and several important concessions. Meanwhile, ostensibly to suppress the slave trade, he had sent various expeditions far southwards along the basin of the Nile, which greatly extended his sway. He employed many foreigners in the embellishment of his capital, and spent excessive sums for civil and warlike purposes. Notwithstanding the huge capital raised by him by loans in 1868 and 1873, his finances were in 1876 in so unsatisfactory a condition that he was compelled to sell his Suez Canal shares to the British Government, who sent Mr. Cave, as special commissioner, to investigate his accounts. Neither this mission nor that of Mr. Goschen and Monsieur Joubert later, in the interests of the British and French bondholders, have as yet (1877) restored his credit in any great degree. In the war of the Turks with Servia in 1876, and with Russia in 1877, he rendered the Porte active military assistance.

Ismail'ia, a town of Lower Egypt, situated on the Suez Canal, and on the N. shore of Lake Timsah, 147 miles. E.S.E. of Alexandria by railway. It was founded in 1863, as the headquarters for the general direction of the canal works, and is named after the Khedive, Ismail Pasha (q. v.). It lies at the E. end of the Suez Company's freshwater canal, which was opened April 9, 1877, and is intended, since the choking of the Canopus branch of the Nile, as a more direct channel to the ocean highway for the grain, cotton-seed, and sugar of Upper Egypt. Lake Timsah is spacious enough to receive a fleet of merchantmen, but as yet the warehouses and cotton-presses are at Alexandria. Passengers from Cairo and Alexandria to Suez can only be conveyed *via* Zagazig and I. since the abandonment of the old desert line in 1874. Pop. 4000.

I'sobaric or **Isobaromet'ric Lines** are lines drawn through those localities for which the mean annual barometric pressure is the same. They are constructed upon the same principle and have the same properties as Isotherms (q. v.) and contour lines. See GRAPHICAL REPRESENTATION.

Isocar'dia, a genus of *Lamellibranchiate* Molluscs, belonging to the family *Cyprinidæ*, and familarly known as 'heart-cockles' from the form of the shells, the beaks of which are widely separate, and of sub-spiral arrangement. *I. cor* is a familiar species. These shells are first found as fossils in the Triassic rocks, and are very abundant in the Oolitic formations and in the Chalk system.

Isoc'hronism. See CYCLOID and PENDULUM.

Isoclin'ic and **Isogon'ic Lines** are lines of equal magnetic inclination and declination respectively. See MAGNETISM.

Isoc'rates, a famous Athenian orator, who from bodily weakness and timidity did not appear as a political speaker, but devoted himself to teaching eloquence, and preparing written orations. He became rich by his instructions, being said to have had about 100 disciples, who paid him 1000 drachmæ each. After the rule of the thirty tyrants, he busied himself with preparing legal harangues for others. Going to Chios in 392 B.C., he entered a new path, publishing so-called epideictic orations, and continued this practice, together with his teaching, after his return to Athens in 388. Born in 436, eight years after Xenophon and Aristophanes, and eight years before Plato, he died in 338, two years before the accession of Alexander the Great. The tradition, given by Pausanias and Lucian, that grief for the defeat at Chæronea was the cause of his death, though accepted in Milton's allusion to the 'Dishonest victory, fatal to liberty, which killed with report that old man eloquent,' has been proved by Blass to be untrue. Twenty-one of his speeches are preserved, the *Codex Urbinas*, probably the most perfect of all Greek MSS., containing nineteen. In the purest Attic dialect, and in a clear but highly artificial style, they treat subjects of social and political importance, and are written to be read, not spoken. The best known is the *Panegyrikos*, a sort of festival-speech, recounting the services of Athens to Hellas, and justifying her hegemony. The *Editio Princeps* of I. is by Demetrius Chalcondylas (Milan, 1493), and the first Aldine edition is dated 1513. The edition of Jerome Wolf (1548, 1551, 1570), containing the first modern *Commentary* on I., and that of Koraes (Paris, 1807-8), are the best for exegesis, those of Baiter and Sauppe (Zürich, 1839) and Benseler (Leips. 1851, 1856) being the best for textual criticism.

Isom'erism. This term is applied to a phenomenon especially observable in the chemistry of carbon compounds. It frequently occurs that bodies differing in properties and functions are found on ultimate analysis to contain their elements, carbon and hydrogen, with oxygen and nitrogen, as the case may be, in the same proportion; in other words, have the same percentage composition. Such bodies are called *isomeric*, or of equal parts (*isomeres*). On closer investigation, however, differences appear which have led to the subdivision of isomeric bodies into various classes. In certain cases, while the percentage composition is the same, the molecular magnitude as determined by the vapour density is different. Thus ethylene and butylene contain the same proportions of carbon and hydrogen, but the vapour density of butylene being double that of ethylene, the formula assigned to it is C_4H_8, while that of ethylene is C_2H_4. The same is the case with propylene, C_3H_6, and hexylene, C_6H_{12}. Similarly the formula of acetic acid is $C_2H_4O_2$, of lactic acid $C_3H_6O_3$, of grape-sugar $C_6H_{12}O_6$, each being a whole multiple of the formula CH_2O, which expresses in the simplest form the ratio in which the elements exist in these compounds. Other examples are afforded by acetylene, C_2H_2, and benzol, C_6H_6; cyanic acid, CHNO, fulminic acid, $C_2H_2N_2O_2$ (which, however, is only known in the form of fulminates), and cyanuric acid, $C_3H_3N_3O_3$. Compounds which, like those just quoted, are multiples of some simple formula, are said to be polymeric; and

when a body in the course of a chemical action appears to be changed into another with a multiple of the original formula, as when pyridine (C_5H_5N) is converted into dipyridine ($C_{10}H_{10}N_2$), it is said to be polymerised. Other bodies again exhibit not only identity in percentage composition, but identity of molecular weight. For instance, the formula $C_3H_6O_2$ expresses the molecular weight of propionic acid, methyl acetic ether, and ethyl formic ether. But these bodies are obtained from different sources in different ways, and they yield quite different substances when acted on by the same chemical reagent. It is assumed, therefore, that in such cases the proximate composition of the bodies is different, and attempts are made by modifying the general formula to express the difference of composition. Substances the I. of which is explainable by the assumption of the existence in them of radicles of different magnitudes are called *metameric.* There are other classes of substances the I. of which cannot thus be accounted for. These have the same molecular weight, they exhibit differences, however, in specific gravity, boiling point, and other properties; and while they behave in a similar manner with some chemical reagents, they may behave very differently with others. Such a set of bodies are found in the butylic alcohols, the lactic acids, and other compounds. These might be called isomeric in the strict sense of the term. The difference in such cases is supposed to be explained by assuming that the so-called atoms of carbon, hydrogen, and other elements are united in different ways, and to express these different arrangements *structural* formulæ are employed. Such formulæ are useful for remembering the experimental differences between the bodies.

Isomor'phism. This word, signifying equality of form, was first employed by Mitscherlich to denote a connection which he pointed out between chemical composition and crystalline form, in papers communicated to the Berlin Academy in 1819 and following year. It was well known that quite different bodies, such as galena, common salt, iron pyrites, fluor spar, &c., could crystallise in the same form, but Mitscherlich showed that bodies of quite different composition had the same crystalline form, and that equality of form indicated not exactly the same composition, but similar composition from different elements, and that analogy of composition was often accompanied by similarity of form, and was probably the cause of it. I. is on the whole more strikingly exhibited by classes of compounds than by the elements themselves. In some cases elements are isomorphous, such as arsenic and antimony, and these give rise to isomorphous compounds; but there are isomorphous compounds the analogous elements of which are not isomorphous, as in the case of zinc and iron, and there are also similarly constituted compounds which are not isomorphous. Among the more important and commonly occurring isomorphous groups of salts may be mentioned the alums, the sulphates of which, sulphate of magnesium (Epsom salt), is the type, including sulphate of zinc, nickel, cobalt, iron, and other metals, with the corresponding double sulphates, the chromates and the manganates, the perchlorates and permanganates, the chloride, bromide, and iodide of potassium, the carbonates analogous to Iceland spar, and the compounds of ammonium and potassium, such as the nitrate.

Isop'oda, an order of *Crustacea* (q. v.), in which the head is separable from the first segment, which have feet. The eyes are unstalked, and of compound nature. Generally there are seven pairs of limbs borne on the thorax or chest; the body is more or less flexible, and can be rolled into a ball-shaped form for purposes of defence. The joints of the abdomen are united, and form a broad shield, beneath which the gills are protected. The I. are represented by such genus as the familiar slaters or woodlice (*Oniscus*), and by the water-slaters. Some I. (*Bopyridæ*) live as parasites on other crustacea, and one (*Limnoria terebrans*) bores into wood, and effects great destruction on wooden piers and like erections. The I. first occur as fossils in Devonian rocks.

Is'otherms (Gr. *isos*, 'equal,' and *thermos*, 'warm') are lines drawn through places which have the same mean temperature. The mean temperature may be taken for the summer months, the winter months, or for the whole year; and on account of the irregularity of the configuration of the surface of the earth, these three systems present very different appearances. They give very valuable information as regards the probable nature of the climate of any locality, and are therefore of great importance in meteorology. See CLIMATE.

Ispahan', the largest city of Persia, capital of Irak-Ajami, on the left bank of the Zainderud, and in a rich plain, 220 miles S. of Teheran. It is beautifully embowered in groves and orchards, but its streets are narrow, dirty, and crooked, and part of the city is in ruins, haunted by the jackal and fox. The houses are mostly of earth or brick, and only one storey high, while the bazaars are very extensive, it being possible to walk under cover continuously for some three miles. The principal buildings are the college called Madrasse Shah Sultan Huseyn, the magnificently ornamented gates of which are carved and embossed with verses from the Koran; the college mosque, supporting a fine cupola, and faced by two minarets; the palace of the Chehl Situn (*i.e.*, 'forty columns'), a wonder of marble, glass, and gilding, situated in an immense square, laid out with chenar-trees and artificial lakes, and the modern palace of Fattehabad, a noble pile in good repair. The manufactures include the most expensive velvets and satins, gold and silver trinkets, coarse nankeen and calico, firearms and sword blades, glass, earthenware, sweetmeats, &c. I. has a good water supply, and is the emporium of a large trade with India, Afghanistan, and Turkey. Pop. variously estimated, but is not less than 200,000. I., the capital of Irak under the Califs of Bagdad, was taken in 1387 by Timur, who is said to have put to death 70,000 of the inhabitants. It became the capital of Persia, and one of the greatest cities of Asia under Shah Abbas in the 17th c., but was sacked by the Afghans in 1722. The Kajars made Teheran the capital in 1795.

Israel. See JEWS.

Issoire (anc. *Issiodurum*), a town in the department of Puy-de-Dôme, France, stands on the river Crouze, 20 miles S.S.E. of Clermont by rail, in a plain circled by mountains. It has an interesting old church, St. Paul's, some trade in cattle, hemp, walnut-oil, and wine, and manufactures of woollens and agricultural instruments. Pop. (1872) 5876.

Issoudun, a town in the department of Indre, France, on the Théols, 18 miles N.E. of Chateauroux, connected by rail with Orleans. It has an old church of the 15th c., considerable trade in wine and cattle, and manufactures of wool, linen, ironmongery, and cutlery. Pop. (1872) 14,230.

Iss'ue, in law, means the question of fact submitted to a jury See FEIGNED I.

Iss'us (Gr. *Issos* or *Issoi*), a seaport of Cilicia, Asia Minor, on a bay of the same name, famous as the scene of Alexander the Great's victory over Darius Codomannus in 333 B.C. I. is probably the modern Ajazzo.

***Istalif',** a beautiful town of Afghanistan, on a small tributary of the Cabul river, 20 miles N.N.W. of Cabul. It is terraced on the mountain side, crowned by the magnificent shenars of the Hazrat Eshan's shrine, and girt with the richest orchards and vineyards. The inhabitants, about 15,000 in number, are handsome, agile Tajaks, reputed to be the best of Afghan foot-soldiers. They weave coarse cloth, in which there is a trade with Turkistan. I. was in great part destroyed by the British in 1842.

Isth'mian Games, forming one of the four Pan-Hellenic festivals, derived their name from the Corinthian isthmus on which they were celebrated in honour of Poseidon (Neptune). The temple of Poseidon was situated at the narrowest part of the isthmus, and near it were the theatre and stadium of white marble. This festival was said to have been instituted by Sisyphus and restored by Theseus, and was originally held every eighth year, but after Olymp. 49 every third year. The games were the same as those held at Olympia, including, besides athletic exercises and horse and chariot racing, contests in music and poetry. Victors were crowned with a simple pine-garland, and their statues were placed in the famous temple, while their envied success reflected high honour alike on their family and birthplace. The management of the games was conducted by the Corinthians, but certain honourable distinctions were reserved for the Athenians. In 228 B.C. the Romans were privileged to take part in the games, and it is conjectured that soon after the time of Cæsar there began to be introduced fights with

wild beasts. At a late period of the Roman Empire the games had been sunk into coarse gladiatorial shows, but they continued to be celebrated till the 4th c. A.D.

Isth'mus (Gr.) is the name of a narrow neck of land connecting two continents, *e.g.*, the isthmuses of Darien and Suez, or a peninsula with the mainland, *e.g.*, the I. of Corinth, to which the name was perhaps first applied. It was often used alone by the Hellenes to designate this particular I.

Is'tria (anc. *Histria*), an Austrian markgrafdom, of which the greater part is a peninsula running into the Adriatic near its northern end. It now forms part of the Austrian Küstenland. The surface is mountainous, the highest peak being Monte Maggiore, 4400 feet high. The climate is warm and dry, but exposed to biting winds. The soil produces oil, figs, and excellent wine in abundance. The inhabitants, Italian in the town, and Slavic in the country districts, live by shipbuilding, sea-going, salt-boiling, cattle-breeding, and oil and wine manufacture. The coast is full of good harbours. I. formed a part of the old kingdom of Illyria. Rovigno, Capo d'Istria, and Pirano are among the towns. Area, 1908 sq. miles; pop. (1869) 254,076.

Italian Art. (1) *Painting.*—The founder of Italian painting was Cimabue (q. v.), born about 1240, and his pupil Giotto (q. v.) freed art from stiffness and Byzantine mannerism, and is the first great representative of the Florentine school. Orcagna, who died about 1370, produced gloomy and grotesque works, illustrating the faith of medieval Christianity; and a school of religious painters, characterised by sweetness, delicate imagination, and mystic piety of spirit, arose at Siena during the 14th c. Among the Italian painters belonging to the 14th c. are Gaddi, Giottino, Giovanni da Melano, Spinello, Aretino, Pietro, &c. From 1400 to 1470 is a second great period. Art became more varied and fanciful in subject, and gained rapidly a mastery of technicalities. Perspective and anatomy were studied, religious allegories yielded to scenes and figures from everyday life. Among the leading painters of this period were Masaccio (q. v.), Uccello, Castagno, and Gozzoli. As the 15th c. advances Italian painting becomes gradually imbued with the Renaissance spirit—with naturalism, vivacity, and love of classic themes—Leonardo da Vinci being the link between the 15th c. artists and the great 16th c. masters Michael Angelo and Raphael. In the works of Lippo Lippi, Filippino Lippi, Mantegna, Botticelli, and Ghirlandajo we trace the dawn of a new artistic spirit, while Fra Angelico stands apart, his works reflecting the visionary medieval spirit. From 1470 to 1550 may be roughly regarded as the period in which the influence of the Renaissance on painting is strongest—in which Italian art culminates. To the latter part of the 15th c. belong Mantegna, Perugino, Francia, the Bellini, Signorelli, and Fra Bartolommeo. This period abounds in work splendid in conception and exquisite in execution, but not attained to the unrivalled grandeur and beauty of the period embraced in the first half of the 16th c.—the age of Michael Angelo (q. v.), Raphael (q. v.), Giorgione (q. v.), Correggio (q. v.), Andrea del Sarto (q. v.), and Titian (q. v.). Leonardo da Vinci (q. v.) might chronologically be ranked among the earlier cluster of the Renaissance painters, as he died in 1510 but ranks with the greatest masters of the 16th c. Leonardo's work is exquisitely subtle and original, with a grotesque, bizarre element absent from Raphael's creations, which are the perfection of harmony, accurate design, and luminous beauty. Correggio's paintings show almost no passion or deep thought, they are unsurpassed for blooming, delicate colour, for wanton, sensuous loveliness. The Venetian school was a later outcome than the Florentine, and achieved for colour what the Florentine did for form. The great Venetian paintings are far less thoughtful and subtle than the Florentine; they display the utmost glory of sensuous beauty, the sublimity of noble colour. The greatest Venetian masters are Veronese (q. v.), whose works are a splendid reflection of material gorgeousness; Tintoretto (q. v.), a stormy, fiery genius, who loved the most daring and tragic themes; and Titian (q. v.), who carried the mastery of glowing yet unsating colour to the height of achievable perfection. Among the secondary Venetians were Palma, Bonifazio, Bordone, the Robusti, the Caliari, the Bassani. In the great 16th c. painters, Italian art gained its zenith, and decadence rapidly ensued. Among the later painters are the Carracci (q. v.), Guido (q. v.), Domenichino (q. v.), and Caravaggio (q. v.). But pictorial art became steadily more sensual and strained, and in the Bolognese and Neapolitan schools degenerated into coarse animalism, depicting repulsive scenes of bloodshed and sensuality. Of this last stage of artistic degradation the leading representative is Salvator Rosa (q. v.). Besides the works of Vasari and Lanzi, see Rosini, *Storia della Pittura Italiana* (Pisa, 2d ed. 7 vols. 1848–52); and Crowe and Cavalcaselle, *History of Painting in Italy* (Lond. 1864–66).

(2) *Music.*—In Italy the old Græco-Roman melodies were partly adapted to Christian hymns, and in the 4th c. Bishop Ambrosius introduced religious chaunts adapted to the four modes of the Greeks. Gregory the Great in the 6th c. gave a new development to religious music, founded many singing schools, and elaborated the choral song, the foundation of church music. (See GREGORY THE GREAT and GREGORIAN CHAUNT.) Guido of Arezzo, a Benedictine of the 13th c., improved the manner of writing musical notes, and divided the scale into hecachords. Music, favoured by the Popes, was gradually viewed as a science. Many instruments were invented in the 15th c., and in the 16th notable composers appeared in Palestrina, Felice Anerio, and Nanini da Vallerano. Venice and Rome were the great musical centres, but the nation as a whole was renowned throughout Europe for prominence in music. In the 17th c. operas began to be performed, and the severe state church music of the 15th and 16th centuries gave place to a florid, somewhat effeminate, and more popular style. Unfortunately the zealous culture of vocal music led to the comparative neglect of instrumentation, and consequently, the Italian music is lacking in depth and richness of harmony. Among the 17th c. composers are Sully, Corelli, and Frescobaldi. To the 18th c. belong the famous violinist Paganini, and the composers Caldara, Bresciancllo, Galuppi, Jomelli, Porpora, Pergolese, Piccini, Cherubini, &c. The leading composers of the 19th c. are Spontini, Bellini, Donizetti, Verdi, and Rossini.

(3) *Architecture.*—'Italian architecture' is the name given to the style which arose in Italy in the 15th c., and which was formed by an adaptation of the old Roman style. Its founder was Filippo Brunelleschi. Inspired with enthusiasm for classical antiquity by the newly-discovered work of Vitruvius, he studied with zealous assiduity the architectural relics of the Eternal City, and his cupola of the cathedral at Florence is a masterpiece of artistic beauty and boldness. The new style was not a slavish reproduction of old buildings, but a free imitation of the massive edifices of ancient Rome. Its great fault was a want of unity, the general form of the structures being modern, while the parts were copied from various ancient models. Brunelleschi's most distinguished successors in the 15th c. were Leone Battista Alberti, Michelozzo, Michelozzi, and Benedetto da Majano, the authors of the fine Florentine palace style. Three schools of Italian architecture are reckoned—the Venetian, Florentine, and Roman—the last bearing a closer resemblance than the others to the ancient classical style. The Renaissance gave a great impetus to the imitation of antique structures, and a large number of churches, built on semi-classic designs, were raised in Italy, being distinguished especially by the introduction of the Dome (q. v.). Of these, by far the noblest is St. Peter's in Rome. From the 16th c. the greatest names in Italian architecture are Bramante, whose Romanesque work is frequent in Rome; Peruzzi, architect of the Farnesina and the Palazzo Massimi; San Gallo, who planned the Palazzo Farnese; Vignolo, Fontana, Giocondo, Falconetto, San Michelé, of whose works some beautiful specimens may be seen at Canossa, Verona, and Venice, Sansovino, Palladio (q. v.), whose fame is over all Western Europe, Ammanati, Maderno, Bernini, Borromini, Simonetti, Morelli, and Poletti.

Italian Language and Literature. (1) *Language.*—Like the French, the I. L. is a branch of the *Romana Rustica*, or provincial Latin of the Empire, mingled with barbaric words. The Italian speech early abounded in dialectic varieties, due partly to provincial differences in the *Romana Rustica*, and partly to the divergences of race among the Teutonic barbarians. (See ROMANCE LANGUAGES.) The classic literary speech seems to have arisen from the language spoken in the Italian cities, which was mainly cultivated by Tuscan writers. Consequently the literary language is mainly Tuscan, though the other provinces contributed largely to enrich it. The speech

received new strength and majesty from Dante, new polish from Boccaccio, while Petrarch imbued it with a peculiar softness and pliancy from his study of the Provençal. At the end of the 14th c. it was in a condition of the ripest culture. During the 16th c. Italian was temporarily injured by the Renaissance enthusiasm for Latin, but was speedily re-established as the medium of literature. The chief dialects of modern Italian are:—The Sicilian, which shows traces of Greek, Arabic, Norman, Provençal, and French; the Neapolitan; the Calabrian; the Roman, at first the rudest of all the dialects, and now the most intelligible, though not the most polished; Norcian; the Tuscan, which contains several distinct branches; the Bolognese, inelegant and truncated; the Venetian, the softest and most musical; the Friulian, which has a large French and Slavonic element; the Paduan; the Lombardian, at one extremity shading into the Venetian, and at the other resembling the Bolognese, and including (1) the Bergamese, harsh and contracted; (2) the Milanese, showing Northern influence in its consonant endings; and (3) the Piedmontese, a blending of Italian and French; the Genoese has also much in common with the French, while the Corsican is said to show strong affinity with the Tuscan, and the Sardinian is a many-coloured dialect, in which Carthaginian, Greek, Arabic, Gothic, Frankish, and Aragonese words are, as it were, crumbled down and imbedded.

The Italians cannot hitherto be said to have treated the grammar of their language with scientific thoroughness. The first who collected observations on the language was Cardinal Bembo, whose work, begun in 1500, first appeared in 1525 under the title *Prose*. Only a few small unimportant works, by Fortunio, Liburnio, Marcantonio Flaminio, appeared earlier. The *Prose*, in the form of a dialogue, are neither thorough nor complete, and treat only of Boccaccio and Petrarch. The exertions of Count Trissino to regulate and establish orthography, after a long struggle, only resulted in the letters *v* and *j* being recognised as proper consonants. Other grammatical works, which formed at this time epochs, and exercised a lasting influence, are the *Ercolano* of Barchi (Flor. 1570), the object of which was to establish the claims of the Florentines to the right of self-government in language; the *Avvertimenti della Lingua* by Salviati (2 vols. Ven. and Flor. 1584-86), which treated diffusely of letters, and some of the parts of speech, especially the noun and article; *Della lingua Toscana* by Buommattei (Flor. 1648), the first tolerably complete grammar, adopted and published by the *Accademia della Crusca* as their own. A rich mine of observations and examples is to be found in the *Osservazioni della Lingua* by Cinonio (Ant. Mambelli, part 1, Forli, 1685; part 2, Ferrara, 1644; 4 vols. Milan, 1809), where the verbs and particles are treated in alphabetical order. A most erudite and bold work is that of Bartoli, *Il Torto e'l Diritto del non si può* (Rome, 1655). The first systematic, complete grammar, furnished with good examples, and from which almost all later ones have sprung, is *Regole et Osservazioni*, by Corticelli (Bolog. 1785). Mastrofini (1814), Nannucci (from 1813), Gherardini, Antolini have published works on individual parts of the language. The most of the later Italian grammars, such as those by Ambrosoli, Ponza, Biagioli, Valentini, Robello, Troya, Semeria, Puoti, &c., are of no importance. There are some admirable German works on the Italian tongue—*e.g.*, the *Ital. Sprachlehre* by Fernow (2 parts, Tüb. 1804); and Blanc's *Ital. Grammatik* (Halle, 1840), which is the first attempt at a historico-etymological work on the language.

Italian lexicography begins in the 16th c. with a collection of words by Minerbi (1535), Fabricio de Luna (1536), and Accaritio (1543). *Le Ricchezze della lingua Volgare* (1543), and *Della Fabbrica del Mondo* (1546), by Alunno, are somewhat richer. A more complete lexicon is the *Memoriale della Lingua* by Pergamini (1658). At length there was published, first in Venice (1612), the *Vocabolario degli Accademici della Crusca*, which was limited with pedantic strictness almost exclusively to the writers of the *Trecento* and to the Florentines, who had collected with great diligence all mutilations, all improper expressions and phrases of the people, but had paid no attention to the language of science and art. A second slightly changed edition was published at Venice (1623); the third, considerably enlarged (3 vols. 1691); and the fourth (6 vols. 1729-38) at Florence. The publication of a fifth edition, much richer in words and examples, but entirely in the spirit of the earlier editions, was begun in 1843 at Florence. This work has been made the basis of many others, amongst which are the lexicons of Ant. Cesari (6 vols. Verona, 1806) and Guiseppi Manuzzi (4 vols. Flor. 1836-44; 2d ed. 1862, *et seq.*). The first not Florentine but really Italian dictionary is the *Dizionario Enciclopedico*, by Francesco Alberti (6 vols. Lucca, 1797-1805). Of the later large dictionaries, the best are *Dizionario della Lingua Italiana* (7 vols. Bolog. 1819-26), *Dizionario Universale della Lingua Italiana*, by Mortara, Bellini, Codagni, and Mainardi (8 vols. Mant. 1845-56), the dictionaries by Tommaseo and Bellini (Turin, 1864, *et seq.*), Carena (2 vols. Turin, 1851-53), Bolza (Vien. 1851-53), Fanfani (2 vols. Flor. 1855; *Vocabulario dell' uso Toscano*, Flor. 1863), Trinchera (2 vols. Milan, 1864). Tommaseo (6th ed. 2 vols. Milan, 1855), and Zechini (new ed. Turin, 1864) are the authors of dictionaries of Italian synonyms.

(2) *Literature.*—The history of I. L. begins in the 12th c., the earliest poet of note being a Sicilian, Ciullo d'Alcamo, who died in 1194. Between D'Alcamo and Dante the chief writers were Bruno, Anselmo, Brunetto Latini, Guinicelli, Ruggieri, and Fra Guittone d'Arezzo. Contemporary with Dante, the principal poet was Guido Cavalcanti. After Dante (q. v.), the greatest medieval poet, the chief writers were Boccaccio (q. v.) and Petrarch (q. v.). The age from 1400 to 1500—the time when the Italian Renaissance was in full bloom—produced a throng of elegant scholars. (See RENAISSANCE.) The leading poets of the epoch were Poliziano (q. v.), Pulci (q. v.), and Boiardo (q. v.). During this period, authors enamoured of the loveliness of the revived classical literature strove to ignore medieval writings, to replace the Italian speech by Latin as the language of culture. Poliziano, however, introduced a new epoch, by blending classic and Italian influences, by instilling classic purity of style into the Italian tongue. Among other writers of this age are Ugolino, and Michel Verini, Naldio, Pontano, Landino, and Sannazzaro (q. v.). From 1500 to 1600 is the second great period in I. L.—the age of the poets Ariosto (q. v.), Trissino, Ruccellai, Bembo, (q. v.), Pietro Aretino (q. v.), Castiglione, Fracastoro, Berni (q. v.), Guarini (q. v.), and Tasso (q. v.). The poetry of the age is full of a sensual gorgeousness, and breathes a peculiar ironical, indifferent spirit, while it is occasionally servile and emasculate in its tone. Among the chief writers of fiction, which was generally lively and indecent, are Bandello, Firenzuola, Grazzini, Straparola, Parabosco, and Giraldi. The greatest prose writers are Guicciardini (q. v.) and Macchiavelli (q. v.). Other historians of this period are Bembo (q. v.), Giovio, Nardi, Sarpi (q. v.), Bartoli, Bentivoglio, &c. The interest of much of the history is marred by an unfortunate tendency to ape the manner of Livy and other Latin historians, leading to dreary diffuseness and stilted rhetoric. The 17th c. is a time of poetic decline, but is rich in prose. Among the poets are Filicaja, Chiabrera, Marini, Tassoni, and Redi, while the prose writers include Speroni, Castiglione, Massuccio, Davila (q. v.), &c. The verse of the time was marred by the affectations of the *Seicentisti*, a school of writers of whom the foremost was Marini, who indulged in strange euphemistic freaks. To the 18th c. belong the poets Fortiguerra, Frugoni, Maffei, Ricco-boni, Metastasio (q. v.), Goldoni (q. v.), Gozzi (q. v.), Alfieri (q. v.), Monti (q. v.). The greatest Italian historian of the century is Muratori (q. v.). Other historians of the 18th c. are Tiraboschi and Giannone.

To the 19th c. belong the poets Manzoni (q. v.), Maffei, Leopardi (q. v.), Silvio Pellico (q. v.), Foscolo (q. v.), Tommaseo, Borghi, Arici, Taddei, Grossi, Prati, Niccolini, Giusti (q. v.), Baldachini, Torti, Barbieri, Sestini, &c.; the prose-writers Coletta, Botta, Litta, Cantu, Amari, La Farina, Farini, Balbo, Villari, Corniani, Selvatico; the philosophers, Galluppi, Gioberti (q. v.), Mamiani, and Rosmini. Manzoni has founded a school of writers of historical novels, among whom are Rosmini, Grossi, Cantu, D'Azeglio (q. v.), and Guerrazzi (q. v.). The patriot and political theorist Mazzini (q. v.) also deserves honourable mention. The long struggle against Austria imbued Italian literature with a rebellious, patriotic spirit, which found vent occasionally in bitter mockery and sorrowful retrospect, and at last in jubilant enthusiasm. None of the most recent Italian writers have produced a masterpiece, but much of their poetry is fervid, sweet, and graceful, and the new school of fiction is marked by delicacy of sentiment and considerable psychological insight and skill in the representation of manners. Many of the best-known Italian writers of this century have owed their popularity to the politi-

cal tenor of their works rather than to their intrinsic literary merits, and, as a whole, the recent I. L. will not bear comparison with the recent literature of Germany or of France. The Italian prose writings of the present age rank higher than the contemporary Italian poetry, and periodical literature is now being widely cultivated. The great variety of dialects prevailing in the country has all along partly crippled Italian authors, many of whom could only acquire command of the classic Tuscan by dint of studious effort. This drawback will, in all likelihood, gradually vanish now that Italy has been formed into a united nation.

Of the works on the history of I. L., besides the numerous writings on the history of the literature and of the scholars of individual provinces and towns, the following are conspicuous:—Crescimbeni, *Storia della volgar Poesia* (6 vols. Rome, 1698; Venice, 1731); Quadrio, *Storia e Ragione d'ogni Poesia* (7 vols. Bologna, 1739; Milan, 1741-52); Mazzucchelli, *Gli Scrittori d'Italia* (vols. i.–vi., Brescia, 1753-63), in alphabetical order, but only embracing the two first letters; Tiraboschi, *Storia della Letteratura Italiana* (14 vols. Modena, 1772-83; 16 vols. 1787-94; 12 vols. Rome, 1785; 16 vols. Milan, 1822-26, and since often reprinted), on which all later works are based, and which found a continuator in Lombardi in the *Storia della Letteratura Italiana nel Secolo* 18 (4 vols. Modena, 1827-30), and in Levati in the *Saggio sulla Storia della Letteratura Italiana ne' primi* 25 *Anni del Secolo* 19 (Milan, 1831); Corniani, *Secoli della Letteratura Italiana* (9 vols. Brescia, 1818-19; continued by Ticozzi, 2 vols. Milan, 1832-33); Ugoni, *Della Letteratura Italiana* (3 vols. Brescia, 1820-22); Maffei, *Storia della Letteratura Italiana* (2d ed. 4 vols. Milan, 1834); Emiliani-Giudici, *Storia della Letteratura Italiana* (2d ed. 2 vols. Flor. 1855); Rovani, *Storia delle Lettere e belle Arti in Italia* (3 vols. Milan, 1856-58); Ambrosoli, *Manuale della Letteratura Italiana* (2d ed. 4 vols. Flor. 1864); Ruth, *Geschichte der Ital. Poesie* (2 vols. Leips. 1844-47; new ed. 1867); Ebert, *Handbuch der Ital. Nationalliteratur* (Marburg, 1863).

Ital'ic Ver'sion (Lat. *Vetus Itala*) was a Latin version of the Scriptures, the Old Testament being from the LXX. It differed slightly from the Vetus Latina of the North African Church, and was that which was in common use in the N. of Italy till Jerome (died 420) produced his Vulgate (q. v.).

It'aly (*Regno d'Italia*), the midmost of the three great peninsulas in the S. of Europe, is only connected in the N. with the mainland where it is bounded W. by France, N. by the Swiss cantons of Valais, Uri, and the Grisons, and by Austrian Tyrol and Carinthia, E. by Austrian Carniola, extending in lat. 36° 42'-46° 40' N. and long 6° 35'-18° 30' E. In outline it is strikingly like a long, high-heeled boot, which stretches in a direction S.E., and parallel to the coast-line of Austria and Turkey, and the toe of which, the Calabrian promontory, approaches, at the Strait of Messina, the island of Sicily. It is washed on the E. by the Adriatic, S. by the Ionian Sea, and W. by the Tyrrhene and Ligurian Seas, and has a coast-line of 3237 miles, broken by few deep indentations. Proceeding along the coast from N.W., the chief promontories are Portofino in the Gulf of Genoa; Piombino and Ortobello in the Maremma; Cape Linaro S. of Civita Vecchia; Cape of Anzo S. of the Tiber; the rocky headlands of Circello, Algalone, and Posilipo, Cape Campanella, separating the Bay of Naples from the Gulf of Salerno; Capes Licosa, Palinoro, Falconara, and Vaticano; Spartivento, in the extreme S. of Calabria; Capes delle' Colonne and Santa Maria di Luca on either side of the Gulf of Taranto; and on the Adriatic side, the peninsula of Gargano (the spur of the Italian boot), the Point of Ancona, and the delta of the Po. The chief inlets besides those already mentioned are the sheltered Gulf of Spezia (the great naval arsenal of I.), the Bay of Grosseto, the Gulfs of Gaeta, Policastro, Santa Eufemia, and Squillace; and in the Adriatic, the Gulfs of Manfredonia, and Venice. Among the principal islands, which are treated of in separate articles, are Sicily, Sardinia, the Lipari Isles, Ischia, and Capria without the Bay of Naples; Ponza Isles further N., and Elba opposite Piombino. The mainland has an extreme length of 830 miles, and a mean breadth of 138 miles. I. is divided into 69 provinces, grouped in 16 compartments, and subdivided into 197 circles (*circondari*), in which are 8382 communes or townships. The country is generally regarded as comprising the three sections of Northern, Central, and Southern I., and the areas and the populations of its provinces was as follows, according to the census of 1861 and of 31st December 1871:—

Provinces.	Area in sq. miles.	Pop. 1861.	Pop. 1871.

Physical Aspect.—The surface of I. is rich in the beauty of its rivers and flora, extends in broad, fertile plains, and rises in snow-capped mountain masses, enclosing fair, sequestered valleys. The backbone of the peninsula is the chain of the Apennines (q. v.), which forms near Genoa a continuation of the Maritime Alps, traverses the entire length of I., and attains in Monte Corno (the Gran Sasso d'Italia), among the wild highlands of Abruzzo, its greatest height of 9590 feet. Other peaks to the S. of Monte Corno, as Mont Amaro or Majella (9131 feet), Monte Vellino (8180), Monte Meta (7835), and Monte Pollino (7070), are capped with snow for some nine months in the year. Steep and rocky around the Gulf of Genoa and towards the Adriatic, the Apennines for the most part decline gently to the plains on the N. and W., here and there throwing out minor spurs. In the N. of I. the Alps (q v.) form a magnificent circling frontier, in which the principal heights are Mont Blanc (15,798 feet), Monte Rosa (15,210), the Matterhorn (14,833), Monte Viso (12,567), and Mont Cenis (11,457); the two chief summits lying wholly in I. are the Grand Paradis (13,300), and the beautiful Grivola or Corne de Cogne (13,028), offshoots of the Graian Alps. Although sloping gradually to the N., the Alps are scarped and precipitous towards I., so that while the Rhone has a fall of 5250 feet in 92 miles, the Po makes an equal descent in 22 miles. The height of the snow-line is 9500 feet, and the whole Alpine chain abounds in glaciers, there being over 400 between Mont Blanc and Tyrol, some of which are about 15 miles long and 2½ wide, with a depth of 1640 feet. The chief passes are the Col di Tenda (5890 feet), Mont Cenis (6772), Great St. Bernard (8169), Simplon (6575), St. Gothard (6804), Splügen (6942), Brenner (4659), Stelvio (9095), and Semmering (4287). *Plains.*—The great northern plain of I., including Piedmont, Lombardy, and Emilia, and forming the basin of the Po, is unrivalled in the richness of its soil, the wealth of its productions, the density of its population, and the number of its towns. The other plains of I. are those of Venetia, Tuscany, Romagna, Campagna (Terra di Lavoro), and the Tavoliere of Apulia, from which the fine plain of Basilicata stretches round the Gulf of Taranto. The Roman plain is barren and desolate, but the coast-plains of Southern I. are singularly beautiful and luxuriantly fertile. *Valleys.*—Of the Alpine valleys, the only two that have a longitudinal direction are those of Aosta and the Valtelline. The other large valleys, some thirty-six in number, are normal to the chain, and most of them contain beautiful lakes, and send down copious streams. The valleys in the wild highlands of Abruzzo and Calabria are famed alike for their wealth of brilliant vegetation and charms of scenery. Vallombrosa, through which the Arno flows, and 'where the Etrurian shades high over-archt imbowr,' is hallowed by Milton's well-known lines.

Hydrography.—Owing to the peninsular character of I. and the direction of the mountains there are few important rivers, but innumerable mountain torrents. By far the largest river is the Po (q. v.), which rises in Monte Viso, on the French border, flows through Piedmont, separates Lombardy from Parma, Modena, and Ferrara, and enters the Adriatic by several channels about 30 miles S. of Venice, after a course of 330 miles. The chief of its many tributaries are, from the N., the Dora Baltea, Sesia, Ticino, Adda, Oglio, and Mincio; and from the S., the Tanaro, Trebbia, Nure, Taro, Parma, and Secchia. The Po annually deposits at its mouth forty million cubic feet of alluvium, thus extending its delta yearly at a mean of 230 feet. Among the other rivers of I. are the Adige, Brenta, Piave, Tagliamento, Aterno, Sangro, Metaura, and Ofanto, flowing into the Adriatic; the Arno, Tiber, Ombrone, Garigliano, and Volturno, entering the Tyrrhenian Sea; and the Bradano and Basente, draining into the Gulf of Taranto. Most of the rivers are only navigable to barges or coasting boats. *Lakes.*—I. is studded with many fine lakes, the chief of which are cradled in the Alpine valleys, as Maggiore, Como, Garda, &c., and are each celebrated for unique, enchanting beauties. Garda (45 miles long) is the largest, and Maggiore (perhaps the most beautiful), contains the famous Borromean Islands (q. v.). Other lakes are the Castiglione and Orbitella in the Tuscan Maremma, Chiusa, also in Tuscany; Perugia, in Umbria; Bolsena and Bracciano in Latium; Fondi in Caserta; Fucino in Abruzzo; and Salpi on the coast of Apulia. The coast valleys of Comacchio, S. of the Po, now form an immense pool or lagoon, 164 miles in circuit, and from 3 to 6 feet deep, in which there are valuable fisheries. *Canals.*—There are numerous canals, for irrigation as well as traffic, in the N. of I., the finest being the Canal Cavour in Piedmont, with a length of 52 miles, and the Naviglio Grande or Ticinello, 28 miles long, connecting Milan with the Ticino. The latter was begun in 1179, and many of the other canals are also of early date. Extensive canals have been constructed for the drainage of the Pontine marshes. The total length of canals in I. is 435 miles. I. has a vast number of mineral and thermal springs.

Geology and Mineralogy.—The great basin of the Po, the coast-region from Genoa to Civita Vecchia, and the entire belt between the Apennines and the Adriatic, are covered with Tertiary and post-Tertiary strata. The higher ridges of the Alps consist of gneiss and other primary rocks, flanked with limestone, sandstone, slate, &c. The Apennines as far as Calabria are formed of calcareous and serpentine rocks, and of graywacke, on which lie thick deposits of gypsum and beds of sulphur. But the most notable feature in the geology of I. is its volcanic system, comprising the Euganean hills of Lombardy, the group of Santa Fiora in Tuscany, Viterbo and the formations around Rome, Sant' Agata, Rocca Morfina, and Vesuvius (the only active volcano on the European continent), with its Campi Flegrei (Phlegræan Fields), Etna, in Sicily, and Stromboli, &c., in the Lipari Isles. Extinct craters abound throughout the whole length of the Apennines, and the territories of Arezzo, Perugia, Spoleto, &c., present the best-known examples in the world of volcanic action in their broken surfaces. The minerals of I. are numerous, but are not mined extensively. In the Alps are found iron, copper, lead, quicksilver, rock-salt, and some gold and silver; in the Apennines, copper, quicksilver, cobalt, manganese, &c. Coal is plentiful in Venetia and Tuscany, and in various parts occur salt, alum, and borax. Of great value are the volcanic products, nitre, sulphur, and lava; nearly all the sulphur employed in Europe is obtained from Sicily. Other minerals are the sea-green marble of Bocchetta, the gold-veined of Porto Venere, the statuary marble of Carrara, the jasper of Berga, the black marble of Pistoja, the giallo and lapis-lazuli of Siena, the alabaster of Volterra, the porphyries and rock-crystals of Aosta, and the chalcedonies and agates of Tuscany.

Climate.—The climate of I. is singularly fine, in spite of the winter severity in the N. and the almost tropical heat in the S. In the great northern plains the lakes freeze in winter, and the orange and lemon will not ripen in the open air; the central and southern plains are favoured with an almost perpetual spring. Snow falls, on an average, only two days annually at Rome, Florence, Naples, and Palermo, and five days at Venice. The annual mean temperature at Genoa is 61° F., at Florence 59°, at Bologna 58°, at Milan and Venice 56°, at Rome 60°, at Naples 61°, and at Syracuse 65°; the highest temperature at Rome is 95°, and in Sicily 104°. In the N. and in the interior it rains more during summer than winter, while the reverse is the case along the coast and in the S. The annual rainfall at Perugia is 39 inches, at Genoa 52, at Florence 49, and at Naples 34. During summer a deadly malaria is generated in the Tuscan Maremma, in the Pontine marshes and Venetian lagoons. Unfavourable winds are the tramontana or piercing wind of the mountains, and the blighting sirocco, which frequently sweeps the southern coasts.

Botany and Agriculture.—In I. are drawn together the characteristic floras of Western Asia, of N. Africa, and of all the countries of Europe. According to Cesati, the flowering plants of Lombardy alone number 2568 species. Among the tropical plants which grow in the S. are the cotton-plant, sugar-cane, date-palm, pistachio and papyrus; the Indian fig, a species of cactus, grows wild in Sicily. The oak and chestnut clothe the mountain sides to a height of 4000 feet; wheat thrives at 4500 feet, and the beech at 6000. The Apennines in Central I. are covered with a rich vegetation up to 3200 feet, while the lower zone is occupied by the palm, orange, citron, and olive. Above the dense forests and fine pasture of the Alps the *Alpine flora* rises to a height of 9500 feet, comprising the juniper, alder, rhododendron, willow, saxifrages, mosses, &c. The total extent of the forests in I. is about 12,350,000 acres. Except in the N., agriculture is in an extremely backward state. In abundant years the supply of grain exceeds the consumption, and in years of scarcity it falls short by about one-tenth. Two-fifths of the surface is arable, and the chief crops are wheat, maize, rye, barley, oats, and rice. Other important products are silk, wine

(780,000,000 gallons, of which 208,000,000 are yielded by Sicily), oil (30,560,000 gallons), hemp (50,000 tons), and tobacco (325,000 metric quintals). The mulberry is extensively cultivated, and the fruits exported are oranges, citrons, lemons, dates, melons, &c. The vine flourishes everywhere, but the wines are inferior to those of Spain and France, and they are mainly exported from Naples and Sicily. The finest Sicilian wines are those of Marsala; the choicest of Naples are the red *Lacryma Christi* and *Vino d'Asti.* There is considerable dairy-farming in Lombardy, and the produce of cheese and butter is valued at not less than £3,000,000.

Zoology.—Among the wild animals of I. are the wolf, lynx, boar, deer, marmot, fox, and wild-cat, and characteristic birds are the vulture, ibis, pelican, and flamingo. Various species of African water-fowl are found on the southern coast; the small birds *ortolans* and *beccafico* are esteemed as dainties. The tunny, anchovy, sardine, pilchard and mackerel fisheries of the Mediterranean are of great value. The rivers yield large quantities of salmon, trout, sturgeon, lampreys, tench, barbel, &c., while the lagoons abound with eels. Locusts occasionally appear in devastating swarms; butterflies are remarkable for their variety and beauty; and the seas are rich in molluscs, crustaceans, sponges, corals, &c. The bee and silkworm are of great economic importance, and a feature of insect life is the nocturnal firefly. Of the domestic animals the estimated number of black cattle or oxen is 3,700,000, of sheep and goats 12,000,000, of horses and mules 1,400,000, and of swine 4,000,000. I. has a comparatively small number of cattle.

Manufactures.—The principal manufacture is silk, the yearly value of spun silk alone being £5,200,000, independent of the tissues, among which the most valuable is velvet, produced of especially fine quality at Genoa. Woollens are manufactured, particularly at Biella and other places in Piedmont, to the value of £2,640,000. The cotton industry flourishes in Liguria, Piedmont, Lombardy, and Friuli, the production of spun cotton amounting to £1,400,000, and of cotton cloths to £3,200,000. There is an extensive straw-plait industry, chiefly at Leghorn and throughout Tuscany. So defective is the manufacture of wines, that they deteriorate with keeping, and are unfit to bear transport. Celebrated manufactures are the filigree work of Genoa, the coral ornaments of Naples and Leghorn, the wrought marbles of Carrara and Lucca, the perfumery and essences of Tuscany, and the mirrors, mosaics, and enamels of Venice. The traditionary skill of the Ligurian shipbuilders is now aided by good technical schools, especially by the Nautical Institute of Genoa. In 1875 there were in construction at fifteen shipyards of Liguria 103 vessels of 107,900 tons, or 1057 tons each.

Commerce.—The exports, silks, olive-oil, sulphur, fruits, anchovies, &c., amounted in 1875 to £42,286,040; the imports, the hardware and textiles of Great Britain, wool from the Levant, corn from Odessa, &c., to £48,602,040. Most of the raw and thrown silk imported into England from France is not produced in that country but in I. In 1874 there entered the ports of I. 118,446 vessels of 12,053,330 tons, and cleared 117,010 of 11,976,143 tons. The mercantile marine consisted in 1876 of 17,562 sailing vessels and 103 steamers, with a total of 949,813 tons.

Railways, &c.—In 1876 there were 4817 miles of railway open for traffic, of which 1016 belonged to the state. Since the opening of the Mont Cenis (see CENIS, MONT) tunnel in 1870 the E. Indian mails from England have been conveyed *via* Brindisi. The line across the Semmering Pass, completed in 1853, connects the railway system of I. with that of Austria. In 1876 there were 12,622 miles of telegraph lines, about two-thirds of which belong to the state.

Finance.—The budget for 1876 estimated the total receipts at £53,766,564, and the expenditure at £58,917,672. Since the establishment of the kingdom in 1866 till 1876 there have been deficits varying in amount from £1,743,000 to £24,668,000 in 1866. In 1875 the public debt amounted to 400 millions sterling. The deficits have been produced chiefly by the vicissitudes of the revolution, by military expenses, and by the construction of railways. The money, weights, and measures of I. are the same in all but name as those of France; the lira of 100 centisimi = the franc, or 25s. sterling.

Army and Navy.—By law of 7th June 1875, all men capable of carrying arms are held liable for service till the end of their thirty-ninth year, and must serve eight or nine years in the standing army, three or four in the milice mobile (*Landwehr*), and seven in the milice territoriale (*Landsturm*). In 1876 the standing army comprised a total of 409,426 (20,171 on peace furlough), besides 13,694 officers; the additional reserves bringing it up to a total of 867,886, with 18,836 officers. The artillery has a total of 1640 pieces. In 1876 the navy consisted of 81 war-vessels, carrying 671 guns, having a force of 13,316 sailors and marines. It includes two of the most powerful ironclads yet constructed, viz., the *Duilio* and *Dandolo,* double turret-ships, with armour 22 inches thick throughout, armed each with four 100-ton Armstrong guns. Two enormous vessels are designed, to be called the *Italia* and *Vittoria Emmanuele,* each to be of 14,000 tons, covered with armour of 36 inches. Under the superintendence of the able Minister, Saint Bon, the navy is being gradually transformed.

Education.—The percentage of the population that could not read was 78·29 in 1861, and 73·29 in 1871. Elementary instruction is now compulsory and gratuitous. There are 43,380 elementary schools, with (1872) 1,745,467 pupils, and several normal schools, giving a three years' course, attended by some 6000 intending masters and mistresses. Classical instruction is given in 104 national gymnasia to 8268 pupils, and in 79 royal lyceums to 3773 pupils. The Government technical schools, with physico-mathematical, commercial, agronomical, and industrial sections, are 135 in number, and have 10,659 pupils. At Milan and Portici are two large agricultural schools. Besides the 17 universities, Bologna, Padua, Florence, Rome, Naples, &c., with their 10,524 students, there are 3 free universities, 3 institutions for engineers, and 2 for literary and scientific culture. Of the 33 public libraries of I., the most important is the Magliabecchiana at Florence, with 280,000 printed vols. and 14,000 MSS. The state grant for education is £600,000.

Religion.—The *Statuto fondamentale del Regno* enacts in its first article that 'the Catholic Apostolic and Roman religion is the sole religion of the state.' A royal decree of 9th October 1870 declared that 'Rome and the Roman provinces shall constitute an integral part of the kingdom of I.,' and recognised the Pope as supreme head of the Church, retaining his dignities as a reigning prince, and all other prerogatives of absolute and independent sovereignty. The hierarchy in I. consists of 45 archbishops and 198 bishops. But the royal consent to the installation of a bishop or archbishop is now necessary. According to the census of 1871 the population comprised 26,658,679 Roman Catholics, 58,651 Protestants, 35,356 Jews, and 48,468 of other or of no professed faith. Freedom of worship, formerly denied except to the Waldensians in Piedmont, is now allowed throughout the country. The suppression by Government of several of the orders, and the enforced sale of their land, has greatly curtailed the Church revenues. In 1869 there were seven priests to every thousand inhabitants.

Government and Administration.—The Government of I. is a limited monarchy, established by constitution of 17th March 1861. The legislative power is vested in the King and in a Parliament consisting of a Senato, the members of which (270 in 1876) are nominated by the King for life, and in a Camera de' Deputati of 508 deputies, elected by a free suffrage. Neither senators nor deputies receive any salary or other indemnity. Entire freedom of the press and right of association are among the constitutional liberties. The Government appoints prefects of provinces and syndics of towns, and most of the governmental offices are elective. The judicial system of I. comprises conciliatory judges, who conciliate litigants and settle minor cases; prætors, who have jurisdiction of offences punishable with three months' imprisonment or a fine not exceeding £12, and decide civil cases not involving more than £60; tribunals with which lie appeals from the prætors, and above which are higher courts of appeal and courts of cassation. Little satisfaction has resulted as yet from the system of juries before the courts of assize.

History.—For the history of Italy to the fall of the Roman Empire see ROME. On the dethronement of Romulus Augustulus in 476, Zeno the Byzantine Emperor was nominally made ruler of Italy, the real power in that country being wielded by Odoacer, King of the Heruli, who bore the title of Imperial Regent. In 489 Theodoric, King of the Ostrogoths, overthrew Odoacer, founded a Gothic monarchy in Italy, and restored the country to a prosperity unknown since the days of the Antonines. But on Theodoric's death in 526 the shortlived Teutonic kingdom began to crumble away, and the hopes of a united Italy were

lost. In the reign of Justinian the Byzantine troops drove the Ostrogoths from Italy, which was then governed for the Eastern emperors by an exarch, who dwelt at Ravenna (see EXARCHATE). In 568 the Lombards (q. v.) poured into Northern Italy, founded a kingdom there, and threatened the imperial power. Meanwhile, as the exarch's influence weakened, the papal power increased, aided largely by Gregory the Great's conversion of the Lombard Arians to the Catholic faith, and by the rupture between the Eastern and Western Churches, which loosened the bonds holding Italy to the Byzantine Empire. About the middle of the 8th c. the Pope, unable to withstand the Lombards, and deserted by the emperors, appealed to the Franks, and after the Papacy received aid from Pippin, the Frankish ruler, and from Karl the Great, the latter was proclaimed Emperor at Rome in 800, and the Western Empire was restored. Under Karl's feeble successors the Italian nobles became practically independent sovereigns, and the country was invaded by the Saracens, who seized on Southern Italy. At the close of the 9th c. the Byzantine power revived in the S., the Greeks wrested part of the land from the Saracens, and constituted it a province of the Eastern Empire under a ruler entitled the *Patrician*. On the breaking up of the Karoling Empire in 887, Italy became a separate kingdom and the scene of strife between various Teutonic invaders; the land was ravaged by Norsemen and Magyars, and the power of the Papacy dwindled. At length, in 962, Otto the Great, King of the Germans, put an end to the feeble line of Italian kings, and was crowned Emperor at Rome. Henceforth the sovereign of Italy was a German prince, whose authority repeatedly waxed and waned, and was speedily assailed by the growing power of the Papacy and the great Italian cities, which were now becoming independent republics. In the first half of the 10th c. the Normans conquered Calabria, Apulia, and Sicily, and destroyed the commerce of the southern cities, whose maritime greatness devolved upon Venice, Genoa, and Pisa. The Lombard cities, of which the chief was Milan, became practically independent, though owning a shadowy allegiance to the Holy Roman Empire. But during the great struggle between Heinrich IV. and Hildebrand (see HEINRICH IV. and GREGORY VII.) in the latter part of the 11th c., they mostly supported the Pope. Free civic life flourished far more vigorously in Italy than in any other country during the middle ages. This was due to the absence of any strong central power, and to the fact that Italy was never permanently occupied by any of the Teutonic tribes who destroyed the empire, and was more deeply impressed with Roman municipal institutions than any other part of Europe. Unfortunately the great Italian republics were bitterly jealous of each other, and instead of uniting in a compact federation, by playing into the hands of foreign rulers led to the prolonged enslavement of Italy. The failure of the Teutons to found a compact kingdom in Italy, and the evil effects of the Holy Roman Empire, kept the country broken up into small mutually jealous states until the recent establishment of the Italian kingdom. Medieval Italian history is much more complicated than the history of any other European state, the influences at work being far more varied. The republics never held all the land, never flung off formal allegiance to the Emperor of the Romans; their constitutions were partly inherited from Roman times, but were greatly modified by Teutonic influences, excepting in the case of Venice, which was isolated from the rest of Italy, and was never under a Teutonic ruler. Feudalism never took deep root in Italy—the nobles being early forced into the ranks of citizens in the great republics—except in the S., where the weakness of the nominal Greek rule favoured the growth of independent sovereignties. During the struggle between the papal and imperial power, most of the leading cities embraced the Guelphic cause, though many—and notably Pisa—aided the Emperor. (See GUELPHS AND GHIBELLINES, GREGORY VII., HEINRICH IV.) On Friedrich I.'s (q. v.) invasion of Italy, in the latter part of the 12th c., the northern cities banded against him in the Lombard League, and finally, after their victory at Legnano (1176), reduced the imperial power in Italy to a nominal suzerainty. During the 12th and 13th centuries the Italian republics were in their zenith of power. (See FLORENCE, MILAN, GENOA, VENICE, PISA.) The 14th and 15th centuries are the 'age of the despots'—the period when free civic government was supplanted by tyrannies, in which Italy remained destitute of central government and almost devoid of republican rule, while she was still only slightly influenced by feudalism. The banishment of the popes to Avignon removed the papal influence, which, though not strong enough to submit Italy to the rule of the pontiffs, kept the various powers of the peninsula in a kind of vague coherence, and was able to check the growth of an independent state in the N. The rise of the tyrants was favoured by the overlordship wielded by the Pope and Emperor, who gave a show of legitimate rule to adventurers willing to become their partisans. In the 15th c. the military spirit of the Italians dwindled away owing to the custom of employing mercenaries, the force of the various states and cities was sapped by endless virulent feuds, and at the end of the century the discovery of America diverted commerce from I. to Western Europe. When France, England, Austria, and Spain had become compact nations, I. was a cluster of contending princedoms. Her rulers, instead of confederating, in which lay their only hope of safety, endeavoured to use France, Spain, and Austria for the furtherance of their ends in Italian politics. The result was that I. was reduced to become the arena on which European quarrels were fought out. In 1494 Charles VIII. of France invaded the peninsula; his successor, Louis XII., made a similar expedition; and I. was the scene of the long contest between François I. and Karl V. During the 16th c., I., though ruled by Italians, was mainly in the power of Karl V.'s successors on the Spanish throne; and by the treaty of Lyons, in 1601, the French were excluded from the peninsula, and the change of Savoy into an Italian state was greatly advanced. In 1631 Mantua and Montferrat were bestowed on Charles of Nevers, who supported the French interests; and in the latter half of the century Louis XIV. made attempts on Savoy. But during the 17th c. I. enjoyed comparative peace until 1696, when the war of the Spanish Succession (q. v.), broke out. Austria seized Milan, Mantua, and Montferrat in 1706, and Naples and Sardinia in 1714. Savoy won Sicily, and handed over that island to Austria, receiving Sardinia in its stead, from which the house of Savoy took their royal title. Before 1750 all I., saving a few isolated republics and the Papal States, was divided among the houses of Lorraine, Bourbon, and Savoy. Forty years of slavery and apathy followed, till in 1792 the French Republic invaded Savoy. Napoleon (q. v.) formed the Cisalpine Republic in 1796, and the Roman Republic in 1798, and in 1804 added the crown of Italy to his imperial crown, making his brother Joseph king of Naples in 1805. In 1815 the affairs of Italy were reconstituted by the Congress of Vienna. Austria annexed the Lombardo-Venetian provinces; the Archduke Ferdinand of Austria became again Grand Duke of Tuscany; the King of Sardinia was restored to his dominions; the papal territories were almost wholly restored; and Ferdinand IV. was made King of the Two Sicilies. The Italians, galled by the detested Austrian rule, formed secret societies, of which the chief was that of the Carbonari (q. v.), to create a free united Italy, but in 1821 the Austrians quelled the revolutionary forces, and restored the former tyranny in Piedmont, Sicily, and Naples. Austria then established a system of terrorism and inquisitorial oppression throughout the country. Abortive revolutions flared out in Modena and the papal territory in 1831, and the Italians vainly looked for French succour. About this time the party known as Young Italy was founded by Giuseppe Mazzini (q. v.), whose aim was to expel the Austrians by a volunteer army, and until 1844 repeated but futile efforts were made to shake off the Austrian yoke. Another party, that of the *Moderates*, now arose, who looked forward to a united Italian kingdom. In 1848 the struggle with Austria was renewed in the north, but the King of Sardinia was beaten at Custozo, and the Austrians placed the country under martial law. About this time Garibaldi (q. v.) emerged as a guerilla leader in the N.; the Moderate party declined, and the Republicans strengthened; war was renewed; the Piedmontese were defeated at Novara (1849); but a republic was established at Rome, with Mazzini at its head. The French now assailed the Italians, and Garibaldi, after beating King Ferdinand's army at Palestrina, held Rome for about a month, when the French captured the city. Insurrection was again foiled. The Italians now began to look to Victor Emmanuel, King of Sardinia, as their champion. In 1859 he formed an alliance with France. The French entered Italy, beat the Austrians at Magenta and Solferino, and in 1860 Tuscany, Modena, Parma, and Romagna were united to Sardinia. In the same year Gari-

baldi with a volunteer force overthrew the atrocious despotism of Sicily and Naples, and Victor Emmanuel, who had forbidden Garibaldi's expedition, reaped the benefits, being proclaimed King of all Italy, and receiving Sicily and Naples. Venetia and the Papal States were still to be freed. In 1866 Italy took advantage of the Austro-Prussian war to wrest Venetia from Austria. In the following year Garibaldi marched on Rome. He routed the papal troops at Monte Rotondo, but the French Emperor's army defeated the Italians at Mentana. In 1870, after Napoleon III. surrendered at Sedan, Victor Emmanuel seized Rome, which became the capital of Italy, and the temporal power of the Pope came to an end. Since then Italy has made great progress in political reform and in mercantile and agricultural prosperity.

Itch, or **Scab'ies**, is an affection of the skin, characterised by scaliness, vesicles, and in some cases by pustules and excoriations. It is accompanied with excessive itching, which is augmented by warmth and stimulating food and drinks, giving rise to accidental abrasions and scratches. I. is caused by the *acarus scabiei*, which burrows within the epidermis and excites the papillary surface of the derma. The scaliness is caused by the burrowing of the *acarus*. On the surface of the vesicle there is a minute spot or streak, the point of entrance within the epidermis, and from it a whitish line may be traced into the neighbouring epidermis—the *burrow* of the acarus—and at its termination, under a slight elevation of the epidermis, the acarus lies concealed. The eruption of I. is most common between the fingers, at first, and from thence it extends to the wrists, flexures of the elbow, axillæ, abdomen, and the whole body. The most prominent symptom is intense itching, which is increased by scratching. When the patient is young and robust, I. spreads rapidly, and causes insupportable pruritis; but when weak and infirm, its progress is slow, the eruption partial, and the itching moderate. I. may be confounded with eczema, prurigo, lichen, impetigo, and ecthyma; but in I. there is the peculiar scaliness and undermining of the epidermis, the conical vesicles with acuminated and transparent points, and the *actual presence* of the acarus, which may be placed under the microscope. I. is always communicated by contact either immediately or through the contact of clothing. In strong and healthy children, the period of incubation is from two to four days; but in adults the usual period is a week or ten days, and during winter it may be extended to a fortnight or three weeks, and among the aged the period may be more extended still. The treatment of I. is purely local, the object being the extermination of the acarus and its ova. The first step to be taken is the preparation of the skin for the reception of medicaments by a thorough ablution with a warm solution of subcarbonate of potash, containing about half a pound to a gallon of water. After drying the skin, simple sulphur ointment should be rubbed into the entire skin, particularly into the affected parts morning and evening, for two days. Flannel should be worn next the skin during treatment, and on the morning of the third day the body should be washed with warm water and soap. The process should be repeated to secure the destruction of ova which may not have been developed at the time of treatment. All articles of clothing should be boiled or exposed to a high temperature, or destroyed, to ensure the destruction of the acari and ova. Instead of the sulphur ointment, *stavesacre ointment* may be similarly used for four days, four times a day. Sponging with vinegar may be adopted in the case of young children. See *Diseases of the Skin*, by Erasmus Wilson.

Itch-Mite (*Sarcoptes scabiei*), a genus of *Arachnida* (q. v.) belonging to the *Acarina* or mite order, and infesting the human skin, in which it develops pustules, noted for the intense itching and irritation they produce. The I.-M. was first recognised in the 12 c. by an Arabian author as the cause of the itch disease, but the existence of the animal was long regarded as hypothetical. The body is rounded and oval shaped; the mandibles or jaws are of needle-like conformation; and the legs very short, and composed each of three joints. The female itch insect differs from the male in having the two hinder pairs of legs only partially developed, each leg ending in a long bristle. The average length of the female I.-M. is about one-fifth or one-sixth of a line in length, and one-seventh in breadth. The surface of the body is covered with bristles. Allied species infest the horse (*S. equi*), cat (*S. felix*), dog (*S. canis*), and pig.

Ith'aca, now **Ithaki** or **Thiaki**, one of the Ionian Islands (q. v.), the smallest next to Paxo, situated a little to the N.E. of Cephalonia (q. v.). Its area of 35½ sq. miles presents a constant succession of rugged limestone crags, with some pleasant valleys interspersed. The soil is light but well tilled, and the climate very healthy. The pop. is 11,910, and that of Vathi, the chief town, 3372. I. was the island of Ulysses (q. v.). There still exist cyclopean ruins of great antiquity, and many places seem to bear identification with scenes in Homer's poems.

Ith'aca, the capital of Tompkin's County, in the State of New York, U.S., on the Cayuga Lake, 180 miles N.W. of New York city, with which it is connected by railway. It is a busy centre of the Pennsylvania anthracite coal-trade, and the seat of Cornell University (q. v.), which in 1872 had 33 resident professors and 494 students. The manufactures are glass, leather, paper, calendar clocks, machinery, &c. Pop. (1870) 8462.

Itin'erary (the Lat. *itinerarium*, from *iter*, 'a journey'), a list of the stations between two main points of a route, together with the distances between them. The chief writings of this kind preserved from antiquity are *Itineraria Antonini*, comprising *I. provinciarum*, which gives the routes between the different Roman provinces of Europe, Asia, and Africa, and *I. maritimum*, a catalogue of the sea-passages most used; *I. Hierosolymitanum*, written by a Christian in 333 A.D. for the use of travellers from Burdigala (Bordeaux) to Jerusalem (best edition of both, Pinder and Parthey, Berl. 1848); and *I. Alexandri* (published by Angelo Mai at Milan, 1817), an account of Alexander the Great's expedition to Persia, drawn up about 338 A.D.

It'ri, a town of S. Italy, in the province of Caserta, half-way between Fondi and Gaeta, is a poor but picturesque place, with a ruined castle, and is best known in connection with Fra Diavolo (q. v.), who was born here in 1760. Pop. (1871) 6542.

I'tu, or **Y'tu**, a town of Brazil, in the province of São Paulo, 3 miles from the S. bank of the Tiete, and 48 N.W. of São Paulo, is a thriving centre of agricultural produce, and has some fine churches, two convents, a lazaretto, &c. Large quantities of sugar are produced in the neighbourhood, and I. has celebrated breeds of horses and mules. Pop. about 10,000.

Iturbide, Don Augustin de, a Mexican usurper, the son of a Biscayan nobleman and a creole, was born at Valladolid, Mexico, September 27, 1783. He joined the army in 1805, and received command of the 'army of the north' in 1820. On the Mexican revolution in 1822 he was proclaimed Emperor (18th May), but soon quarrelled with Congress, and was forced to abdicate. He removed to Europe, but landing in Mexico in 1824 with revolutionary designs, was seized by the authorities at Padilla, and shot. 19th July 1824. In the year of his death he published an autobiography (Eng. trans. by Quin, same year).

Itz'ehoe, a town of Prussia, in the province of Slesvig-Holstein, on the navigable Stör, 15 miles from its entrance into the Elbe, and 60 N.W. of Hamburg by rail. It has manufactures of tobacco, cement, chicory, &c., also distilleries and sugar-refineries. Pop. (1875) 9786. I. arose about a castle built here by Karl the Great in 809, and bore the names successively of Esseveldoburg and Eselsfleth, or Ezeho. It was joined to Holstein by Adolf IV. in 1238, and became the residence of the Holstein Dukes. In the Thirty Years' War it was twice taken by Tilly, and was partly destroyed by the Swedes in 1657.

Iu'lus, the genus of *Myriapoda* (q. v.), including the forms familiarly known as *Millepedes*, or 'thousand-feet,' and as 'hairy worms'—the supposed 'hairs' seen on the sides of the body being in reality numerous and minute legs. The I. is nearly related to the Centipede (q. v.). The body is cylindrical, and the head large and distinct. The antennæ are long and many-jointed; the eyes simple, and situated at the base of the feelers. The average length is about 2½ or 3 inches. The I. is found beneath the bark of trees, under stones, moss, and in damp places generally. It has the power of rolling the body for defence into a spiral form, the feet being contained within the inner whorl of the spire. The I. form the type of the order *Chilognatha*, in which the mandibles or larger jaws are without *palpi* or feelers, and are covered by a lower lip or labium formed of the united *maxillæ* or lesser jaws. *I. terrestris* is a familiar species; others are *I. Canadensis* found in N. America, and *I. multistriatus* in the Western States of America.

Ivan', or **Iwan** (Russian form of the Gr. *Joannes*, Eng. John), is the name of six Russian Grand-Dukes and Czars. During the Mongol dominion, **I. I. Danilovitch Kalita** (*i.e.*, 'money-bag,' from his constantly carrying such to relieve the poor), Grand-Duke of Moscow, 1328–1340, sought to make his city the capital of Russia, and succeeded in removing thither from Vladimir the seat of the Metropolitan. His younger son, **I. II. Ivanovitch** (1353–59), lost in battle with the Lithuanians a wide extent of land on the Dnieper, and died a monk.—**I. III.** (as Czar, **I. I.**) **Vasiljevitch the Great** (1462–1505), founder of the Russian Empire, was born 22d January 1440. Gradually uniting the other Russian duchies with that of Moscow, he freed Russia from the Mongol power, and subdued Novgorod in 1478. In 1472 he married Sophia, niece of the last Byzantine Emperor, which gave him a claim on the Greek Empire, and led to the double-headed Byzantine eagle being placed on the Russian arms. He died October 1503 at Moscow.—**I. II. Vasiljevitch Grosnji** (*i.e.*, 'terrible'), Czar 1533–84, grandson of the preceding, was born 25th August 1530. He did more than all his predecessors to further the civilisation of his half-savage people, but his cruelty was excessive. In his reign foreign, especially German, artisans and scholars were introduced into Russia. Trade, which at that time could only be carried on through Archangel, he promoted by striking a treaty with Elizabeth of England. He established a standing army, the Strelitzes. Though unfortunate in his wars with Poland and Sweden for Livonia, I. extended his dominions with the conquest of Kasan (1552) and of Astrakhan (1554), the remains of the Mongol realm, and acquired Siberia by accepting Jermak Timofejev's offer of submission. He died 18th March 1584.—**I. III. Alexievitch**, of the house of Romanov, elder half-brother of Peter the Great, and father of Anna Ivanovna (q. v.), was born in 1666, and in 1682 became Czar together with Peter. Weakness of mind and body unfitted him for power. He resigned in 1688, and died 29th January 1696.—**I. IV. Antonovitch**, grandson of the preceding, son of Prince Anton Ulrich of Brunswick-Wolfenbüttel and the Russian Grand-Duchess Anna Carlovna (q. v.), born 23d August 1740, was by his great-aunt the Empress Anna appointed her successor, and at her death, when only two months old, was proclaimed Czar under the regency of Biron. In a few days Biron was displaced by I.'s mother, but I. had already (6th December 1741) been dethroned by Elizabeth, daughter of Peter the Great. She placed him in several prisons in succession, and finally at Schlüsselburg. Here, during the reign of Catherine II., in consequence of an attempt of a Lieutenant Mirovitch to deliver him, he was put to death (16th July 1764), which the garrison were ordered to do in the last extremity.

Ivan'ova, a village of Russia, on the river Uvod, in the government of Vladimir, 215 miles N.E. of Moscow, in a territory possessed by the Counts Sheremetieff since 1714. From the extent of its manufacturing industry, I. has been called the Russian Manchester. It has itself 130 calico factories, annually preparing one million pieces, and as the centre of the cotton manufacture of Russia, gives employment to 50,000 operatives here and in the surrounding district, producing goods yearly to the value of 2½ million pounds sterling. Pop. (1870) 6000.

Ives, St., a seaport and market-town, N. coast of Cornwall, 15 miles N.W. of Land's End, lies at the N.E. extremity of a deep bay of the same name, and has a commodious harbour. The chief industry is the pilchard-fishery, but boat-building is also carried on (in 1875 23 vessels of 390 tons), and there are valuable tin and copper mines in the neighbourhood. A line connecting St. I. with the W. Cornwall Railway was opened in May 1877. St. I. returns one member to Parliament. Pop. (1871) 6965.

Ives, St., a town of England, in Huntingdonshire, 72 miles N. of London by rail, on the left bank of the Ouse, which is here crossed by an ancient bridge of six arches. Brewing and malting are the leading industries. Pop. (1871) 3248. Its earlier name, Slepe, survived in Slepe Hall, the residence of Oliver Cromwell (1631–35).

Ivi'za (Lat. *Ebūsus* or *Ebūsus*), the larger of two islands in the Mediterranean, forming part of the Balearic group, and anciently known as the Pityusæ Insulæ, now belonging to the Spanish province of Mallorca. *Ophiussa* (now Formentara), the other island, was uninhabited. Area of I., 221 sq. miles; pop. 22,170. The chief town, I., is fortified, has a harbour, and exports salt. Pop. 5100.

I'vory (Fr. *ivoire*, from the Lat. *ebur*, Sansk. *ibha*, 'an elephant'), a dense substance of bony nature used in the arts, and obtained from various animals. I. represents the largely developed tooth substance (or *dentine*) of such animals as the elephant, mammoth, narwhal, hippopotamus, &c. The microscopic investigation of I. shows that its substance is perforated by numerous fine tubes, which open internally into the central portion or *pulp cavity* of the tooth, and which by their outer extremities come in contact with the under surface of the enamel or cement which coats the tooth. The tubes of I. exhibit gentle curvatures, and divide and subdivide in a regular and dichotomous manner. The average diameter of these tubules is the $\frac{1}{1500}$th of an inch, and in a living tooth they contain infinitesimal prolongations of the pulp substance. Chemically examined, I. contains less *animal* matter than bone; 28 parts of animal matter existing to 72 of earthy or mineral matter in 100 parts of I. The large development of I. in the Elephant (q. v.), is due to the continuous growth of the teeth, which spring from permanent pulps, the upper incisors or front teeth forming the tusks. In the narwhal the great development of a single tooth, the exact nature of which is undetermined, produces a long spirally-twisted horn, which may attain a length of 8 or 9 feet.

Elephant I. is very valuable as an article of commerce, and is obtained from three sources—1st, from the tusks of the Asiatic elephant, 2d, from the African elephant, and 3d, from the fossil remains of the mammoth or great prehistoric elephant. Asiatic I. is very white, but tends to become yellow on exposure to the air, and on this account is less valuable than the African variety. The latter in its green or fresh state has a warm tint, and no appearance of grain, but as the oil it contains dissipates the I. whitens; it has usually a closer texture, works harder, and takes a better polish than the Asiatic. It is the most valuable article of commerce in Central Africa, and by all the trade routes from the interior vast quantities are sent out annually. The mammoth I., found in great abundance in the N. of Siberia, supplies the Russian market, and a portion of it finds its way to Great Britain. It is of a rather marbly white appearance, and is comparatively brittle. I. has been a favourite substance on which to execute artistic carvings from the most remote period, and the existence of plaques of very large size favours the opinion that the ancients possessed a means of artificially flattening it which is now lost. At the present day the demand for I. far exceeds the supply, and it constantly tends to increase in value. It is used for knife handles, billiard balls, pianoforte keys, for inlaying, and innumerable other useful and ornamental purposes. Dieppe is now, perhaps, the most extensive I.-factory in Europe.

Ivory, Vegetable. This article, now in extensive use as a substitute for ivory, is obtained from one or two species of *Palms* constituting the genus *Phytelephas*, abounding in the lower eastern slopes of the Andes, and descending along the course of the rivers a few hundred miles. In *P. macrocarpa* the fruit is 9 to 12 inches in diameter, containing numerous carpels, of which only four are fertilised. The albumen of the unripe seeds is drunk while watery, or rather when it becomes fleshy, the taste being something like that of cocoa-nut in the same immature state; but when ripe it is so hard and ivory-like as to defy the teeth of any animal, and becomes the I.-nut of commerce, chiefly employed in the manufacture of buttons, umbrella handles, knobs for doors, inlaying, and toys.

Ivre'a, the *Eporedia* of the Romans, colonised by them as a bulwark against the Alpine tribes, a town of North Italy, on the Dora Baltea, and 33 miles N.E. of Turin. It has a bishop's residence, a citadel, and an old cathedral. Pop. (1874) 9125. The Markgrafdom of I., created by Karl the Great after the conquest of the kingdom of Lombardy, took its name from this town. After Karl III. was driven out of Italy in 887, the Markgrafs of I. were among the aspirants to the crown of Italy, of which Berengar possessed himself in 950. When the Markgraf Harduin set himself up as king in opposition to the Emperor Heinrich II., and was overcome, Heinrich incorporated I. (1018) in the German Empire. Friedrich II. granted it to the House of Savoy, to which it still belongs.

Ivry, a town to the S.E. of the walls of Paris, and near the left bank of the Seine, in the department of that name. The

chief industries are ropemaking and the manufacture of animal charcoal and chemicals. Pop. (1872) 1989; of commune, 11,176.

I'vy (Old Eng. *ifig;* Ger. *epheu;* med. Lat. *iva;* yew is from the same word, written *iua*). Common I. is the *Hedera Helix* of botanists, the only British representative of the natural order *Araliaceæ*, and certainly one of the best-known constituents of British flora. There are many varieties, though Dr. Hooker limits the genus to two species. I. thrives poorly in the United States, owing to greater extremes of climate. The medicinal properties are of no importance.

Ixi'on, according to early Hellenic tradition, was a Thessalian prince, and king of the Lapithæ or Phlegyes. After his marriage with Dia he treacherously murdered her father, Deïoneus, who had demanded certain bridal gifts. All the gods were indignant, but Zeus purified him of the crime, after which the ingrate strove to win the love of Hera. Zeus created a phantom resembling her, and by it I. became the father of the Centaurs. For his lust and treachery he was chained by Hermes to a winged or fiery wheel, which whirled perpetually in the lower world or in the air.

Ixmiquil'pan, a town of Mexico, in the state of Hidalgo, on the river Montezuma, 80 miles N. of the city of Mexico. In its vicinity are several silver-mines, owned by English companies. For several months in 1861 it was the headquarters of General Zuloaga, who claimed to be President of the Republic. Pop. 10,000, mostly Otomi Indians.

Izucar', a thriving town of Mexico, in the state of Puebla, near the base of Popocatepetl, and in the rich valley of the Mescala. It is the S. terminus of a railway from Puebla (constructed in 1875), and has a trade in the sugar and other products of the country. Pop. 12,000. General Matamoros gained a great victory at I. over the Spainards, 24th February 1812.

J.

J the tenth letter in the English alphabet, occupying the same position as in the Latin and Phœnician. In Greek it was unknown, and the Phœnician *jod* or *yodh* was sounded something between a *y* and a soft *g*. In Latin it was not distinguished in form from *i*; and indeed it is only within the last three centuries that it has been differentiated in writing from that vowel, by being merely continued below the line. In German it is pronounced as *y*; in Spanish as a guttural aspirate; in French as *zh*; and in English as *dzh*, precisely the sound of the soft *g*. J occurs in many of the Oriental alphabets; and English is the only language into which it can be translated without the awkwardness of a double consonant. Examples of its interchanges are: Lat. *jugum*, Ger. *joch*, Gr. *zygon*, Eng. yoke; Eng. 'journey' and 'journal,' from Lat. *diurnus*; Ital. *Giovanni*, from Lat. and Gr. *Ioannes*.

As an abbreviation, J.P. stands for justice of the peace.

Ja'biru (*Myctĕria*), a genus of *Grallatorial* or wading birds, represented by the Australian J. (*M. Australis*), and by other species. These birds belong to the *Ciconinæ* or sub-family of the storks. The bill is very large, and has its tip turned upwards. The second and third quills are the longest. The species occur in S. America, Africa, and Australia. The head and upper part of the neck are destitute of feathers. The birds may measure from 4 to 5 feet in height. The Australian J. is green on the head and neck, the same colour, but darker, prevailing on the back. The food consists of fishes, and especially of eels; nearly two pounds of the latter fishes have been taken from the stomach of one specimen.

Jaboran'di, a plant of the natural order *Rutaceæ*, said to be the *Pilocarpus pennatifolius* of Lemaire. An alkaloid named *pilocarpine* has been extracted from the leaves and bark, and in lesser quantity from the wood, by Mr. Gerrard; and experiments on the lower animals showed the following results:—A $\frac{1}{12}$th of a grain injected into the jugular vein produced profuse salivation almost instantly, caused a retardation of the heart's action, and had a marked influence on the blood pressure. In frogs, the smallest doses produced an extremely viscid condition of the skin; larger doses, well-marked neurotic symptoms, and larger still, powerful tetanic spasms. J. applied to the eye contracts the pupil. More recent experiments show that J. has powerful chologue properties, and hence its denomination *vegetable mercury*. In the human subject J. is the most powerful sialogogue and sudorific known. See *Year-Book of Pharmacy* (Lond. 1875), *Edinburgh Medical Journal*, article J., by Dr. W. Craig (1876).

Jab'ua, the capital of the State of the same name, in connection with the Bheel Agency in Central India, 92 miles W. from Mhow. Area of the *state*, 1500 sq. miles; pop. 55,000, mostly Bheels; revenue, £25,000; tribute, £147. The chief is a Rajput, who was loyal during the Mutiny; he is tributary to Holkar.

Jacamar' (*Galbula*), a well-known genus of birds, a species of which inhabits the New World. They are included in the order *Insessores* (q. v.), and in the section *Fissirostres* (q. v.). The sub-family *Galbulinæ*, constructed for their reception, is characterised by a long bill and a tapering tail. In the genus *Galbula* the bill is square and straight, and the nostrils are in a small groove. The tarsi are feathered, and the hinder toe is very small. The food consists of insects. The green J. (*G. viridis*) and Paradise J. (*G. Paradisea*) are familiar species. The latter occurs in Surinam. It is brown, marked with bright hues; the neck and wing-coverts are white; the back has a golden-green lustre; the two central feathers of the tail are very long. In the plumage of the green J. green tints predominate. Its size is about that of the English kingfisher. The allied genus *Jacamerops* includes the great J. (*J. grandis*), also green, with a very broad bill. The genus *Jacamaralcyon* includes the three-toed J. (*J. tridactyla*).

Ja'cana (*Parra*), a genus of *Grallatorial* birds, remarkable for the long toes, which enable them to walk over water-plants. The common J. (*Parra J.*) inhabits S. America; other species are found in Africa, Asia, and Australia. These birds are nearly allied to the Screamers, and are distinguished, as a genus, by a bill which has the sides compressed, by the third quill being the longest, and by the tail being short and partly hidden by its coverts. The head and part of the neck may be naked. The common J. is black. The Chinese J. or Meewa (*Hydrophasianus Sinensis*) is equally at home on land or water. It resembles the pheasant—hence the generic name *hydrophasianus* ('water-pheasant'). The body is a deep chocolate-brown; the head, neck, and throat are white; the back of the neck is orange, and the legs and beak are green.

Jacaran'da, the Brazilian name of the trees that furnish the true Rosewood (q. v.), as well as of several species of Machærium (Leguminosæ), which yield an inferior wood. It is often confounded with the genus J. belonging to Bignoniaceæ.

Jacita'ra Palm (*Desmoncus macracanthos*), one of a genus peculiar to tropical America. The flexible stems climb or trail 50 or 60 feet, and the hooked spines of the leaves are a great annoyance to the traveller. The Indians plait strips of the stems into strainers to extract the poisonous juice from the mandioc.

Jack (*Artocarpus integrifolia*), a species of trees allied to the bread-fruit, is a native of the E. Indies. It produces a much larger fruit than the bread-fruit tree, and the timber, which is at first of pale colour, but subsequently becomes as dark as mahogany, is extensively used for making furniture.

Jack-a-Lantern. See Ignis Fatuus.

Jack'al (a corruption of Sp. and Fr. *chacal*, Pers. *shacal*), a species of *Carnivorous* mammalia, closely allied to the dog, and included in the family *Canidæ*. These animals inhabit Africa and Asia, and are sometimes met with in immense packs. The common J. (*C. aureus*), or Kholah, is found in India, Ceylon, and other parts of Asia. The pupil of the eye is circular, the tail bushy, and the ears prominent and pointed. The dental formula resembles that of the dog. The fur is yellow, which has given origin to the specific name of *aureus*.

Jackal.

The average size is that of a large fox. The J. has frequently been named the 'lion's provider,' from the belief that it guided the king of beasts to prey. But there appears to be no truth in this idea; the J. usually accompanies the larger carnivora in the hope, no doubt, of participating in their prey. The animal

is nocturnal in habits and cowardly in nature. The black-backed J. (*C. mesomelas*) inhabits S. Africa, from which fact it also receives the name of 'Cape J.' It has white and black markings on the back, this peculiarity distinguishing it from the Asiatic species.

Jack'ass, Laughing, the name given by the Australian colonists to the great brown kingfisher, *Dacelo gigantea*, a bird of the family *Halcyonidæ*, tribe *Fissirostres*, and order *Insessores*. It derives its popular name from its peculiar note, resembling a boisterous gurgling laugh, in imitation of which the L. J. is called by the aboriginals the 'gogobera.' Unlike other kingfishers, it does not take its prey from the water. It is invaluable as a destroyer of snakes, and also lives on lizards, insects, and mice. It is easily domesticated, and is then frequently allowed to wander freely about house or garden.

Jack'daw (*Corvus monedula*), a species of *Corvidæ* or crows, distinguished by a grey patch on the crown of the head and at the root of the neck, and by being smaller than the rook or crow. It is a familiar British bird, and is easily tamed and trained to talk. The nest is built in ruined places, crevices of rocks, hollow trees, and like situations; instinct leading the J. to protect its young from stoats and polecats by selecting inaccessible places. The average length of the J. is 14 inches. The eggs number five or six, and are bluish white.

Jack'son, (1) a city of Michigan, U.S., and a great railway junction on the Grand River, 76 miles W. of Detroit. It has extensive foundries, engine-works, sal-soda factories, flour and planing mills, fireclay works, &c., and in the vicinity are productive coal-mines. The city was incorporated in 1857, and is the seat of Michigan State prison. A feature is its fine trotting park. Pop. (1870) 11,447.—(2) The capital of Mississippi, U.S., on the W. side of the Pearl River, 45 miles E. of Vicksburg by rail. It carries on an active trade in cotton and other products, comprises among its public buildings the State-house and penitentiary, institutions for the blind and for the deaf and dumb, and a lunatic asylum, and is the seat of the United States courts. Pop. (1870) 4234, of whom about half are coloured.—(3) A city of Tennessee, U.S., at the junction of the Mississippi Central and the Mobile and Ohio railways, 72 miles N.E. of Memphis. Its cotton trade is important (125 business houses), and it is the seat of the West Tennessee College. Pop. (1870) 4119, rapidly increasing.

Jackson, Andrew, the seventh President of the United States, was born of Scotch-Irish parentage at Waxhaw settlement, in Tennessee, March 15, 1767. After serving through the American Revolution, J. turned lawyer, became senator, judge of the Supreme Court, and major-general of the Tennessee army. In 1813 the Creek Indians made war on the South-western States, and J. defeated them at Talladega, Emuckfaw, and Tallapoosa. He was made major-general of the United States army in 1814, and in that year conducted a vigorous campaign against the British in Florida. From the Spanish he captured Pensacola (September), and (January 8, 1815) successfully defended New Orleans against the attack of General Pakenham. J. was appointed governor of the new territory of Florida in 1821, and was elected to the United States Senate, and nominated by the Tennessee Legislature to the Presidency in 1823. A strong Democrat, he was elected in 1828, and re-elected in 1832. Two struggles marked his period of office the first conducted against the extreme members of his own party in South Carolina, who refused to accept the tariff of lowered import duties; the second against the Federals, who, backed by the National Bank, opposed his re-election. J. deprived the bank of its charter and withdrew from it the public money. He died near Nashville, June 8, 1845. J. was a man of excitable temperament, but was endowed with a natural power for command and an indomitable energy and force of character. See Lives of J. by Eaton (1824), Cobbett (1834), Amos Kendall (1844), and by James Parton (3 vols. New York, 1859).

Jackson, Thomas Jonathan, an American general, was born at Clarksburg, in Virginia, January 21, 1824, was educated at the military academy of West Point, 1842-46, served in the Mexican war, and rose to the rank of lieutenant in 1847, was elected Professor of Mathematics and Military Science in the Virginia State Military Institute in 1852, and was appointed Brigadier-General in the Confederate army in 1861. His resolute conduct at the first battle of Bull Run earned for him the name of 'Stonewall J.' At the junction of the Shenandoah with the Potomac (June 27, 1862), J. defeated a Federal force 70,000 strong under M'Clellan. In August he defeated the Federals at Cedar Mountain and Gainsville; during their first invasion of Maryland, he took Harper's Ferry, with 11,000 prisoners; and at the battle of Chancellorville he successfully attacked the Federal right. When riding back from reconnoitring, he was mistaken by his own men and shot, May 10, 1863. J. was conspicuous for the swift dexterity of his movements, whilst his personal daring and tactical skill earned him the affection and esteem of his soldiers. He moulded the raw Valley Virginians into the famous 'Stonewall brigade.' See *Life of Stonewall J.* by J. Esten Cooke (New York, 1876).

Jackson, William, an English composer of great originality and grace, was born at Exeter, May 1730, studied under Travers of the Chapel Royal in London, and returning to his native city, was appointed organist of the cathedral in 1777. He published four collections of vocal and one of instrumental music, besides three operas, and was the author of *Thirty Letters on Various Subjects, On the Present State of Music*, &c. J. was also a landscape painter, closely following his friend Gainsborough. He died at Exeter, 12th July 1803.

Jack'sonville, a city of Illinois, U.S. situated in a fertile prairie, near the Mauvaiseterre Creek, a branch of Illinois River, 30 miles W. of Springfield by rail. It is known as the 'Athens of the West,' and among its public buildings are various State asylums and the Illinois College (Congregational), Illinois Female College (Methodist), Illinois Conservatory of Music, &c. Its industries in woollens, ironwares, and flour are rapidly developing. Pop. (1870) 9203.

Ja'cob. Of the name J. (Heb.) as in the case of Esau, two different derivations are given, as some say, by different writers: the one from the literal meaning of *akab*, 'to take hold of the heel' (Gen. xxv. 26), the other from the figurative meaning, 'to circumvent' (Gen. xxvii. 36). According to some critics, the chief object of the story of J.'s life after he fled from his home (Gen. xxviii. 1) was to show that the Israelites had no Canaanitish blood in their veins, to assign its proper rank to each of the tribes [the sons of the beloved Rachel, *i.e.*, the tribes of Ephraim, Manasseh, and Benjamin, being the chief, and the sons of Leah (Reuben, Simeon, Levi, Judah, Issachar, and Zebulon) of nobler blood than the sons of the slaves (Dan, Naphtali, Gad, and Asher)], to teach that there ought to be friendly relations between Israel and Syria, and to explain the origin of the worship of teraphim in Israel. The Scripture narrative is familiar to every one. See ESAU.

Jacobabad, or **Khangurh,** the chief town of the Upper Frontier district, Scinde, British India, near the border of Beluchistan, about 200 miles N. of Hydrabad. Pop. (1872) 10,714. It contains the cantonments of the Scinde Horse and Jacob's Rifle Regiment. The town was founded in 1847 by General Sir J. Jacob, to whom it owes its excellent roads, canals, and public buildings. It contains the stone mausoleum of its founder, who died here in 1858. See *Gazetteer of Scinde*, by A. W. Hughes (Lond. 1874).

Jaco'bi, Johann Georg, a German poet, born 2d September 1740, at Düsseldorf, studied at Göttingen, and became Professor of Philosophy and Eloquence at Halle. In 1794, Joseph II. made him Professor of the Fine Arts at Freiburg, in the Breisgau. J. died January 4, 1814. His collected works, chiefly pleasant lyric poems, including also cantatas, operas, and the comedy *Die Wallfahrt nach Compostella*, appeared at Zürich (7 vols. 1807-13). See *Life of J.* by Ittner (Zür. 1825).—**Friedrich Heinrich J.,** brother of the preceding, was born at Düsseldorf, 25th January 1743. After studying at Geneva, and managing his father's business from 1763 to 1772, he was appointed councillor in the Exchequer, and in 1779 privy councillor and 'referent' of taxes in Munich. Returning to Düsseldorf in 1780, he spent his leisure on his estate of Pempelfort in philosophical study and social intercourse. In 1794 he went to Holstein, where he lived until 1804, when he was made a member of the newly-founded Academy of Sciences at Munich, of which he was president from 1807 to 1813. He died 10th March 1819. As the founder of the 'Philosophy of Faith' he makes war alike upon Kant and the rationalism of the Illuminati, maintaining that not only our

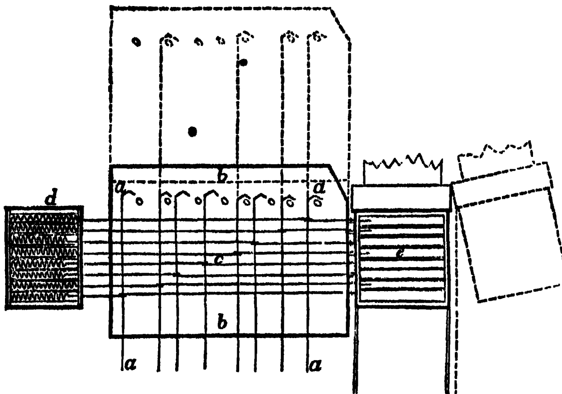
knowledge of the supernatural, but also our certainty of the existence of an external world, depend not on reasoning, but on an immediate acceptance or faith, which he later calls *reason.* The feelings are related to reason as the senses to the understanding, but unlike the senses, are incapable of error. Nature conceals God; the supernatural in man himself reveals him. His whole philosophy is of a subjective nature. Though a mystic, his mysticism did not take the form of dogma. J.'s works, *Allwill's Briefsammlung* (1792), and *Woldemar* (1799), are philosophical romances; *Etwas, was Lessing gesagt hat* (1782), *Briefe über die Lehre des Spinoza* (1785), *David Hume über den Glauben* (1787), *Sendschreiben an Fichte* (1799), *Ueber das Unternehmen des Kriticismus, die Vernunft zu Verstand zu bringen* (1801), *Von den Göttlichen Dingen und ihrer Offenbarung* (1811), are philosophical treatises. His collected writings appeared in 6 vols. (1812–24), his correspondence in 2 vols. (1825–27), followed by the *Briefwechsel zwischen Goethe und J.* (Leips. 1846). See Schlichtegroll, Weiller, and Thiersch, *Friedr. Heinr. J. nach seinem Leben, Lehren und Wirken* (Mün. 1819), and J.'s *Biographie* by Zirngiebl (1867).

Jacobi, Karl Gustav Jakob, a German mathematician, was born at Potsdam, December 10, 1804, studied at the University of Berlin, and in 1827 obtained the Chair of Mathematics at Königsberg. His great work, *Fundamenta Nova Theoriæ Functionum Ellipticarum* (1829), contains only a part of his valuable researches on this abstruse branch of mathematics. He successively visited England, Scotland, France, and Italy, and on his return to Germany removed from Königsberg to Berlin, where he died, February 18, 1851. J. is the author of another work entitled *Canon Arithmeticus* (1839); but it is in Crelle's *Journal für die reine und angewandte Mathematik* that his most powerful and original memoirs appear.—His brother, **Moritz Hermann J.,** born at Potsdam, 21st September 1801, has also won celebrity in applied science. See his discovery, *Die Galvanoplastik* (St. Petersb. 1840), and *Mémoire sur l'Application de l'Electro-Magnetisme au Mouvement des Machines* (St. Petersb. 1836).

Jac'obins, originally the name of the French Dominicans, who were so called from the circumstance that a church dedicated to St. James had been given to them on their settlement in Paris in the 13th c. During the French Revolution of 1789 the chief club of *La Montagne* took the name on account of its meeting in a Dominican monastery in the Rue St. Honoré. At first members of the club were selected from those who sat in the National Assembly, but its privileges were soon enlarged under the government of Robespierre. By its influence and that of the Cordeliers, the revolutionary scene of June 20, 1792, took place, and (July 11) the raising of the insurrectionary army under the walls of Paris, whilst on the 10th of August they dictated their own terms for a National Convention, which met on the 21st of September. 'They are Lords of the Articles,' writes Carlyle, 'they originate debates for the legislative; discuss peace and war; settle beforehand what the legislative is to do.' The death of the king (January 21, 1793), the establishment of the *Comité du Salut Public,* the decree for the arrest of the Girondist members, and the subsequent establishment of a sanguinary despotism, whose acts are known as the Reign of Terror, may all be traced in part to the action of the J. The revolution of the 9th Thermidor (1794) put an end to the club, their hall being closed by an order of the Convention, after which retribution was dealt out to the members. The J. gave rise to an extensive literature of plays, poems, and pamphlets, as *Les Secrets des J., La Jacobiniade, Les Crimes des J.,* published in Paris between 1790 and 1795.

Jac'obites, sometimes used as a name synonymous with the Monophysites (q. v.) of the Eastern Church, are properly confined to Syria and Mesopotamia; their Patriarch, called of Antioch, and always taking the name Ignatius, residing at Diarbekir, according to some authorities at Zaaferan, near Mardin. The name is derived either from the Apostle James (Jacobus), or much more probably from a famous Bishop (Jacobus) of Nisibis in the 6th c., who did much to preserve the sect in a time of persecution.

Jac'obites, the name given to the partisans of James II. after the revolution of 1688. They were most numerous in Scotland, where they stirred up the rebellions of 1715 and 1745. They were not wholly extinguished as a party till the death of Charles Edward Stuart in 1788.



. *Jacobite Songs,* a distinct class of Scotch melodies, in which are celebrated the gallantry of the later princes of the Stuart dynasty, their successes, their misfortunes, their kindliness and gift of personal fascination. These songs are pathetic, humorous, and satirical, and the fine Scottish airs to which they are set, or which have been composed for them, are admirably expressive of the varying shades of sentiment, and afford in themselves high testimony to the racy and genuine musical genius of the Scottish people. Many of the most beautiful and popular of the songs were written either in the present, or towards the close of the last century, in many cases long after all direct personal feeling towards the Stuarts had of necessity died out. Burns was too fully occupied with painting the simple rustic habits of the peasantry to feel much real interest in Jacobite matters, and consequently those of his songs inspired by Jacobite feeling are very few in number. Allan Cunningham, however, and James Hogg have given us many excellent J. S.; the famous 'Wae's me for Prince Charlie,' written by W. Glen of Glasgow, is of modern date, while the less celebrated modern songs by writers in all parts of Scotland are numberless. All the finer airs have been *reset* by one or other of the great musical composers of modern times; but it is questionable whether the sets of the J. S. occurring in Thomson's collection of Scottish songs are surpassed by those in any similar work. See Hogg's *Jacobite Relics* (reissue, Gardner, Paisley, 1874).

Jacob's Ladder (*Polemonium cæruleum*), a plant belonging to the natural order *Polemoniaceæ.* It is a perennial herbaceous plant, with clusters of pretty blue or white flowers, and is frequently cultivated. The plant is astringent.

Jaco'by, Johann, a notable Prussian politician, was born May 1, 1805, in Königsberg, studied medicine there and at Heidelberg, and settled in his native town as a physician. By his professional skill and disinterested kindness of disposition he soon won the love and confidence of his fellow-citizens. It was, however, by his political activity that his reputation spread to wider circles, and when in 1841 his pamphlet *Vier Fragen beantwortet von einem Ostpreussen* (Mannh. 1841), ('Four Questions answered by an East Prussian'), appeared, his name became famous throughout all Germany. This publication upon the constitutional rights of the Prussian people was under the then existing circumstances a great political act, and although the Prussian Government subjected J. to many press prosecutions, he was invariably acquitted. In 1848 he was elected to the Prussian National Assembly, having previously taken part in the Frankfurt preliminary parliament. After the dissolution of the second Prussian Chamber in 1849, J. went back to Frankfurt, and accompanied the 'rump Parliament' to Stuttgart. On his return to Königsberg he was thrown into prison and accused of high treason, but was again acquitted by a Prussian jury, and from that time his whole political life was devoted to the furtherance of the principles of advanced Liberalism. In 1870 he had to expiate a public declaration against the annexation of Alsace and Lorraine by a lengthened imprisonment. He also lost his seat in Parliament. Retiring from public life, he now devoted himself entirely to scientific study. His death took place March 6, 1877. Singularly forbearing towards his opponents, rigid towards himself, inflexible in his opposition to tyranny, of undaunted courage in his advocacy of right and truth, J. will live in the memory of every Prussian patriot. His proud answer to King Wilhelm: 'It is the misfortune of kings that they will not listen to truth,' will long be remembered by his countrymen.

Jacquard', an ingenious apparatus, invented by J. M. Jacquard (born at Lyon, 1752), to facilitate the production of figured silk fabrics. It dispenses with the services of a drawboy, who formerly co-operated with the weaver in manipulating the harness-cords. Jacquard exhibited his valuable machine at Paris in 1801, and five years later the municipality of Lyons purchased the right of applying it to the city looms. For a time manufacturers and operatives bitterly opposed its introduction; but long before the death of the inventor, near Lyon, 7th August 1834, it was fully established in public favour. The J. may be adapted to any figure-weaving loom, enabling the most intricate designs to be as easily produced as plain fabrics. It is fitted to the top of the loom. The diagram shows the principal features of the mechanism in cross-section. Vertical wires *aa,*

arranged in several rows of eight, are at their lower extremities attached to the harness-cords of the loom, while their upper ends

Jacquard.

are bent, and hook on to small bars fixed to a plate *b*, which can be raised at pleasure by means of a long lever in connection with a treadle. Each wire has a companion horizontal needle, through the eye of which it passes. These needles, *c*, are free to move laterally, and with pressure from the right hand they are driven into the box *d*, containing spiral springs, one for each needle. A four-sided barrel, movable on its axis, and pierced on each face with holes coinciding in number and position with the end of the needles, is represented by *e*. It is carried at the lower end of a vibrating frame called the *press*, and when in its lowest position the protruding ends of the needles enter the perforations in the face turned inwards. But if some of the holes be covered, it is obvious that the corresponding needles will be driven into the spring case, thereby carrying their companion wires off their bars, and that the remaining undisturbed wires may then be lifted. This manœuvre is performed by a 'card' of mill-board or stout paper of the same size as a face of the barrel. Each weft thread in the design to be woven has a representative 'card,' perforated in a manner consistent with the needles intended to enter the barrel, or in other words, in accordance with the warp threads to be simultaneously raised for the shot of the weft. The 'cards' requisite to form the whole design are joined in an endless band which travels round the barrel with its rotation. When a 'card' has performed its function of unhooking certain wires, the remainder are drawn up (as indicated by the dotted lines on the diagram), and the warp threads pertaining to them are thereby elevated: the shots of weft and colour as required are then thrown. Simultaneously with the elevation of the wires the *press* is thrown outwards, releasing the compressed springs, which thereon restore the disturbed needles and accompanying wires to their original places. On the descent of the plate the hooks of the replaced wires grasp their respective bars, and the barrel, which meanwhile has made a quarter rotation, presents the next 'card' to the needles. Another series of wires is thus selected for elevation; the same process is repeated through the entire number of perforated 'cards.'

The perforation of the cards is effected by an ingenious machine designed on a principle analogous to the J. The cardmaker is provided with an enlarged pattern, drawn and coloured, of the figure to be woven, and guided by it he *reads in* the design by interlacing threads of weft with vertical cords, which represent the warp. He then draws forward the cords that lie over the weft thread forming the first line of the figure; this tension gives forward motion to certain horizontal needles. A plate, perforated, and holding a punch in each hole, rests in front of the needles, and in front of this *punch-holder* is placed a similar plate called the *punch-receiver*. The needles, which are set in motion by the drawn cords, drive the companion punches from the holder into the receiver; the latter is then removed, and covered with a blank card through which the punches are thrust at one pressing. The receiver and the punches are next restored to their original position, and by manipulating the upper cords of the second line of the figure, another lot of punches is selected, and properly disposed for piercing a second 'card,' and so on through each line of the figure. Each card as produced is numbered, and the whole are afterwards laced together in proper order.

Jacq'uerie, derived from Jacques Bonhomme, the familiar name applied to French rustics, is the name given to the rising of the French peasantry which began (May 1358) in the neighbourhood of Clermont and Beauvais. Though it was simultaneous with a revolt in Paris which had as its aim the imposition of a constitutional check upon the monarchical power, it was not dignified by the same political purpose. After the battle of Poitiers, when Jean II., the Good, was imprisoned in England, and the Dauphin was fighting for existence against Marcel and the King of Navarre, the enslaved peasants found an opportunity for avenging their condition. The rebellion was simply one of hunger and vengeance, and found vent to itself in razing the feudal châteaux to the ground, in outraging and murdering the wives and children of the nobility. An effort was made by Marcel to direct the J. towards a definite revolutionary purpose, but in besieging Meaux, the serfs were routed by Gaston Phœbus and Captal de Buch. In revenge the peasantry were subjected to a prolonged and sanguinary massacre at the hands of the nobility. See *Sismondi* (vol. x. pp. 530–533), and Kitchin's *History of France* (vol. ii. Lond. 1877).

Jactitat'ion of Marriage is a suit which may be brought in the English Divorce Court. Its object is to compel any one averring that he or she is married to another, not admitting that it is so, to produce proof of the averment. If this is not done, decree passes ordering the claimant to keep perpetual silence on the subject, and making future averment of no legal effect.

Jade. (Fr. *jade*, Ital. *giàda*), a term under which several mineral species allied in physical appearances and properties are included. They are silicates of lime, magnesia, soda, and alumina, one or other base being absent in some and predominating in others. The variety of J. known as nephrite is very highly esteemed in China for ornamental purposes, being carved in a most elaborate fashion by the Chinese. It varies in colour from a leek-green to a pale milky-white. It was also formerly much used in New Zealand for axe-heads and grotesque charms, the latter being greatly treasured by the Maoris.

Jaën (Arab. *Jejan*, later *Jayenu-l-harir*, 'J. of the Silk,' referring to its former silk industries), the picturesque capital of a province of the same name, Spain, on the Rio de J., a branch of the Guadalquivir, 50 miles N. of Granada and 65 W. of Cordova. It is the seat of a bishop, is girt with Moorish walls, and guarded by an old castle, has two cathedrals, fourteen convents, various hospitals, libraries, and art galleries, an institute and theatre, and beautiful promenades. Under the Moors in the 12th c. J. reached its greatest point of prosperity, and was encircled by no fewer than 500 silk-weaving villages. Pop. 22,938. To the E., in the valley of the Rio-Tercero, are the much-frequented mineral springs of Ivalacuz, with a temperature of 24° F.—The *province* is part of Andalusia (q. v.), and was formerly an independent kingdom of the Moors till its conquest by Ferdinand III. in 1234, when it was added to the kingdom of Castile. It lies in the basin of the Guadalquivir, and is fertile and rich in metals. Area, 5184 sq. miles; pop. (1870) 392,100.

Jafferabad', the chief town of the native state of the same name, in Kattywar, India, on the estuary of the small river Ranuy.—The *state* of J., or Jingira, lies partly in the Kattywar peninsula and partly on the coast S. of Bombay; the latter portion is commonly known as the Hubshi, from the Abyssinian origin of the ruling dynasty. Area, 324 sq. miles; pop. (1872) 71,996; revenue, £32,700. The administration has of late been much improved by direct British management. The Nawab of J., or Hubshi Sidi, is the descendant of the admiral of the Mohammedan fleet who resisted the Mahrattas in his island of Jingia. The first treaty with the British dates from 1733.

Jaffnapatam', a town in the N.E. corner of Ceylon, and on a small island of the same name, sometimes described as a peninsula. It was originally a Dutch settlement, of which it still bears traces. It has some trade in tobacco and the various products of the cocoa-nut palm. Estimated pop. 8000.

Jagell'o, or **Jagjell'o**, born in 1354, succeeded his father, Olgerd in 1381 as Grand-Duke of Lithuania. In 1386 he

received the crown of Poland as Vladislav II., being chosen by the Polish nation husband to Hedwig, daughter of Lewis the Great of Hungary, on condition of renouncing and abolishing paganism. He founded the bishopric of Wilna and the University of Cracow (hence called the 'Academy of J.'), gained a decisive victory at Tannenberg (1410) over the Teutonic knights, and died May 31, 1434. His two sons, Vladislav III. and Casimir IV., followed him in succession, and J. was thus the founder of the *Jagellon Dynasty*, which ruled Poland till the death of Sigismund in August 1572, and gave Hungary three kings, of which the two last were also kings of Bohemia. By the marriage of Sigismund II.'s sister, Catharina Jagellonika, with the Swedish king Johan III., was formed a female line of Jagellons in the House of Vasa, which gave Poland three kings.

Jä'gerndorf (Krnov), a frontier town of Austrian Silesia, on the Oppa, 39 miles N.E. of Olmütz. It is capital of the Duchy of J. belonging (since 1623) to the Lichtenstein princes, whose castle, Lobenstein, is here. It manufactures linens, woollens, paper, and machinery. Pop. (1869) 8121.

Jagg'ernaut. See JUGG'ERNAUT.

Jagg'ery, a variety of crude sugar obtained from the palm in India. The flowering shoot of the palm is bruised on three successive mornings, a thin slice is cut off on the four following mornings, and the juice which flows out is collected in an earthen dish tied to the stump. The juice, if boiled down at once, yields the brown sugar called J. From the juice the fermented liquor called *toddy* is prepared; and if toddy be distilled, a good spirit is obtained, which constitutes one variety of *arrack*. Twelve trees yield about six gallons of J. daily, on an average.

Jagheer' (*jagir*), a Persian word, signifying 'that which occupies a position,' is in common use throughout India for a grant of land by the Government, revenue free, either terminable or not with the life of the grantee, and sometimes subject to conditions. It closely corresponds to the fief of medieval Europe. The most celebrated of these grants in history are the J. granted to the East India Company by the Nabob of the Carnatic, which now forms the Madras district of Chingleput; and the J. given to Lord Clive for life by the Nabob of Bengal in 1759.

Jaguar' (*Leopardus*, or *Felis Onca*), a species of Felidæ, or Carnivorous Mammalia, closely allied to the leopard of the Old World, and inhabiting S. America. The name 'Ounce' is sometimes applied to this animal. The fur of the J. is spotted as in the leopard, the spots being rosette-shaped, and of larger size than those of the leopard, whilst each spot has a very prominent central black mark. The spinal region is marked with a very prominent row of black spots. The breast bears three black bars not found in the leopard, and the tail of the J. is shorter in proportion to the size of body than the leopard's. The J. may equal the tiger in size and in strength. It seldom seeks to encounter man, unless pressed by hunger, or when set at bay. Its food consists of monkeys and other quadrupeds, and being an expert climber, it is the terror of arboreal animals. The J. is taken in traps, and the skin is of considerable commercial value.

Jaguar.

Jahn, Johann, a Roman Catholic divine and biblical critic, was born 18th June 1750, at Taswitz in Moravia, and studied at Xnaim, Olmütz, and Bruck. After taking orders (1775) he for a time filled the pastoral office, but was called to be Professor of Oriental Languages and Biblical Hermeneutics in the Lyceum of Olmütz in 1784. In 1789 he became professor of the same subjects at the University of Vienna. Though his views were conservative compared with those of Protestant biblical scholars, the novelty of his opinions among Catholic teachers led to a vehement outcry. He was compelled to desist from teaching in 1806, and accepted a canonry. He died 16th August 1816. J.'s most valuable works, the *Einleitung in die Göttlichen Schriften des Alten Bundes* (1793, 2d ed. 1803), and the *Biblische Archæologie*, his best work (1797–1805), were ultimately put by the Church in the index of prohibited books. Save the *Enchiridion Hermeneuticæ* (1812) and the *Vaticinia Prophetarum de Jesu Messia* (1815), his other works were mainly grammatical, and illustrated the Hebrew, Chaldee, Syriac, and Arabic languages.

Jail Fever has had many other popular appellations, as *hospital fever*, *ship fever*, *camp fever*, but is known now to have been but a severe form of *Typhus Fever* (q. v.). J. F. is described as having spread in our courts of justice, giving rise to what was termed 'The Black Assize' (q. v.), the last of which happened at the sessions of the Old Bailey in 1756, when the lord mayor, two of the judges, and several eminent persons died, having been infected by the prisoners. By attention to sanitary arrangements, J. F. has been reduced to a minimum in our prisons.

Jains, or **Jain'as**, a religious sect in India, intermediate between the Hindus and the Buddhists. Their origin and history are among the unsettled questions of Oriental scholarship; but it seems probable that they arose during the decline of Buddhism about the 8th c. A.D. Both tradition and architectural remains show that they were once predominant over a great part of the peninsula. Their present headquarters are Rajputana and Gujerat; but individual members are scattered throughout India, and they take the lead everywhere in commerce and banking. They are especially numerous in Lower Bengal, and have settled permanently in the neighbourhood of Murshedabad. Their most celebrated place of worship and of pilgrimage is Parasnath Hill in Chota Nagpore.

The philosophy of the J. is a manifest adaptation of the Buddhist doctrine of *nirvana*, and their religious beliefs and ceremonies are largely borrowed from the same source. The characteristic objects of worship are the twenty-four Tirthankaras or Jinas, deified saints, from whom the name of the sect is derived. The J. deny the divine authority of the Vedas, and are most strict in their respect for animal life. They are divided into two great divisions—the Digambara, 'skyclad' or naked; and Svetambara or 'white robed.' See Lassen's *Indische Alterthumskunde*, vol. iv., Essays by Colebrooke and Wilson, and Translations by the Rev. J. Stevenson.

Jájpore' ('town of the shrine'), a town in the district of Cuttack, Bengal, British India, on the right bank of the Byturn river, 180 miles S.S.W. of Calcutta. Pop. (1872) 10,753. It was the capital of Orissa before the rise of Cuttack in the 11th c.; and it contains numerous temples and sculptures of the Sivite sect of Hindus, which have been defaced by the Mohammedans. A great religious fair is still held here. See Dr. W. Hunter's *Orissa* (Lond. 1872).

Jakutsk', chief town of a Russian district of the same name in E. Siberia, on the left bank of the Lena. It is the centre of the N. Siberian fur trade, and the headquarters of the Russo-American Fur Trade Company. A great fair is held here annually from 1st July to 1st August. Although not the most northerly, J. is reckoned the coldest town in the world; it suffers greatly from the scarcity of drinking-water, which is supplied by melting ice. Among the articles of traffic, which are mostly despatched to Okhotsk, are the skins of sables, foxes, bears, &c., mammoth, buffalo, and other tusks and bones brought from the Lena's mouth and from Liakovski island in New Siberia Archipelago. Pop. 6100.—The *district* of J. is the vast region not included in the Siberian governments, and to the N. of the Amur territory has an area of 1,517,061 sq. miles, and a pop. (1870) of 231,977, mostly Jakut, Tungus, and Jukagir nomads. It is traversed by several mountain ranges, and watered by the Lena, Kolyma, Indigirka, &c. The chief occupations are hunting, fishing, and the herding of sheep, horses, and reindeer.

Jal'ap, the dried tubers of the *Exogonium Purga* (Convolvulaceæ), imported from Mexico, constitutes officinal J. Commercial J. consists of irregular egg-like roots, dark brown in colour, furrowed and contorted. J. is heavy, tough, and horny; the fracture is resinous, of a pale brown or dingy-white colour. It has a faint odour, and is mawkish, with acrid aftertaste. The virtue of J. depends on a resin, which can be extracted by rectified spirit. The crude substance, *Resina Jalapæ* (*B.P.*), is black, brittle, and lustrous. From it, by the action of ether, a residue is got having the composition $C_{31}H_{50}O_{16}$ called *Convolvulin*. This body is a strong purgative.

Another body called *Jalapin* ($C_{34}H_{56}O_{16}$) is obtained from the *Ipomæa orizabensis*, a Mexican plant, which is frequently used to adulterate true J., and known as *fusiform* or *woody* J. Jalapin

differs from convolvulin by being soluble in ether. *Tampico J.* is the product of the Mexican plant *Ipomœa simulans.* This variety closely resembles true J., but is usually smaller, and more elongated. It is said also to be less powerful in its action. J. is named from the town of Jalapa, whence it was first brought to Europe in 1610.

Medicinal Properties of J.—J. is a brisk cathartic, producing copious watery discharges, and from its hydragogic powers it is specially useful in cases of dropsy. When administered by itself, it sometimes operates painfully, and is, therefore, usually combined with *bitartrate of potash* and *ginger*, in the form of *compound powder of J.* The pharmaceutical preparations are the *extract*, the *resin*, and the *tincture.* Jalapin is simply the resin decolorised by animal charcoal, and is less liable to irritate the bowels. Dose of the *powder*, 10 to 30 grains; of the *compound powder*, 20 to 60 grains; of the *resin* and of *jalapine*, 2 to 5 grains; of the *extract*, 5 to 15 grains, and of the *tincture*, ½ drm. to 2 drms.

Jala'pa, one of the two capitals of the State of Vera Cruz, Mexico, on the slopes of the Cordilleras, 6 miles N.W. of the port of Vera Cruz. It is 4500 feet above the sea, and enjoys one of the finest climates in the world, is the residence of the wealthy merchants of Vera Cruz, to which city a railway was all but completed in 1875. J. is the seat of a bishop, and has Government buildings, high-class schools, three newspapers, cotton and cigar factories, tanneries, potteries, &c. Pop. 15,000. J. was founded in the time of Cortes, and has played a prominent part in Mexican politics. It was occupied by American troops in 1847–48. See Rivera's *Historie de J.* (5 vols. 1870–71).

Jalun', a town in a district of the same name, N.W. Provinces, British India, 110 miles S.E. of Agra. Pop. (1872) 10,197. It is always liable to inundation, and is unhealthy.—The *district* of J., lies between the native state of Gwalior, the Jumna and the Betwo rivers. Area, 1553 sq. miles; pop. (1872) 404,447. The crops are millets, gram, wheat, cotton, and the *al* dye. The chief town is Urai, but Kalpi and Kuch are the centres of trade. In the Mutiny most of the European residents were murdered, and it was not till the month of September 1857 that Sir Hugh Rose was able to restore order, after many engagements.

Jamai'ca (the Carib *Xaymaca*, 'land of wood and water'), the most important British island in the W. Indies, is in the group of the Greater Antilles, and lies 90 miles S. of Cuba, in lat. 17° 40'–18° 30' N., and in long. 76° 15'–78° 25'. Area, 4193 sq. miles; pop. (1871) 506,154, of whom 13,101 were whites, 101,346 mulattoes, 391,707 blacks. The island has an extreme length from Morant Point in the E. to S. Negril Point in the W. of 150 miles, and a breadth from Portland Point in the S. to Point Galina in the N. of 50 miles. Its chief inlets are Kingston Harbour, Old Harbour, and Morant Bay in the S., but there are innumerable creeks and coves. It is traversed by the picturesque Blue Mountains (q. v.), which attain a height in one peak of 7150 feet, and are luxuriantly clad with forests of cedar, mahogany, bread-fruit, cotton, fustic, satin-wood, and palm trees, and with pimento groves. The range slopes gently to the N., but is rugged and precipitous to the S., and on both sides sends down innumerable torrents. Of the more considerable streams, the longest is the Black River, with a course of 30 miles, navigable by flat-bottomed boats and canoes. The lower and more level part of J. is in the S.E., and here are the principal sugar-plantations, and chief centres of population, as Kingston, Port Royal, and Spanish Town. The Pedro Plains and Savannah la Mer in the extreme W. are in great part covered with swamps. The climate of J. is hot and unhealthy along the shores and in the valleys, but at an elevation of 1500 feet it is delightful. In summer the thermometer occasionally rises to 100°, and in winter it sinks to 60°. Near Kingston Harbour the mean is 81° F.; at an altitude of 4000 feet it is 68°. Snow has never been observed even on the highest peaks, but heavy hail sometimes falls. The sea-breeze that prevails on the low coast is popularly known as the 'Doctor.' The rainy seasons, in April and May, and in September, October, and November, are preceded by an oppressive stagnation of atmosphere, and ushered in by thunderstorms and hurricanes. Earthquakes are not unfrequent; those of 1692 and 1780 were especially destructive. Besides yellow and bilious fever, the common diseases include typhus and cholera; an epidemic outbreak of cholera in 1850–52 carried off some 30,000 inhabitants. The soil is extremely fertile; coffee can be cultivated at a height of 5000 feet, while sugar, indigo, and tobacco flourish in the plains and valleys. Other productions are arrowroot, ginger, turmeric, cacao, maize, yams, casava and sweet potatoes; the fruits are singularly abundant, including the pine-apple, pomegranate, orange, shaddock, fig, sweet-lemon, citron, mango, banana, &c. Of the animals, the more notable are the agoutis, iguanas, and various species of monkeys; alligators are numerous, and also parrots, humming-birds, mosquitos, &c. Fish abound in the sea and rivers, and swarms of rats destroy about a twentieth of the sugar-canes. Domestic animals have long been successfully introduced from Europe. The emancipation of the slaves in 1834 was followed by a falling off in the staple products of the island—sugar, rum, and coffee; but it is only fair to mention that this falling off had begun as early as 1820, or even earlier. Since 1865 trade has been gradually reviving, but the rich resources of the island are as yet far from being fully developed. The total value of the exports in 1874 amounted to £1,442,081, that of the imports to £1,762,817 (the largest sum since 1859). Of the exports, the chief articles were sugar, 28,398 hogsheads (value £482,779); coffee, 10,351,570 lbs. (£338,165); rum, 29,378 gallons (£293,878); logwood, 62,803 tons (£147,564); pimento, 5,761,273 lbs. (£36,008); and ginger, 1,181,789 lbs. (£21,103). The imports are mainly provisions, coal, and manufactured goods. The total tonnage of vessels entering and clearing in 1874 (exclusive of coasting trade) was 806,526. J., to which are annexed for administrative purposes the Turks and Caicos Islands, by Act of Parliament of 1873, is under a Governor-General appointed by the Crown, and an elective assembly. The Governor is the chief civil and military authority. In 1874 the public revenue was £536,799, and the expenditure £537,263, while the debt amounted to £665,537.

History.—Discovered by Columbus during his second voyage in 1494, J. received its first Spanish settlement in 1509. In fifty years the cruelty of the conquerors exterminated the native inhabitants. An English force, commissioned by Oliver Cromwell, and commanded by Penn and Venables, captured the island, which was ceded to England by the treaty of Madrid in 1670. The Maroons, the forsaken negro slaves of the Spaniards, defied the English for 140 years, but were subdued in 1795. The slaves were emancipated 1st August 1834. The immediate results of this noble act were unfavourable; hundreds of sugar and coffee estates were abandoned by the liberated slaves; planters associated to reduce wages and advance the rent of huts; negroes settled idly in the mountains, and an unsuccessful effort was made to introduce Chinese coolies. At last in 1865 the discontent of the negroes broke forth in a revolt, which was rigorously suppressed by Governor Eyre (q. v.). The negroes began with the massacre of twenty-three whites, but the island was promptly placed under martial law, about 1000 houses were burned, many rebels were hanged, and some flogged. The Governor was thanked by the Jamaica Assembly for suppressing the rebellion, but was recalled to England to answer charges of over-severity. Exonerated by a commission of inquiry, a vigorous but vain effort was made to bring him to trial by those who disapproved of his policy. The catastrophe of 1865 marks the beginning of a new life in the colony. Education is spreading among the blacks (grant to schools in 1866, £4622; in 1872, £19,403), poverty among them is disappearing, crime is diminishing, several of the long-forsaken sugar-estates have been taken up, and among other signs of improvement is the construction of new roads, harbours, and canals. See Michael Scott's *Tom Cringle*, Edward's *History of J.*, Stewart's *Past and Present State of J.*, Kingsley's *At Last*, and Trollope's *West Indies.*

Jamaica Bark. See CARIBEE BARK.

Jamb, in architecture, is the side of a window, door, &c.

James, the Elder, the son of Zebedee, was called with his brother John to be a disciple of Christ (Matt. iv. 21), and, along with his brother and Peter, of all the disciples, seems to have enjoyed the closest familiarity with his Lord (*cf.* Mark v. 37, ix. 2, xiv. 33). There is no further mention of him till he was beheaded by Herod Agrippa I. in the year 44 (Acts xii. 2). 2. J., the son of Alpheus, was one of the twelve apostles (Matt. x. 3). If Alpheus and Cleopas be, as some maintain, merely two

forms of the Aramaic name Chalpha, J. the Less (Mark xv. 40; John xix. 25) would be the same person; and if his mother Mary was the sister of the mother of Jesus, *i.e.*, unless there be four and not three women mentioned, John xix. 25, this J. was the first-cousin of Jesus. 3. J., the brother of Jesus (Matt. xiii. 55; Gal. i. 19), is doubtless the same as the J. of Acts xii. 17, &c. It is contended by some that he is the same as J. the Less (?), the son of Alpheus, on the ground that J., Joses, Simon, and Jude were not brothers, but first cousins of Jesus (see above). 4. J., the brother of Jude (Luke vi. 16; Acts i. 13; Jude i.), is probably the same as J. (3), whether the same as (2) or not. **The Epistle of J.** is variously supposed to have been written by or in the name either of J. (2) or (3), if these be different persons, and the time it was written variously fixed at from A.D. 45 to 68. According to chap. i., it was addressed to Jewish Christians out of Palestine. The main object of the epistle was to censure the errors connected with their Christian life, and to console them in adverse circumstances. The style is marked by great literary beauty; and the mode of thought is distinctly different from that of Paul or John. The critical literature on the epistle is very extensive, and has been reviewed by Professor Berschlag in *Studien und Kritiken* (1874). See also *The Catholic Epistle of St. James, a revised text with translation, introduction, and notes*, by F. T. Bassett, M.A. (Lond. 1877).

James I., son of Robert III., King of Scotland, was born at Dunfermline, 1391. It was resolved to send him to the court of France, Scotland's ancient ally, for protection and education, and he sailed in March 1409. The vessel was captured by an English ship of war, and the prince was carried a prisoner to London. On the death of his father in 1406, J. was acknowledged king by the Scottish Parliament; but no serious effort was made to effect his release and recall, and the government of the country remained in the hands of his uncle, the Duke of Albany. A romantic attachment, which forms the subject of the *Kingis Quhair* (King's Quire or Book), led to his marriage with Joan Beaufort, niece of Henry IV. of England, and having arranged a seven years' truce with England, he set out for Scotland, and was crowned at Scone, 21st May 1424. The young king devoted himself to the revision of old and the enactment of new laws, to the general survey and valuation of all landed property, the repression of mendicancy, the regulation of weights and measures, and the assimilation of the Scots Parliament to that of England. Eight months after his restoration he suddenly arrested twenty-nine of the leading nobles who were supposed to have been instrumental in keeping him so long from his rightful inheritance. Of these, the Duke of Albany and his two sons were executed on the 'heading hill,' Stirling, and a younger son was hunted, taken, and executed. J. broke the almost independent power of Donald of the Isles. In 1434 his daughter was sent to France, where eventually she was married to the Dauphin, afterwards Louis XI. The reforms introduced by J. promoted the wealth and the civil liberty of the humbler classes, and in proportion checked the hitherto unbridled powers of the feudal aristocracy; while the forfeiture of the estates of the Earl of March and of the Earl of Strathearn spread the greatest discontent and alarm among a number of the smaller barons. Sir Robert Graham, a kinsman of the Earl of Strathearn, having accused the king in Parliament of encroachments on the territorial aristocracy, was subsequently driven to seek refuge among the Highlanders north of the Tay. In the winter of 1436–37, J. was passing his Christmas at the monastery of the Black Friars in Perth, when, on the night of the 20th February, Graham with three hundred Highland cutlaws burst in upon him and despatched him in a vault in which he had sought to conceal himself. Besides his *Kingis Quhair* (printed in 1783 and edited by William Tytler, Lord Woodhouselee), which is in the allegorical style of the age, but is illumined by a pure, airy fancy, J. is accredited with the authorship of *Christis Kirk of the Grene* and *Peblis to the Play*. If this popular belief could be established, J. would rank in the history of Scottish literature as the first of those graphic humourists who have sought the sources of their inspiration in the pastimes and pleasures of humble life, and as the originator not only of the ornate and courtly poesy of Scotland, but of that vivid and joyous realism which attained its perfection in the verse of Burns.—**James II.**, born in 1430, was crowned at Holyrood in 1437. Sir Robert Graham and his confederates in the assassination of James I., were captured, and tortured to death at Stirling and Edinburgh. The two most ambitious and crafty men of the time were Sir William Crichton, governor of Edinburgh Castle, and Sir Alexander Livingstone, governor of Stirling Castle. The former endeavouring to obtain the undivided control of the infant king, the queen-mother fled with the boy to Livingstone, who, repeating Crichton's tactics, began as guardian of the king to exercise the prerogatives of royalty. Crichton seized the king as he was taking exercise in the park, hurried him off to Edinburgh, and once more found himself able to dictate to almost all the Scottish nobility. At this period (1439) the great house of Douglas was represented by a proud and extravagant youth of seventeen, who affected the state and grandeur of royalty. Crichton invited Douglas to visit the king in Edinburgh Castle; the Earl came accompanied by his brother, and both were beheaded (see DOUGLAS, FAMILY OF). Their cousin William married the sister of the murdered youths, and thus reunited the whole of the Douglas dominions. He sought still further to increase his influence by entering into a bond or agreement with two great noblemen, the Earls of Crauford and Ross, to support each other against all enemies. A paction of this description threatened the very existence of the Stuart dynasty, and in 1452 the king invited Douglas to Stirling with the object of persuading him to break the bond. This the Earl refused to do, and the discussion becoming impassioned, the king stabbed Douglas, who was afterwards despatched by the royal attendants. Civil war now burst forth between the royal forces and those of the Douglas family, but the contest was eventually closed by the forfeiture (1454) of the Douglas estates, the greater part of which passed to the Earl of Angus. England was now being desolated by the Wars of the Roses, and J. made an effort to recover Berwick and the castle of Roxburgh. The royal army, supported by a force under the Lord of the Isles, laid siege to Roxburgh Castle. Here for the first time the Scots troops employed artillery. By the accidental bursting of a cannon, the king was killed on the spot, 3d August 1460.—**James III.**, King of Scotland, son of James II., was born June 1452. From 1460 to 1465 the government of the country and the care of the king were vested in Kennedy, Bishop of St. Andrews, but on the 9th July 1466 the young king was kidnapped at Linlithgow and the prerogatives of viceroyalty assumed by the Boyd family, one of whom, Thomas, the eldest son, married the king's sister, the Princess Mary, and was created Earl of Arran. In 1467 J. was betrothed to Margaret, daughter of Christian, King of Norway and Denmark, who offered the Orkney and Shetland Islands as security for his daughter's dowry. The marriage was celebrated in July 1469, and the pledged islands being forfeited, were acquired by the Scottish crown. The fall of the Boyd family, after a parliamentary trial for high treason, occurred during the same year. Lord Boyd was obliged to flee to England, Alexander his brother was executed for treason, and Arran was divorced from the king's sister. The Lord of the Isles submitted to the king and yielded up the earldom of Ross and other lands. As a compensation he was created a Scottish peer, and was presented with considerable lands in central Scotland. In 1471 the bishopric of St. Andrews was created an archiepiscopal or metropolitan see. The king, himself an amateur in the arts and a recluse, chose to heap his favours upon artificers. His two brothers, the Duke of Albany and the Earl of Mar, he regarded with jealousy and treated as his enemies. Mar died suspiciously at Craigmillar Castle. Albany, forced to flee to France, was invited to England by King Edward, and signed a treaty with that monarch by which he was enfeoffed—on parchment—with the Scottish sovereignty. Meantime (1482), believing that England threatened war, J. assembled a great army on the Boroughmuir and marched toward the Border. On this expedition the king's chief favourite, Cochrane, a 'mason,' or architect, was intrusted with an important command. Enraged at this fresh instance of the king's infatuation, the leaders of the Scottish army, which had now advanced as far S. as Lauder, seized several of the favourites, Cochrane, Rogers a musician, Torphichen a fencing-master, Hommel a tailor, and Leonard a shoemaker, and hanged them over Lauder Bridge. In 1488 a widespread confederacy organised for the purpose of dethroning the king drew to a head. The royal army and that of the confederates, with the king's eldest son at their head, met at Sauchie Burn, between Bannockburn and Stirling, where a skirmish took place, 18th June

1488. The unwarlike king was seized with panic, and in his headlong retreat was thrown from his horse, and afterwards killed 'of mischance.'—**James IV.**, son of the preceding, born 17th March 1471, ascended the throne on the death of James III., in 1488. In 1495 he received Perkin Warbeck, the pretended rightful heir to the throne of England, with splendid hospitality, gave him Lady Catherine Gordon, granddaughter of James I., in marriage, and fitted out expeditions in 1496 and 1497 to accompany the Pretender into England. On the 8th August 1502, he married Margaret, Princess of England. After the death of Henry VII. of England, in 1509, difficulties, arising originally from quarrels and reprisals at sea, occurred between the two countries. Other causes of quarrel were the withholding, on the part of Henry VIII., of the jewels and treasure which James's queen should have inherited on the death of her father, Henry VII., and the existing alliance between Scotland and France. James assembled an army, and, marching south, fought and lost the disastrous battle of Flodden (q. v.), in which he and the flower of the Scottish nobility of that day perished, 9th September 1513.—**James V.**, son of the preceding, was born 10th April 1512. In 1514, the queen, his mother, married the Earl of Angus, but the Parliament, alarmed at the increased power of the Douglasses, intrusted the government of the country to the Duke of Albany, who was summoned from France to assume the office of Regent. In 1524, disgusted with the severe unyielding temper of the contending parties in Scotland, Albany finally returned to France. In August of the same year J. assumed the royal functions under the advice of the queen and the Lords of Council. The Earl of Angus, who had been living for some time at the English court, and had been won over to the interests of Henry VIII., returned to Scotland in 1525. In 1526 the king ceased to be a minor, and chose as his guardians the Earl of Angus and the Lords Argyle and Errol. Angus kept the boy-king a close prisoner, and allying himself with the Earl of Arran, commenced to rule with despotic authority. In May 1528, the king, then residing at Falkland, succeeded in making his escape, and riding to Stirling, found refuge in the castle. The estates of Angus were forfeited, and the Earl fled to England in 1528. But the house of Douglas, of which he was the head, had still many adherents. In 1531 James marched to the borders, and put to death many of the chiefs, including John Armstrong and his brother Thomas, who, after being invited to a conference, were seized, convicted of theft, and hanged. The king then marched with an army to suppress disturbances in the Highlands and Islands, the result of the expedition being that Argyle, Lieutenant of the W., and Craufurd, Lieutenant of the N., were deprived of their office and local influence. This was only one of a persistent series of measures for curbing the power of the great aristocratic houses. Disaffection spread among a number of the barons, and in 1532 Scotland was invaded by an English force under Northumberland, in which the Earl of Angus and several of his apostate kinsmen fought. A border war raged between the two countries till the peace of 1534. J. married Magdalen, daughter of the king of France, in 1537; but she dying a few months afterwards, he espoused Marie, widow of the Duc de Longueville, and daughter of the Duc de Guise, in 1538. Provoked by J.'s refusal to be a party to a conference on ecclesiastical matters, Henry VIII. sent an invading force across the border in 1542. A Scottish army opposed the invaders, but refused to pursue them over the border. Unseemly discussion and disorder prevailed in J.'s camp, and a body of 300 English cavalry taking advantage of the confusion, charged the Scots, and completely routed them. J., broken in body by an intemperate mode of life, sank under the dishonour of this defeat, and died at Falkland Palace, December 13, 1542. For the fuller history of the first five Jameses see the Histories of Tytler and Hill Burton.—**James VI.** of Scotland and **I.** of England, the son of Mary Queen of Scots, by her second husband, Henry Stewart, Lord Darnley, was born at Edinburgh, 19th June 1566. In the following year Mary was forced by the insurgent nobles to resign the crown to the infant J. who was proclaimed king on 29th July. In 1570 J. was placed under the tutorship of the famous George Buchanan (q. v.). During the stormy years of his childhood, passed at Stirling Castle, the regency was successively in the hands of the Earls Murray, Lennox, Mar, and Morton, until on the overthrow of the last J. placed himself at the head of the Government in 1578. For some years, however, he remained under the influence and control of the Duke of Lennox (Esmè Stewart) and the Earl of Arran. At the 'Raid of Ruthven,' 22d August 1581, the king was kidnapped by the confederate lords, who held him in custody for ten months. On the 23d November 1589 he married the Princess Anne of Denmark. Ignoble disturbances organised by the 'Popish lords,' chiefly Bothwell and Huntly, and fierce debates between the king's 'Commission of Finance,' and the zealots of the kirk, occupied the rival parties of the country from 1592 to 1597. The singular 'Gowrie Conspiracy' (q. v.) took place in 1600. In 1603 James succeeded to the English throne, and was crowned at Westminster, July 25. The Gunpowder Plot (q. v.), a Catholic conspiracy to destroy the king and Parliament, was discovered in 1605. The king's ungainly appearance, his undignified bearing, and the recklessness with which he lavished wealth and honour on unworthy favourites, rendered him unpopular with an influential section of the English nobility. Such was his coarse extravagance that after a few years of peace he had doubled the amount of the debt that had been contracted by Elizabeth after fifteen years of war. His first expedient for raising supplies was the arbitrary imposition of taxes on the imports and exports of the country; and as the commerce of the country was now rapidly extending, the experiment was found, for a time, to answer. The Commons (in 1610, and again in 1614) remonstrated against these imposts as illegal, and supplies were refused until illegal taxation and other grievances were redressed. James dissolved both Parliaments. Misled by his theory of the divine right and absolute authority of kings, he now resolved to govern without any Parliament. He continued to levy customs, to issue letters to the landholders demanding 'benevolences' or loans, to sell peerages, and to openly interfere with the natural course of justice. James's foreign policy was as disastrous as his home measures were illegal, profligate, and mean. He proclaimed an alliance with Spain, on the eve of a great struggle on the Continent between Protestantism and Catholicism, and to this suicidal alliance the life of Sir Walter Raleigh (q. v.) was among the first of the many sacrifices paid. J. died 27th March 1625. In Henri IV.'s phrase, he was 'the wisest fool in Christendom.' Despicable as were his personal qualities, he was 'a ripe scholar, with a considerable fund of shrewdness, of mother wit, and ready repartee.' He was widely read, especially in theological matters, and among his voluminous writings are *Essays of a Prentice in the Divine Art of Poesy* (Edinb. 1584); *Dæmonologie* (1597); *True Law of Free Monarchies* (1598); *Basilikon Doron* (1599); *Triplici Nodo Triplex Cuneus* (1605); *Remonstrance for the Right of Kings* (1615); and *Counterblast to Tobacco* (1616). These works are full of 'canny humour,' and abound with 'quaint, incisive phrases, with puns and epigrams, and touches of irony which still retain their flavour,' but have now mainly an historical interest. See Nichol's *Progresses, Processions, and Festivities of J. I.* (3 vols. Lond. 1829); D'Israeli, *Inquiry into the Literary and Political Character of J. I.* (Lond. 1816); Gardner, *History of England from the Accession of J. I.* (Lond. 1875); and various authorities given in Green's *Short History of the English People* (1875).—**James II.** of England and **VII.** of Scotland, brother of Charles II., was born in London, 15th October 1633. He became Duke of York, escaped from the Parliamentarians, and sought refuge in the Low Countries in 1648; served with distinction under Turenne and Condé, and was made Captain-General in Italy by Mazarin in 1656. In 1660 he was appointed Lord High Admiral of England and Lord Warden of the Cinque Ports, and married Anne, daughter of Lord Chancellor Hyde; after whose death he married Maria Beatrice, daughter of the Duke of Modena, in 1673. He avowed himself a Catholic in 1671; and though a bill excluding him on account of his religion from succession to the crown had passed in the Lower House in 1680, he ascended the throne without opposition on the death of his brother, February 6, 1685. His first public act was to pledge himself to preserve the laws inviolate and to protect the Church; and Parliament enthusiastically voted him a revenue of nearly two millions for life. Two risings took place in 1685—one in the W. under the Duke of Monmouth, who by many was believed to be the legitimate son of Charles II., and therefore the true heir to the throne, and the other a Protestant movement in the N., under the Earl of Argyle. The latter rising was soon suppressed and its leader beheaded; the former collapsed on Sedgemoor (q. v.), where Monmouth (q. v.) was put to flight, to be captured a few days afterwards, and

remorselessly sent to the block. The rebels were hunted down, burned, hanged, whipped, and sold into slavery with a ferocity that filled the land with horror, and earned for Judge Jeffreys (q. v.), who presided over the 'Bloody Assize,' a reputation for cruelty unsurpassed in the annals of any age or country. In 1686, James abolished the Test Act, revoked the laws forbidding Catholic priests to conduct worship publicly according to the Catholic form, refilled the streets of London with monks and friars in their religious garb, endeavoured to convert Oxford and Cambridge into Catholic seminaries, and appointed Catholics to many of the chief offices in Church, state, and army. In 1687 he issued the famous 'Declaration of Indulgence,' which formally abrogated all tests as qualifications for religious or civil appointments, and re-issued it on the 27th April 1688 with the command that it should be read in all the churches. Archbishop Sancroft and his six suffragan bishops protested against publishing what they deemed an illegal document. The seven churchmen were committed to the Tower and brought to trial on the 29th June. Their acquittal was the result of the overwhelming force of public sympathy and indignation. The country was now in revolution; William of Orange arrived in England, on the invitation of a number of the leading nobles and statesmen, on the 5th November 1688, and J. flying from the country to France, was received and pensioned by Louis XIV. The defeat of the battle of the Boyne (q. v.) ruined all J.'s hopes of conquering England from Ireland, and retiring to St. Germains, he died there, 6th September 1701. See Clarke's *Life of J. II.* (2 vols. Lond. 1816); the *Life* in Macpherson's *Original Papers*; and M. Mignet's *Négociations Relatives à la Succession d'Espagne* (Par. 1835), which is indispensable for a real knowledge of this and the preceding period; also Macaulay's *History of England.*

James, George Payne Rainsford, a voluminous writer of historical romances, was born in London in 1801. He published his first novel, *Richelieu*, in 1828, his second, *Darnley*, in 1830, and subsequently about a hundred works of the same kind. His romances bear a strong family resemblance, and are somewhat puerile in conception, but are agreeable, and even skilful narratives. *De Lorme, Mary of Burgundy*, and others are still widely read. He also wrote histories of various French and English princes, and was made historiographer-royal by William IV. In 1850 he was appointed consul at Massachusetts, and in 1858 at Venice, where he died, June 9, 1860.

James, John Angell, a popular Evangelical writer, was born June 6, 1785. From the age of twenty till his death (October 1, 1859) he was pastor of Carr's Lane Congregational Chapel, Birmingham. He was an eloquent and imaginative preacher. Many of his writings have attained extraordinary popularity, *The Anxious Inquirer, Christian Father's Present to his Children*, &c., having sold by hundreds of thousands. See his *Life and Letters* by R. W. Dale (1861).

James River, a river of the United States, rises about the centre of, and is entirely within, the State of Virginia. It cuts through the Blue Ridge, and has a course generally E.S.E., passing Lynchburgh and Richmond, widening into a splendid estuary 66 miles long, and entering Chesapeake Bay by Hampton Roads, the best harbour on the Atlantic coast. The J. R. is 450 miles long, and is navigable as far as Richmond for steamers and schooners of 130 tons. By an extension of the J. R. and Kanawha Canal it is proposed to connect the Ohio River and the above at a cost of sixty million dollars. See *Annual Report of the U. S. Chief of Engineers* (1874).

Jameson, George, a Scottish portrait-painter, was born (1586) at Aberdeen, and settled about 1620 in his native town. Walpole has called him 'the Vandyck of Scotland,' and it is said that he studied with Vandyck under Rubens. Charles I. sat to J. in 1633, and he was largely employed by the Scotch nobility. At Taymouth Castle, in the colleges of the University of Aberdeen and in the Advocates' Library, are specimens of his work. J.'s portraits want the sense of movement and the gradations of light and shade visible in the Dutch masters; his heads are painted on a dark ground, and upon them the most of his work is concentrated. He died at Edinburgh in 1644. 'It must be admitted,' says Mr. J. H. Burton, 'that the claims to immortality of this one Scots painter are founded somewhat on the poverty of neighbours.'

Jameson, Mrs. Anna, authoress and art critic, was born in Dublin, 19th May 1797. Her first works were notes of travel and lives of celebrated females. *Characteristics of Women* (1832) is a fine analysis of Shakespeare's heroines. She commenced art criticism in 1842 with a *Handbook to Public Galleries of Art in London*, and was an industrious expounder of art till the close of her life, publishing many valuable volumes, illustrated by beautiful etchings. The most important of these are *Sacred and Legendary Art* (2 vols. 1848), and the *History of Our Lord as exemplified in Works of Art* (1860), continued by Lady Eastlake, and completed in 1864. Mrs J. died March 17, 1860. See Miss Macpherson's *Memoirs of the Life of Anna J.* (Lond. 1878).

James's Bay, a large inlet in the S. of Hudson's Bay, in lat. 51°-55° N. and long. 79°-82° 30′ W. It receives the rivers Albany, Moose, Rupert, and E. Maine, abounds in shoals and islands, and along its S. shores are extensive marshes. It was named from Captain James, who wintered here in 1631-32.

James's Palace, St., an irregular brick building south of Pall Mall, originally a hospital, enlarged and partly rebuilt by Henry VIII. It was the royal residence from the burning of Whitehall till the opening of Buckingham Palace. Till 1861 drawing rooms were held here, and it is still used for levees. *St. James' Park*, 91 acres in extent, lies S. to the rear of the palace. The fine avenues, broad walks, and ponds were planned under Charles I. The picturesqueness of the gardens is enhanced by the surrounding palaces, Government offices, and other fine buildings.

James's Powder is a patent medicine introduced by Dr. Robert James, who died in 1776. From the analysis of the medicine it appears to consist mainly of *antimonious acid, phosphate of lime*, and *oxide of antimony*, the two former making up the bulk of the medicine. The pharmacopœial preparation, *pulvis antimonialis* contains one part of *oxide of antimony* and two of precipitated *phosphate of lime.* J. P. is prescribed as a sudorific in fevers and rheumatic affections, in doses of from 2 to 6 grains.

Jamestown (1) a post-village of New York, U.S., on the outlet of Chautauqua Lake, 50 miles W. of Buffalo, and 2½ miles from the Pittsburg Railway. It has ten churches, two newspapers, extensive manufactures of alpaca and woollens, &c. Pop. (1870) 5336. (2) A township of Virginia, the first permanent English settlement in America. It lies on a peninsula 32 miles from the mouth of the James River, and has a pop. of 1088. Settled originally by a band of 107 colonists under Wingfield, Christopher Newport, and Bartholomew Gosnold, April 26, 1607, and named after James I., it soon became the capital of a thriving colony; and in 1619 a House of Burgesses, the first legislative assembly in British America, met here. J. began to decline after the seat of government was removed to Williamsburg, was in part burned during the rebellion of 1676, and was the scene of an engagement between Wayne and Lord Cornwallis in 1781.

Jamieson, Rev. John, was born in Glasgow, March 3, 1759, attended lectures at the University of his native place in his tenth year, and afterwards at Edinburgh; was licensed to preach, 1779; ordained pastor at Forfar, 1781; and transferred to Edinburgh, 1797. After publishing some poems, sermons, and theological works, he issued an *Etymological Dictionary of the Scottish Language* (1808-9), an *Abridgment* (in 1818), and a *Supplement* (in 1825). This work is chiefly important as a record of pure Scotch before it had ceased to be spoken among the educated classes. His philological theory of the origin of Lowland Scotch is utterly worthless, but the value of the work as a treasury of the peculiar forms of Northern English used in Scotland is not impaired by its perverse etymologies. J. published *An Historical Account of the Ancient Culdees of Iona, and of their Settlement in Scotland, England, and Ireland* (1811), *Hermes Scythicus* (1814), besides editing Barbour and Blind Harry with due credulity. He died at Edinburgh, July 12, 1838.

Jamieson, Robert, a Scottish naturalist, was born at Leith, July 11, 1774. He studied medicine at Edinburgh University, but ultimately directed his whole attention to natural history. In 1800 he went to Freyberg and worked under Werner, and in 1804 was elected Professor of Natural History at Edinburgh. In 1819, along with Brewster, he started the *Edinburgh Philosophical Journal*, and in 1826 founded the *New Philo-*

sophical Journal, which he edited till his death on April 10, 1857. J.'s chief works are *A System of Mineralogy* (1804, 3d ed. 1823), the *Elements of Geognosy* (1809), *Manual of Minerals*, &c. (1821), and the *Elements of Mineralogy* (1837).

Janes'ville, a city of Wisconsin, U.S., on both sides of Rock River, 70 miles W.S.W. of Milwaukee by rail. Among its industrial establishments are a large reaper-factory and machine-shops, and there are extensive manufactures of boots and shoes, carriages, &c. The State institute for the blind is at J., also excellent musical schools. Pop. (1870) 8789.

Jan'in, Jules Gabriel, a French novelist and critic, was born at St. Etienne, 24th December 1804, educated at the college of Louis-le-Grand in Paris, and began a literary career by writing political satires in *Figaro* and *Messager des Chambres.* In 1829 appeared his first novel, *L'Ane Mort et la jeune Femme Guillotinée*, a sensational satire on Victor Hugo as a pioneer of Romanticism. At intervals there followed *Barnave*, *Contes Fantastiques*, *Contes Nouveaux*, *Voyage de Victor Ogier*, *Les Catacombes*, *Les Symphonies de l'Hiver*, sketches to the *Revue de Paris*, &c. But his most characteristic works were the *feuilletons* of the *Journal des Debats*, begun in 1833 and continued till his death. Steeped in classical literature, with a style full of brightness and charm in its aerial movement from one impalpable idea to another, light, free, and sparkling, J. discoursed to the Parisians with immense acceptance, earning for himself the title of *le Prince de la Critique.* In 1870 he was elected a member of the Academy, and died 20th June 1874. See M. Piedagnel's *Jules Janin* (Par. 1876), and *Correspondance de J. J.* (Par. 1878).

Ján'ina (Slav. 'St. John's town;' in Turk. *Yânya*), the capital of a vilayet of the same name, in the S.W. of Turkey, on the W. side of Lake J. (anc. *Pambotis*). It has sixteen mosques, eight Greek churches, two Greek colleges, and two synagogues. The Pasha resides in a fort surrounded by a ditch. J. still manufactures a considerable amount of gold-stuffs, silks, morocco-leather, coloured linen, &c. The artisans are mostly Greeks. Pop. 30,000. Ali Pasha (q. v.) usurped the pashalic of J. in 1807 and held it till 1820, during which time order was firmly restored and the pop. of the capital rose to 50,000. The Lake of J. is 12 miles long and 3 broad, and at its S. end stood the ancient Dodona with its famous temple.

Jan'issaries ('new soldiers'), were a well-disciplined body of Turkish infantry, originally composed of a tribute of children taken from Christian subjects by Orkhan (1330) and Amurath I. (1362). After special privileges were granted to them, Turks joined their ranks, and they were divided into regular and irregular troops. They acted both as police and members of the Sultan's bodyguard, but their power became in time so dangerous and their initiative in insurrection so frequent, that they were dissolved with great slaughter by Sultan Mahmoud II. in 1826.

Jan Mayen's Land, an island in the Arctic Ocean between Iceland and Spitzbergen, in lat. 70° 29′ N., and long. 7° 31′ W. It is volcanic, and its highest points, Beerenberberg (6640 feet) and Esk (1500), are still occasionally active. It is named after a Dutchman who discovered it in 1611.

Jan of Leyden (properly **Jan Bockelson** or **Bockold**), born at Leyden about 1510, was a tailor in his native town, where he also kept an inn, amusing his guests with his poetry and acting. Making the acquaintance of Jan Mathison of Haarlem, a baker, in 1553, he accompanied him to Münster, where he soon became the chief of the Anabaptists. After his friend's death in 1534, B. was proclaimed king of 'the new Zion,' and gave himself out as a prophet. In order to marry Mathison's widow he introduced polygamy, and had at last seventeen wives. He lived with great magnificence, and practised the utmost cruelty. Considering himself the founder of the millennium, this madman sent out twenty-eight apostles, and appointed twelve 'dukes' to rule the world under him. The town was long besieged in vain by the Bishop of Münster, but was taken (24th June 1535) after a valiant defence; B. was seized with his ministers Knipperdolling and Krechting, and put to death, 23d January 1536.

Jan'sen, Cornelius, a famous Catholic divine, was born, 28th October 1585, at the village of Akoi in N. Holland, studied at Utrecht and Louvain, and after a residence in Paris and Bayonne returned to Louvain, where he passed as doctor in 1617, and became professor in 1630. In 1635 he became Bishop of Ypres. A zealous student of the great Latin fathers, he taught Augustine's theology on the fall, original sin, grace, and predestination, and at his death, 6th May 1638, left as his testament to posterity his *Augustinus seu Doctrina Augustini de Humanæ Naturæ Sanitate, Ægritudine, Medicina, adversus Pelagianos et Massilienses*, published at Louvain in 1640, at Paris in 1641, and at Rouen in 1643.

Jansenism was the name by which the doctrinal system of J. became famous after his death. As early as 1641 the Jesuits disputed publicly against his views, but defenders were found amongst Benedictines, Augustinians, priests of the Oratory, and part of the Dominicans, the hereditary enemies of the Jesuits. Soon the controversy spread over all ranks; even court circles took sides. J.'s views were most brilliantly supported by such scholars as Arnauld, Nicole, and Pascal; the monastery of Port Royal was the recognised hearth of Jansenism. In 1642 the *Augustinus* was condemned as heretical by the bull *In eminenti.* But steady opposition to this was offered by many bishops and universities. In 1653 four selected propositions from J.'s work were formally pronounced heretical by Innocent X. The controversy grew hotter on both sides till in 1668 a temporary truce was obtained, the bishops admitting that the propositions condemned were heretical, but declining to admit that they were Jansenists. The bigoted Louis XIV. would hear of no concession to Jansenism, and by persecution forced many Jansenists to flee into the Netherlands. The next important step of the controversy was the publication of a French New Testament by Quesnel, with a commentary, in a Jansenistic spirit. This it was which in 1713 drew from Rome the famous constitution *Unigenitus*, in which 101 propositions from Quesnel's Testament, including not a few doctrines taught by the most approved fathers of the Church, and even some distinctly Tridentine assertions were summarily declared heretical and dangerous. The community of Port Royal were expelled and their buildings destroyed. The constitution provoked fierce hostility in France. A large party of the French clergy protested against the bull, declining to accept it save with modifications. And when the Pope threatened excommunication, they appealed to a general council of the Church. The *appellants* were headed by four bishops, and joined by many who were not themselves Jansenists, including Cardinal Noailles. Even when in 1719 excommunication was finally fulminated against the appellants, the Parliament of Paris, the Sorbonne, and other theological faculties remained steadfast. But the papal policy triumphed at last; Noailles and the most distinguished of the appellants were found amongst the *Acceptants.* Appellants and Jansenists were now no longer tolerated in France; again there was an exodus to Holland; and though the spirit of Jansenism still lived in the French clergy, what was latterly associated with the name of Jansenism was a wild superstition cherished chiefly amongst the uneducated. François of Paris, a noted appellant, died steadfast to his testimony. His grave was visited by multitudes, and miracles of healing were reported thence. The alleged miracles were seriously investigated even by such Protestant theologians as Mosheim, and were made use of by Hume in his famous *Essay on Miracles* The community of refugee Jansenists, calling themselves officially 'disciples of St. Augustine,' have since 1723 had an Archbishop of Utrecht and the Bishops of Haarlem and Deventer to preside over them. They profess still to belong to the Catholic Church, and recognise the Pope as visible head of the Church. They have about twenty congregations, over 5000 members, and from them the Old Catholics of Germany have had a measure of sympathy and help.

Jan'ssens, Abraham, a Flemish painter, born at Antwerp about 1569, died 1631, was a pupil of Jan Snellinck and a contemporary of Rubens. Many historical pictures by J. may be found in the Flemish churches, and there are some in Dresden, Munich, Vienna, and Berlin. His torchlight scenes are specially famous.—**Cornelis J.**, a Flemish portrait-painter, whose historical pictures are also admired, died at Amsterdam in 1665.—**Victor Honorius J.**, a Flemish historical painter, born at Brussels in 1664, died in 1739. He formed his style by the study of Albani in Italy.

Janua'rius, Order of St., an order of knighthood founded 6th July 1738 by Charles III. of Spain (then King of Sicily),

abolished in 1806, but renewed in 1814. An octagonal gold cross in white and red, adorned with lilies of gold, with an image of St. Januarius bearing an open book on the obverse, and an open book and the two phials of the legend; on the reverse is the badge of the order, which comprehends *Cavalieri di Grazia*, and a higher class called *Cavalieri di Giustizia*, who must be of a house ennobled at least four generations.

Januarius, St. (San Gennaro), Bishop of Beneventum in Campania, was beheaded under the Emperor Diocletian about the beginning of the 4th c. His body was brought to Naples by Bishop St. Severus, in the time of Constantine, and deposited in the cathedral, which is dedicated to St. J., the patron saint of Naples. His head, with two phials (*ampullæ*) said to contain his blood, is preserved in a separate chapel, and it is affirmed that the blood usually becomes liquid when brought near the head. The relics are exhibited thrice yearly, on the 19th September (anniversary of his death), the first Sunday in May, and 16th December, and these are the greatest festivals of Naples. The Romish Church recognises fourteen other martyrs named J.

Jan'uary, the first month of the year According to Roman legend, *Januarius* was the name given by Numa to the first of the two months added by him to the ten of Romulus to make a pure solar year, and was called after Janus, the beginner of all things, as being the month next after the winter solstice, when the sun resumes his journey (Ovid., *Fast.* i. 163). The consuls received office (from B.C. 153 at least) on the 1st of this month, which thereby became the 1st of the civil year. See YEAR.

Ja'nus, an Italian divinity of great antiquity. J. and Jana (the feminine form) were identical with Dianus and Diana, worshipped as the sun and moon. J. was represented as bearing a sceptre and key, and as having two faces, the one young and the other old, looking opposite ways, and seems to have been worshipped by the Italian tribes in the remotest times, but has no place in the Greek mythology. He was the god of beginning and entering; his name was mentioned first in prayers, and his festival fell on the first day of the month Januarius, on which occasion friends gave one another *strenæ* or gifts of sweetmeats and copper coins with the double head of J. on the obverse, and on the reverse a ship's prow, and offered to him incense, wine, barley, and cakes called *janual.* As opener of the day he was called *Matutinus Pater.* Close to the N.E. corner of the Roman Forum was the temple of J. built by Numa. But as there were in Rome other shrines of J., and all open archways were called *Jani*, this temple is not to be confounded with the *J. quadrifrons*, still extant, a massive double archway of Greek marble covered with bas-reliefs descriptive of a sacrifice. The Romans connected the word J. with *janua* (door). Max Müller (*Science of Language*, vol. ii. 452), comparing *Jan* (the older form of J.) with Greek *Zên* and Sanskrit *dyav-an*, adds, 'He was likewise called *Janonius* and *Quirinus*, and was, as far as we can judge, another personification of *Dyu*, the "sky," with special reference, however, to the year.'

Japan' (the native *Nipon* or *Dai Nipon*, *i.e.*, 'land of the rising sun'), an insular empire in the E. of Asia, comprising the four large islands of Nipon (the Japanese mainland), Sikok, Kiusiu, and Yesso, and as many as 3500 smaller ones, including the Kurile Islands. The large islands form a crescent extending in a direction N.N.E. from Corea to the Russian island of Saghalien, and thence the Kurile Islands stretch still further N.E. between the N. Pacific and the Sea of Okhotsk to the southern point of Kamtchatka. The large islands are washed on the E. by the N. Pacific, and on the W. by the Sea of J., and are separated in the S. from the Corea by a channel 500 miles wide. According to the official reports the total area is 156,604 sq. miles, and the pop. (1875) 32,794,897. By far the largest of the four principal islands is Nipon, which has an area of some 95,000 sq. miles, and gives name to the empire. Yesso, with an area of 30,000 sq. miles, lies N. of Nipon, and Sikok (10,000 sq. miles), and Kiusiu (16,000) lies to the S.W. The coast is in great part bold and rocky, and is indented with many deep bays, forming excellent harbours. The empire is divided into five *kies* or departments, which surround the imperial capital, and eight *dôs* or large districts, which are subdivided into seventy-two *kens* or provinces. The two principal cities are Miako, the ancient seat of government, and Yedo, the present capital.

Physical Aspect.—The principal islands are traversed by mountain ranges, which here and there attain a great elevation, and in which there are many volcanoes. The most extensive range is Hakoni in Nipon, and the highest summit in all J. is Fusiyama ('sacred mountain'), an extinct volcano, 80 miles S.W. of Yedo, with a height of 14,170 feet, and a perpetual cap of dazzling snow. The volcanic mountain of Wunsentake, on a western promontory of Kiusiu, also rises above the perpetual snow line. In Yesso the mountains near the coast are 8000 feet high, but a large part of the island is still unexplored. The islands of J. are strongly affected by volcanic actions, and are frequently visited by earthquakes, especially in the N.E. Though impetuous, the rivers are short and shallow; they are subject to numerous freshets during the rainy season, and the mouths of most of them are obstructed by sand-bars. The three chief rivers are the Torregawa, Sinanogawa, and Kisogawa. The only considerable freshwater lake is Biwako or Lake Umi in Nipon, near the city of Miako, and it is 40 miles long and 12 wide. Throughout the mainland there are many lakelets and hot springs. The village of Mionoska, with its sulphur springs, 65 miles S.W. of Yedo, and within the sacred precincts of Hakoni, is the Baden-Baden of the Japanese aristocracy.

Climate, Botany, and Agriculture.—The climate of J. varies greatly, but in the central part, which is the most densely populated, it is generally mild and agreeable. In the extreme S. the heat is often oppressive, while in Yesso the mercury sometimes sinks far below zero, the snow falling to a great depth in the valleys. The greatest heat of J. (96° F. in the shade) is less debilitating than that of the Indian or Chinese coast. The W. coast of Nipon is said to be much colder than the E., and this is attributed to a constant current setting S.W. from the Sea of Okhotsk. October and November are the finest months in the whole year; June, July, and August are those of the annual rains, which fall in long-continued, deluging showers. The sun is occasionally hidden by fogs for several days together. September brings the fearful typhoons, which cause such havoc along the E. coast of the empire. The flora of J. strikingly resembles that of N. America. The grandest forest trees are the evergreen oak, the maple, and sycamore. In Nipon and Yesso there are large forests of pine, chestnut, beech, elm, dwarf-oak, elder, cypress, &c. Peculiarities of Japanese flora are the camphor tree (*Laurus camphora*), the lacquer tree (*Rhus vernicifera*), the wax tree (*Rhus succedanea*), and the paper mulberry (*Brousonetia papyrifera*), the bark of which is converted into paper. In the S. grow bamboos, bananas, tree-ferns, the sago and other palms, and not less than 150 species of evergreen trees. Among the many flowering plants are the azalea, camellia, marigold, and water-lily. Fruits are abundant, comprising figs, lemons, oranges, apricots, peaches, plums, a species of citron, &c. The Japanese are good agriculturists, and pay great attention to irrigation, manures, and the rotation of crops. Their soil, a fertile, friable loam, is chiefly under tea and rice, but other products are cotton, tobacco, wheat, maize, millet, potatoes, turnips, beans and peas, carrots, melons, gourds, and cucumbers. European machinery is fast coming into common use.

Mineralogy.—The great mineral wealth of J. has been long known, an extensive export of copper, silver, and gold having been begun by the Dutch as early as 1545. Gold and silver are said to be richly distributed in the N. of Nipon, and in the N.E. of Nambu are the famous gold mines of Natsumai. Copper is the principal metal of J., and of the many kinds bar-copper is the most valuable. There are large iron-mines in Yesso, and the purest sulphur is found here and in the neighbouring islands in almost inexhaustible quantities. Lead as well as copper is wrought near Hakodadi, and rich beds of superior coal occur throughout the four large islands. Ambergris and pearls of fine quality are found along the shores. Among the other mineral products of J. are a reddish naphtha, agates, cornelians, jaspers, alum, talc, felspar, basalt, and red and grey granites.

Zoology.—Almost the only wild animals in J. are wolves, foxes, wild boars, and hares, and even these are only found in the remote parts. The law, however, protects wild deer. The sheep, goat, ass, and mule are alike unknown. Oxen and cows are only used as beasts of burden, as flesh meat is never eaten, and even milk and butter are not common articles of food. Dogs are regarded as sacred, and cats are plentiful, yet the islands are plagued with rats and mice. The waters abound in fish, which, in addition to rice, forms the staple food of the

people. The birds are very numerous, including the falcon, pheasant, heron, crane, lark, teal, mandarin-duck, &c. Among the few reptiles are varieties of snakes, lizards, and the tortoise. The most peculiar insects are the winged grasshopper, the white ant, and many brilliant coloured moths.

Inhabitants, Manners, and Customs.—The Japanese are regarded by Latham as Turanians, and by Prichard as Malays. Their language is, more than that of any other island, purely and exclusively insular, *i.e.*, it has no congener on the continent with which it can be immediately connected or from which it can be definitely derived. In Yesso the Japanese is intrusive, the original language being the Aino or Kurilian. Physically, the people are generally olive-complexioned, and have oval heads and faces, high foreheads, rounded frontal bones, small dark eyes, and heavy arched eyebrows. They are singularly well-made, are easy and active in their motions, agreeable and sprightly in their manners, and on the testimony of the Marquis de Beauvoir, 'certainly the most polished people on the earth.' Proud and suspicious, the upper classes despise industrial pursuits, and glory in military life, carrying the sentiment of personal honour far beyond any other race. They are, however, imbued by a love of knowledge, are ingenious, clean, and frugal; are 'great tea-drinkers, great tobacco-smokers, and great talkers,' and, it may be added, great letter-writers. They dress in loose robes of white or brightly coloured silk or cotton, and wear neat little sandals of plaited straw. On the back of the dress is usually embroidered the armorial device of the wearer or of his master—in red, blue, green, and yellow—or a designation of the wearer's trade. Many of the men are only clad in a loin-cloth and sandals, and are tattooed from head to foot in the most brilliant colours, with figures of dragons, women, warriors, &c. The ladies fasten their long black hair in three stages by ornamented pins; they frequently powder and paint their cheeks and gild their lips. After marriage they have a strange custom of blackening the teeth and shaving off the eyebrows. Priests and doctors shave the whole head, but the usual custom is to train the hair into a pigtail about 4 inches long. The wooden houses, of which the greater part of the towns consist, are marvels of joinery, built without a single nail, and entirely destitute of painting. A light roof is supported by a frame of pine-wood, and the walls of a transparent cotton-paper, slipped into double grooves, can be removed by one turn of the hand. During the day the little kiosks are open to the four winds, and at night, when the wall-curtains are drawn, they glow like lanterns. Fires, of course, are common, and as checks there are numerous watch-towers and regular native fire brigades. Perhaps the two most distinctive customs of J. are the Harri-kari (q. v.), a legalised honourable mode of suicide, and the promiscuous bathing which is general throughout the country. The people observe many holidays, and delight in theatre-going, dancing, juggling, and wrestling. The use of opium is rigidly prohibited, but there is considerable indulgence in saki, a spirit distilled from rice. Great honour is paid to the dead, and the cemeteries are adorned with beautiful carved granite monuments.

Industries and Commerce.—The Japanese are singularly skilful in the manufacture of silks and cottons, and are unsurpassed by any nation in the world for the exquisite beauty of their porcelain, lacquer-work, and bronzes. They early received the art of lithochrome-printing from the Chinese, and are now admirable engravers of maps and book-illustrations. The native artists are familiar with, and practise, the rules of perspective, contrary to the common opinion, which is based on pictures that are sold in Yedo for the tenth part of a penny. See Audsley and Bowes, *Keramic Art of J.* (Parts 1 and 2, Liverp. 1876). The chief exports are tea, raw silk, silkworm's eggs, copper, dried fish, rice, coal, and tobacco; and the staple imports are cotton and woollen fabrics, arms, and ammunition. In 1875 the total value of the former amounted to £3,602,978, and of the latter to £5,893,413. British exports to J. amounted to £2,460,227, and the imports thence to £377,791. Most of the ports are linked together by telegraph, and in 1876 railways were completed from Hiogo to Osaka and Kioto (50 miles) and from Yedo to Yokohama (20 miles).

Government, Finance, &c.—The system of government, established in 1869, is one of absolute monarchy. The Mikado ('the venerable') is supreme in temporal and spiritual affairs, and acts through an executive ministry, divided (in imitation of that of France under Napoleon III.) into the eight departments of the Imperial House of Foreign Affairs, of War, the Navy, Finances, the Interior, Justice, Education, and Ecclesiastical Affairs. A *sain*, or senate of thirty members, and a *shoïn*, or Council of State, of an undetermined number of members, are both nominated by the Mikado. Affairs of unusual importance are decided by a Great Council, presided over by the Mikado, and consisting of the shoïn, the prime minister, vice-prime minister, with five advisers, and the ministers and vice-ministers of the eight departments. Ordinary matters are decided by ministers individually or in cabinet. Since 1871 the administration in the provinces has been in the hands of prefects, who cannot carry into execution sentences of death or banishment until they are confirmed by the Minister of Justice. In 1874, according to official returns, the revenue amounted to £9,750,000, and the expenditure to £9,320,000. The chief source of revenue is the land-tax (levied in rice); other sources are the maritime and customs' duties, stamps, taxes on alcoholic liquors, &c. In a published budget, approved by the Great Council, the estimated revenue for the financial year 1875-76 was £13,717,653, and the expenditure, £13,699,701. In 1875 the public debt consisted of £5,143,000 internal, and £1,102,000 foreign liabilities. The national coins are the silver ichibu = 1s. 4½d., and the yen or dollar = 4s. An imperial mint, with machinery made in England, was opened at Osaka in 1870, and the new coins are 10, 5, and 2½ dollar pieces; and 50, 20, and 5 cents, besides several small copper coins. In 1874 the number of letters transmitted was 17,095,842, and there were in J. 3244 post-offices. The army of J., under the command of the Mikado, does not probably exceed 80,000 men. A decree of 1872 made liability to arms universal, but had not been given effect to by 1876. Japanese officers have in recent years been instructed by the French at Yokohama. In 1876 the navy comprised two ironclad corvettes, two wooden corvettes, three schooners, one gunboat, one transport, and one yacht; and was manned by 1200 sailors, including 67 artillery-men and 260 marines. Three ironclads—a frigate of 2500 tons and two corvettes of 1700 tons each—were being constructed in England in 1876. Naval instruction is given by thirty-one English officers, who arrived in the country in 1872.

Religion and Education.—The two great religions are Sintuism (*sin*, 'the gods,' and *syu*, 'faith') and Buddhism, while the higher classes are partial to the teaching of Confucius. Sintuism is the ancient faith of the country, and there are only ninety-seven Sintu temples, while the number of Buddhist temples is not less than 296,900. Education has recently made great strides, the annual grant being now about £60,000. At the expense of the Government many young men have been sent to study in America (till 1875 about 500), England, France, and Germany. In 1871 America was visited by five young lady students. A law of 1872 decreed the establishment of 53,760 schools, the expense of which is to fall eventually on the people. Native education is widely diffused, the common people can generally read and write Japanese, and the cultured are more or less advanced in the study of Chinese, which has been to them a classical language. Yedo has a university (attended in 1875 by 345 students), comprising colleges of medicine, jurisprudence, philosophy, mining, &c. There are also a school of foreign languages, and a normal school for teachers. Books and newspapers in Japanese and English are daily multiplying.

Language and Literature.—In J. there are three alphabets—(1) the *Kata-Kana* ('side letters'), anciently derived from Chinese hieroglyphics, and used chiefly by scholars; (2) the *Karina*, now called simply *Kana*, with forty-eight letters, which is syllabary; and (3) another form of the *Kana*, invented by a Buddhist priest about 1000 years ago for the purpose of assimilating its letters to those of the sacred books. The simplified Kana or *Hira-Kana* ('plain letters') is most in use. The Japanese, with its seventy-two syllables, is one of the most flexible and melodious of spoken languages. See E. M. Satow, *English-Japanese Dictionary* (1876), and Alcock's *Japanese Grammar* (1861). The literature, which is voluminous, is divided into three general classes—(1) *Kangaku*, or Chinese classical literature and works regarding it, including the Buddhist literature; (2) *Wagaku*, or a strictly native literature of history, geography, art, and old metrical legends; and (3) *Kasaku*, or the literature of fiction, which is singularly varied and extensive.

History.—The authentic chronology of J. goes back to 667 before the Christian era, and the first great historical character

is the Mikado Sinmu, who after a career of conquest founded a dynasty which has endured for upwards of twenty-five centuries. Much of the early history is of a purely local interest and character. In 1192 the reins of government were plucked from the hands of a feeb'e sovereign by Yoritomo, the Shiogun or generalissimo (called in recent times the *Tycoon*, from the Chinese *Tai Koon* 'great lord'). A permanent system was thus established by which the latter residing at Yedo remained his actual ruler, though doing homage to the Mikado at Miako. The Europeans later took the Shiogun for emperor and the Mikado for a spiritual dignitary. In 1543 the Portuguese traders first found their way hither, and St. Francis Xavier followed in 1549. In 1603 Tokugawa Jyeyas ('the illustrious'), whose descendants held the Shiogunate till 1868, inaugurated a policy of isolation, which closed the ports against an increasing foreign traffic, and stamped out the Roman Catholic religion by the massacre of some 50,000 converts. A single Dutch factory was allowed to remain on the island of Hirado, but the system of rigid exclusion triumphed till 1853, when Commodore Perry led a squadron of U. S. war-ships into the harbour of Yokohama, and wrested from the Shiogun the first of the series of modern treaties. Since 1854, the ports of Kanagawa, Yokohama, Nagasaki, Hiogo, Osaka, Hakodate, Yedo, Niigata, and Kagoshima have been opened to foreign commerce. The *Daimios* or territorial princes, alienated by the unauthorised acts of the Shiogun, were bitterly opposed to the invasion of foreigners. Many assassinations occurred during the subsequent ten years, but the bombardment of Kagosuhima Chioshiu by the English and allied fleets (1863) tended to produce a complete revolution of opinion in favour of foreign relations. The Shiogun was deposed and the Mikado was placed at the head of the reformed government in 1868. In 1870 a great embassy visited the United States and Europe, and subsequently the calendar of the western nations was substituted for that of old J., and English was adopted as the official language. The Daimios, who in 1862 numbered 216, with revenues ranging from £15,000 to £915,500, and who had long played the part of independent sovereigns, submitted to the Mikado after more or less resistance. The *Samurai*, the former military class, nearly 2 millions in number, have been deprived of their pensions and incomes, which kept the country in poverty for centuries, and the disaffection thus caused has shown itself in a series of insurrections. The defiant isolation of the powerful and warlike Satsuma clan still frustrates the efforts of government to effect complete imperial unity. After the suppression of the revolt at Kumamoto in February 1877 great apprehension was felt of a general rising of the Satsuma, which would be a severer trial than the government has had to face since the Restoration. See Sir R. Alcock's *Capital of the Tycoon* (2 vols. Lond. 1863); Lawrence Oliphant's *Narrative of Lord Elgin's Mission* (Lond. 1859); and the works of Lindau (Par. 1864); Dickson (Lond. 1869); Du Pin (Par. 1868); Jephson and Elmhirst (Lond. 1869); Humbert (Par. 1870); Taylor (New York, 1871); Mitford (*Tales of Old J.*, 2 vols. Lond. 1871); F. O. Adams (2 vols. Lond. 1875); Mossman (Lond. 1875); Bousquet (Par. 1876); and Griffis (New York, 1876).

Japann'ing, the term for the process of applying varnish or Lacquer (q. v.) to articles of wood, metal, and papier-mâché, and hardening it by heat. The art is carried to great perfection in Japan, whence the name. In J. metal, a japan ground, prepared with a pigment and shellac or animé varnish is first applied, and then the varnish alone in successive coats; each coat is dried and hardened in an oven before another is laid on. Decoration in colour and gold is placed on the japan ground with peculiar gold-size made with boiled linseed oil, animé, and vermilion. The article is finished by being polished with felt and fine powdered pumice, and with oil to give final lustre. Wood and papier-mâché are similarly treated.

Japh'eth (Heb., apparently derived in Gen. ix. 27, from *pathach*, 'to extend,' but more probably from *yaphach*, 'to be fair'; *cf.* Ham, 'sun-burnt') was one of the three sons of Noah (Gen. v. 32). His seven sons were the progenitors of the non-Semitic and non-Hamitic races, who at first occupied 'the isles of the Gentiles' (Gen. x.). There is a noteworthy resemblance in the names between J. and *Japetos*, the ancestor of the human race according to the Greeks.

Japu'ra, a tributary of the Amazon, 1000 miles long, rises in the Granadian Andes, Columbia, flows E. and joins the larger river about 10 miles above Ega.

Jarnac, Battle of, was fought near the town of that name (13th March 1569) on the banks of the Charente, between the Catholic army of the Duc d'Anjou, afterwards Henri III., and the Huguenot troops of Coligny. Owing to the self-will of the Protestant gentlemen and their want of obedience, Coligny, while leading off the vanguard of his army from the Charente, was surprised by the Duc d'Anjou. Condé, who galloped back from the front with some cavalry, was slain, and the Protestants were defeated.

Jar'oslav, a central government of European Russia, formerly a principality. Area, 122,988 sq. miles; pop. (1870) 1,000,748. It is watered by the Volga, Mologa, Scheksna, and Kostroma, and of the surface five-twelfths is arable land, and one-third is covered with forest. The chief industries are the growing, spinning, and weaving of flax, kitchen-gardening, and the manufacture of hardware (springs, nails, &c.) The chief towns are J., Uglitch, Rybinsk, Rostov, and Mologa.

Jaroslav, the capital of the government, on the right bank of the Volga, 165 miles N.N.E. of Moscow by rail. It is a handsome city, with countless towers and cupolas. The river banks are lined with palaces, and there are sixty-six churches and three convents. Among the manufactures are linens, cottons, large bells, white-lead, and silks. Pop. (1870) 27,268. J., said to have been founded by Jaroslav the Great in the 10th c., is one of the oldest towns of Russia.

Jarr'ah (*Eucalyptus marginata*), a valuable tree found only in Western Australia, where it forms extensive forests. When sound, and felled at the proper season, the J. timber is of great value for use as wharf piles, railway sleepers, and telegraph posts, as it then contains a pungent acid which repels even the *teredo navalis* and white ant. Large quantities of it are exported to the other Australian colonies and to India. J. is also used for parts of ships under water, and vessels planked with it do not require copper sheathing. The wood, however, cracks in the sun, and will not bear a heavy transverse strain. See Laslett's *Timber and Timber Trees* (1875).

Jarr'ow, a town of Durham, England, on the S. bank of the Tyne, 7 miles E.N.E. of Newcastle by rail. The church of St. Paul was wholly rebuilt in 1866, with the exception of the choir and tower. These show two dates of work, both Primitive Romanesque, the former, in which Beda (q. v.) doubtless worshipped, having been erected by Benedict Biscop (674–85), while the latter was rebuilt by Ealdwine (1074). Other edifices are Christ Church (1869), in Early English style, a Presbyterian chapel with a spire 130 feet high, a Roman Catholic Church (1861), and the Mechanics' Institute (1864), a brick Elizabethan building with a clock tower of 150 feet. J. owes its present importance to docks constructed since 1855 at a cost of £150,000. The dock and tidal basin have together an area of 50 acres, the latter measuring 150 by 100 feet. Messrs. Palmer's Iron-Shipbuilding Company employs 10,000 hands, and turns out vessels averaging 12,000 tons per annum (amounting on one occasion to 22,000 tons). J. publishes two weekly newspapers, and its pop. (18,179 in 1871) was estimated (1877) at 25,000. See vol. v., p. 897, of Freeman's *Norman Conquest* (Oxf. Clar. Press, 1876).

Ja'shar, Book of, is mentioned in two passages of the Old Testament (Josh. x. 13, and 2 Sam. i. 18), from which it appears to have been a collection of heroic poems. Two rabbinical books of Jashar have been published; one by Jacob Meir or R. Tam, at Cracow, 1586; the other at Venice, 1625. A forgery called the *B. of J., translated into English from the Hebrew by Alcuin of Britain*, was published at Bristol in 1751, by Jacob Ilive. But the most famous of all is *J., Fragmenta Archetypa Carminum Hebraicorum Collegit, &c.*, by J. W. Donaldson (Berl. 1854). In this work the author undertakes to collect the scattered parts of the book referred to in the Old Testament, on the foundation of the two passages in which it is mentioned, and 'a true perception of the meaning of the term *J.*,' which he makes to be *just* and *righteous*, and which contains 'the substantial expression of the religious and theocratic ideas of the chosen people—their idea of the nature of God (the Just One: *cf.* Deut. xxxii. 4), and of his dealings with men, of

the connection between man's duty and man's happiness, and of all that was and ought to be distinctive of their own nature, in contrast to the condition of the nation before it was specially selected by God (making Israel, from *J.* and *El*, to be those whom God has made just and happy), and to the other nations from whom they were separated.' See Donaldson's *Christian Orthodoxy* (1857), and an essay on J. in E. Deutsch's *Remains* (1874).

Jas'min, Jacques, or **Jaquon Jansemin**, a famous Languedoc poet, was born at Agen, 6th March 1798, became a barber, and attracted customers to his shop not only by the skilful use of his razor, but by his singular spontaneity in the composition of verse in the patois of the S. of France. In 1835 he published a collection of romances, burlesques, poems, and odes (*Las Papillotos*), and the same year *L'Abuglo de Castel-Cuillé*, (in 1840) *Françonnette*, (1844) *Marthe-la-Folle*, (1845) *Les Deux Frères Jumeaux*, (1849) *La Semaine d'un Fils*, all of them written in patois, and dealing with the common theme of local tradition. His rapid power of improvisation J. corrected by devoting himself to poetry as an art, and added to the qualities of wit, liveliness, and dash a truthfulness, simplicity, sobriety, and power of appropriate condensation which induced Sainte Beuve to classify him with Theocritus, Horace, and Gray. In using the patois of his native district, J. elevated it to the dignity of classical perfection which it had attained during the 13th c. 'If,' it was said concerning him, 'France had ten poets of J.'s influence, she would have no revolution to fear.' J. was elected member of the Academies of Bordeaux and Agen, Chevalier of the Legion of Honour (1846), and died 4th October 1864, in his native town.

Jas'mine, or **Jess'amine**, a name given to several plants of the natural order *Jasminaceæ*. They are shrubs or climbing plants, with clusters of white or yellow flowers, and are highly prized both for their beauty and the fragrance of their flowers. Some of the plants have medicinal properties; the leaves of one species being used against tapeworm, the root of another against ringworm. The fragrant essential oil of J. is obtained from *J. officinale* and *grandiflorum*.

Ja'son. See ARGONAUTS.

Jas'per, an opaque variety of massive quartz, of which there are several varieties differing in colour and external appearance. Common or red J. is of a bright blood colour, owing to the presence of peroxide of iron; Egyptian J. is streaked, banded, or mottled with yellow and brown, approaching the agate in appearance; porcelain J. is formed of clay rock by the action of heat, and is a kind of natural porcelain. The varieties of J. take a fine polish, and are much used for engraving cheap seals and the commoner kinds of ornamental lapidary work.

Jass'y (Slav. 'the marshy place'), the capital of Moldavia, Roumania, on the swampy Bachlui, an affluent of the Pruth, 9 miles W. of the main stream, which forms the Russian frontier, and on the malarious slopes of the Kopoberg Mountains. It is for the most part regularly built, but is intersected by crooked alleys; and the palatial mansions, the Chika Vogorides and Sturdza, of the Bojars are enclosed in walled courts, surrounded by filthy huts. There are seventy Greek churches, ten convents, one Protestant, one Roman Catholic, and one Armenian church, many small synagogues, a large new metropolitan church, a church of the Three Saints, built in the 13th c., the Ministerial and Assembly buildings, around which are the barracks, a handsome theatre, fine shops and warehouses, and innumerable khans or Eastern restaurants. The Kopo is a beautiful public garden. Owing to the dust and mud of the streets there is an unusual demand for conveyances, the estimated number of private equipages being 1300, of droskies 5000, and of horses 13,000. Skuleni, the port of J., is 8 miles down the river. J. has a wretched Tartar suburb, and a suburb called Pokurar, occupied by German artificers. Pop. 90,000, of whom one-third are Galician and Russian Jews, and 5500 Bojars, with 3000 gypsies and 3300 servants. According to Vaillant, the Jews of J. are the descendants of the Avars who embraced Judaism. They have Tartar physiognomies, and their rabbis call themselves Khagans.

Jász-Berény, a town of Hungary, in the free district of Jazygia, on the Zagyva, 45 miles E. of Pesth. It includes two woody river islands, and has a Greek church, a Franciscan convent, a townhouse, gymnasium, &c. There is a trade in corn, cattle, and wine. A monument in the heart of the town is said to mark the grave of Attila. Pop. (1869) 20,233.

Jat, Jut, or **Jaut**, the name of the dominant tribe throughout the Punjaub, also found in Scinde, Rajputana, and the N.W. Provinces. In religion the Jats are indiscriminately Mohammedans, Hindus, or Sikhs, but the first of these three form the majority. In physiognomy they are decidedly Aryan, and they make excellent soldiers. Their methods of cultivation are good, and they are also breeders of cattle and camels. The democratic village community exists among the Jats in its full perfection. Their language is a derivative of Sanskrit, not widely differing from the Hindi. A plausible theory assigns to the Jats a Scythic origin. See Campbell's *Ethnology of India*, in the *Journal of the Asiatic Society* for 1866.

Játi'va, San Felipe de, an old town of Spain, in Valencia, on the Guadamar, 20 miles from the coast, and 40 S. by E. of Valencia by rail. Its alamada is ornamented with a palm-alley. The great castle has been several times used as a state prison. Pop. 13,200. J. is the Roman *Setabis*, and was anciently famed for its flax and linen manufactures. The Borjas (Ital. *Borgias*) are an old J. family.

Jat'ropha, a genus of plants (*Euphorbiaceæ*), some of which yield an oil, and others very poisonous juices, the active principle of which appears to be prussic acid. The *J. manihot* yields a poisonous juice and much starch. The root is disintegrated and the starch extracted from it, which, after having been washed and dried, constitutes Brazilian arrowroot or tapioca. The seed-kernels of *J. curcas* yield about 37 per cent. of an oil which is colourless, and is devoid of smell and marked taste; but it is powerfully purgative, 10–15 drops producing an effect. On account of its being so much more powerful than castor-oil—which is also derived from a Euphorbiaceous plant—it used to be called *Oleum infernale*. It is surpassed, however, in activity by Croton oil (*C. tiglium*, Euphorb.).

Jau'er (Slav. 'the place of the maple-tree'), a town in the province of Silesia, Prussia, on the Neisse, 37 miles W. of Breslau, is noted for its corn trade and sausage-making, and was formerly capital of the principality of J., which extended to 1218 sq. miles. J. was once the centre of the Silesian linen trade, but suffered severely from the Thirty Years' War. Pop. (1875) 10,404.

Jaun'dice, Ic'terus, or the **Yellows**, are terms which comprehend a group of diseases of the liver, the prominent symptom of which is the yellow colour of many of the different tissues and fluids of the body, but more especially of the conjunctiva and the connective tissue. The first symptom of J. is a yellowness of the white of the eyes, then of the roots of the nails, next of the face and the neck, and ultimately of the whole body. At the earliest stage, the urine becomes of a deep-red colour, stains the linen yellow, and is changed to a deep green by the addition of nitric acid; and, at the same time, the evacuations are of a white, clayish colour, generally relaxed, but sometimes constipated. J. is always associated with a white tongue, a bitter taste in the mouth, distaste for food, inaptitude for all exertion, great depression of spirits; and there is, occasionally, some slight pain over the liver, headache, nausea, and vomiting. J. may arise in two ways:—(1) By the mechanical obstruction to the passage of the bile into the intestines, and the consequent *reabsorption* of the detained fluid into the blood. This condition may be caused by the obstruction of a calculus in the common hepatic duct; by obstruction of the gall-ducts from tumours in the liver, disease of the head of the pancreas, or of the duodenum. (2) By *suppression* of the biliary secretion, arising from some morbid condition of the liver itself, in consequence of which biliary ingredients may accumulate in the circulation. *Treatment:*—When J. is due to *congestion* of the liver, mercurial purgatives in combination with aloes and nux vomica with rhubarb; but acids and alkalies are contra-indicated. Benzoic acid is useful in cases of innervation; but injurious when there is obstruction. Podophilin, combined with hyoscyamus, is useful in cases of suppressed secretion, and with vegetable tonics in feeble liver; but is also contra-indicated in obstruction. Sulphate of magnesia, in drachm doses, with fifteen grains of carbonate of magnesia, and half a drachm of aromatic spirits of ammonia, given three times daily

before meals, is also highly recommended. See Dr. Harley *On Jaundice*, Dr. Budd *On Diseases of the Liver*.

Ja'va, or **Yava-Dwipa** ('barley island'), the finest of the larger Sunda Islands, in the Indian Archipelago, and one of the richest countries in the world, lies in lat. 5° 2'–8° 0' 50" S., and in long. 105° 12'–114° 0' 39" E. It is separated on the W. from Sumatra by the Sunda Strait, 25 miles wide; on the E. from Bali by the Bali Strait, which narrows to 6 miles; and on the N. from Borneo by the wide expanse of the shallow Sunda or J. Sea; while in the S. it is washed by the open Indian Ocean. Area, 51,336 sq. miles. Its extreme length from E. to W. is 660 miles, and its greatest breadth 140 miles. From E. to W. it is traversed by an irregular mountain range, richly clad with magnificent forests, and attaining its greatest heights of 12,250 feet in Semiru, and of 11,320 in Slamat. Active volcanoes are numerous, especially in the S.E., and are remarkable for their great discharges of sulphur and sulphurous gases. Fish cannot live in the sea near the mouth of a stream that issues from the lake in the vicinity of Jaschem (a volcano in the E. of J.) owing to the waters being so impregnated with sulphuric acid; and the Vale of Poison, near Batar, is strewn with the bones of animals that have been killed by the exhalations of carbonic acid gas. The eruptions of Papandayang in 1772 and of Galunggong in 1822 were very destructive. The mountains in the S. are steep and rugged, but in the N. they decline more gradually to the low coast plains and mangrove swamps. The navigation of the coast is difficult, but in the N. there are a few good harbours, as those of Batavia and Surabaya, and several fine roadsteads. Of the many short and rapid streams, only a few are navigable, as the Solo, Kediri, and Tjimanock. J. is in great part covered by luxuriant and valuable forests of teak, drammar-pine, fig-trees, &c. Coffee, the staple product, is cultivated to a height of 2000 feet, and other abundant crops are sugar, cotton, rice, indigo, tobacco, and spices. Buffaloes are generally used in agriculture, and among the wild animals are the king-tiger, the one-horned rhinoceros, the wild ox, two varieties of the wild hog, large bats five feet across the wings, and many kinds of apes, while the waters are abundantly stocked with fish. Gold-dust is found in several rivers; mineral springs are numerous; coal and rock-salt occur in the mountains, but there is no mining. The climate is unhealthy only in the marshy regions of the N. coast; the temperature in the lowland is very equal, seldom rising above 90° F., or falling below 70° F. During the equinoxes there are generally violent winds and thunderstorms; the wet season, with its W. winds, lasts intermittingly from October to March. Earthquakes are not unfrequent; that of 1867 is said to have killed 300 persons. In 1873 the pop., which has nearly quadrupled since 1816, amounted to 17,855,840, of whom 27,009 were Europeans, 190,603 Chinese, 22,958 Arabs and others, and the rest natives. The Javanese are the most civilised people of the Malay race. Small in stature, yellow in colour, patient and cheerful in temperament, they are perhaps [illegible]e best agriculturists in Asia, and show much industrial [illegible] ingenuity. They are chiefly employed as agricultural [illegible]s, and are professed Mohammedans. The language of t[illegible]ter part of J. differs considerably from Malay proper, a[illegible] Sundese, which is spoken in the W. of the island. It has [illegible]ty consonants and six vowel sounds. It is rich in fine objec[illegible] distinctions, but is utterly lacking in abstract expressions. The literary fragments—dubious chronicles, religious writings, and resetting of Hindu poems—are of very early date.

The most important colonial possession of the Netherlands, J. is under a governor-general and a deliberative council of five members. Including the island of Madura (q. v.) it is divided into twenty-three residencies, each governed by a resident, who is in constant intercourse with the native chiefs. The scheme of administration is known as the 'culture system,' and was established by Van den Bosch in 1832. It provides for official control and superintendence of native labour, so as to develop most extensively the cultivation of articles for the European market. Formerly the labour of the natives was enforced in almost all agricultural operations; it is now required only on sugar and coffee plantations, and by an Act of 1870 the forced cultivation of the sugar-cane is to be totally abolished in the next twenty years. All the land belongs to the Government except the private estates in the N. W. residencies. The revenue is chiefly derived from the sale of articles at a price far above the cost of production under the 'culture system.' In 1875 the revenue was £10,433,690, and the expenditure was £9,588,458. The trade is for the most part with the Netherlands and (exclusive of specie) the imports in 1874 amounted to £7,529,000, and the exports to £11,971,000. In 1875 the value of the exports to Great Britain was £1,442,607 and of the imports therefrom £1,577,980. About one-half of the rice is shipped to Borneo and China. The *Nederlandsche Handel Maatschappij*, established in Amsterdam in 1824, is sole agent in buying and importing into J. all Government supplies, and of exporting the produce of the colony and selling it in Europe. In 1876 there were in the island 160 miles of railway, comprising lines from Samarang to Djokdjokarta and from Batavia to Buitenzorg. An Act for the construction of a network of railways at the cost of the Government was passed in 1875. J. is connected by telegraph with China, Australia, Europe, and America, and has an army of about 30,000 men and 1200 commissioned officers; more than one-half of the former are natives, and all the latter are Europeans except (1876) seven natives of high rank. In 1876 the navy consisted of 1 screw-frigate, 2 corvettes, and 26 smaller steamers.

The early faith of the Javanese was Buddhism, and throughout the island are scattered many Buddhist temples. (See BORO BUDDOR.) Mohammedanism found its way hither in the 14th c. In 1511 the Portuguese first visited J., and in 1595 the Dutch erected the first factory. After much fighting the island was nominally made a Dutch colony in 1677. On the incorporation of Holland by France in 1811, the English took J., but restored it to the Dutch five years later. In 1830 the whole island was subjugated, after a fierce protracted struggle with the natives. See Sir Stamford Raffles, *History of Java* (2 vols. Lond. 1817); Müller *Beschreibung der Insel Java* (Berl. 1860); Wallace, *The Malay Archipelago* (Lond. 1869); Goeverneur, *Nederlandsch Indie* (Leyden, 1870); and Wenzelburger, *Nederländisch-Ostindien* in *Unsere Zeit*, vol. ix. (Leips. 1873).

Jav'elin (Fr. *javeline*, from Armor. *gavlin*, connected with Ger. *gabel*, 'a fork'), a light dart, used in hunting, and hence the word is often erroneously derived from the Span. *javal*, 'a wild boar.' The J. corresponds to the *cidôn* of the Old Testament, the *hyssos* of Polybius, and the *pilum* of Roman writers. The last was about 6 feet 9 inches long; had a barbed iron head and a shaft of tough wood, and was used either to throw or thrust with. Two *pila* formed with a sword the equipment of the *hastati*.

Jaw, the name applied in anatomy to two bones, viz., the *upper* and *lower*. *Upper Jaw or Maxilla Superior* is one of the principal bones of the face. It enters also into the floor of the orbit, the floor and lateral portions of the nasal cavity, and forms the greater part of the hard palate. It consists of an *ascending* or *nasal* process, which is situated superiorly; an *alveolar* process situated inferiorly, which contains the sockets for the upper teeth; a *nasal surface* situated internally, in which surface there is an opening leading into a large cavity situated within the bone and called the Antrum of Highmore, and an *external surface*, convex in shape, which forms the anterior and lateral parts of the face. To the upper J. are attached various muscles which act principally upon the lips and angles of the mouth.

Lower Jaw or Mandible.—A bone which is present in vertebrate animals, and which has its representative in some of the classes of invertebrate animals. In the vertebrate kingdom, the condition of the lower J. forms, along with other conditions, a means of subdividing this kingdom into three sections. In birds and reptiles each half of the J. is made up of several pieces, and the bone articulates with the temporal bone of the skull, not directly, but by the intervention of a bone, the *quadrate bone*. In most reptiles the halves are only loosely connected, and the teeth are not usually placed in distinct sockets. In mammals, each half of the lower J. is composed of only a single piece, and articulates directly with the temporal bone of the skull. There is no *quadrate bone*. The teeth in all the members of this class are planted in distinct sockets.

Lower Jaw in man is the strongest bone of the face. It consists of a middle portion placed horizontally, the *body*, and two ascending processes, the *rami*. The *body* is marked in the middle line by a rough ridge, placed vertically, and marking the original division of the bone into two parts. This ridge is called the *symphysis*. The inferior border of the bone is thicker

nearer the middle line than in the rest of its extent. This thicker portion, by being everted slightly, gives rise to the prominence called the chin. The superior or alveolar border is hollowed out for the lower teeth. On the internal surface of the bone, near the symphysis, there are four tubercles or prominences, situated in pairs, and below these tubercles two depressions. These tubercles and depressions give attachment to muscles which depress the lower J., and therefore open the mouth; or, if the lower J. be held immovable by the action of other muscles, they will, by their action, elevate the larynx. The external and internal surfaces of the *rami* are rough for the attachment of muscles. The muscles attached to this bone are to *the body* muscles which act upon the lower lip and angles of the mouth, and to the *ramus* muscles concerned in mastication. The form of the *angle* varies at different periods of life. The lower J. is united to the rest of the skull by means of the condyle, which articulates with a depression on the temporal bone. This depression, the *glenoid fossa*, is deepened by the presence of an inter-articular fibro-cartilage, biconcave in shape. The bones are held in position by an external and an internal lateral ligament, and by a capsular ligament which closely envelops the joint. These ligaments allow of the movements of elevation, depression, a gliding movement backwards and forwards, and a certain amount of lateral movement. To facilitate such movements there are two synovial membranes in the joint; one between the glenoid fossa and the upper surface of the inter-articular fibro-cartilage, and one between the condyle and the lower surface of the same cartilage. One of the muscles, the *external pterygoid*, is attached not only to the neck of the J., but also into the inter-articular fibro-cartilage, the object of this arrangement being to pull forward the cartilage along with the condyle, and thus lessen the risk of dislocation of the J., which would be liable to occur in the absence of such a provision.

Jaxar'tes (Arab. *Saihún*, Pers. *Sír Daria*, 'Yellow River'), the Greek name of a large river rising in the Thian Shan Mountains in Central Asia, and flowing W. and N.W. through the valley of Khokan and the sandy desert of Kizil-Kum into the Sea of Aral, separating Sogdiana from Scythia. The J. was supposed to fall into the N. part of the Caspian (which is first distinguished from the Sea of Aral by Ammianus Marcellinus in the 4th c. A.D.), but the accounts of it in ancient writers are very conflicting. The Jaxartæ, a Scythian tribe, lived on its banks. The sources of the J. were first discovered by Baron Kaulbars in 1869. In its lower course its banks are low, and consist of sand or clayey soil impregnated with salt. Before reaching the Kizil-Kum steppes it flows through a land that is only equalled in luxuriant vegetation by the richest valleys of India. Its length is estimated at 1800 miles, of which 900 are navigable. The J. below Khojend is now in the Russian territory of Turkestan, and on its banks the forts of Aralsk, Kásaly, Karmákchi, and Perovsky, form the famous so-called 'line of the Sír Daria.'

Jay (*Garrulus*) a genus of Insessorial birds or perchers, belonging to the *Conirostres*, and to the *Corvidæ* or crow family. It is distinguished by a bill of moderate size, the nostrils being hidden by plumes. The fourth, fifth, and sixth quills are the longest. The hinder toe is straight and long. The genus is represented by a well-known English bird. The harsh screams of the common J. (*G. glandarius*), and its imitative powers, have won for the name 'J.' a somewhat unenviable reputation. The J. is the size of a pigeon, and is brownish above, glossed with purple. The head has a crest of grey feathers spotted with black. The wings and tail are black, and the wing-coverts banded with black. Two broods are produced each year. The eggs number four or five, and are of a yellowish white. The food consists of caterpillars, insects, fruits, and berries, and even the young of other birds. In 1744 the J. was condemned by a statute, and a reward of 3d. for the head of each J. was offered, on account of the supposed injuries which it inflicted on young trees. The blue J. (*Cyanocorax cristatus*) of N. America is well known. The colour is a light bluish purple. The head has a blue erectile crest. The bird is active and predatory in habits, attacking even the hawk.

Jay.

Jay, John, an American statesman, first Chief Justice of the United States, was born in New York, December 12, 1745, called to the bar in 1768, and elected to Congress in 1774. He took a leading part in the War of Independence. In 1779 he was appointed Minister at Madrid, and he signed the treaty of peace at Paris in 1783. In that year he became Foreign Secretary, in 1789 Chief Justice, and in 1794 Ambassador at London. He was Governor of New York State 1795-1801, after which he retired to private life. He died May 17, 1829. He was a leading Federalist, and his services to the American cause were only surpassed by those of Washington. See his Life by his son, William J. (1833).

Jaya-Deva, the most popular poet of the Hindus, was born near Burdwan, in Lower Bengal, some time between the 11th and 16th c. A.D. His great work is the *Gita Govinda*, which has been admirably translated by Mr. Edwin Arnold (*The Indian Song of Songs*, Lond. 1875). It represents the amours of Krishna, an incarnation of Vishnu, with the milkmaids of Brindaban, and his final reconciliation with his true lover, Radha. A mystical interpretation has sometimes been placed upon the erotic language of the poem.

Jeanne Darc ('the Maid of Orleans'), daughter of a peasant, was born 6th January 1412, at Domremy, a village in Champagne on the Meuse, and showed an early tendency towards a fervent form of religious belief. The cause of Henri VI. (q. v.) was being pushed in France during J.'s girlhood, and in the midst of war she heard, as she believed, a clear angel's voice calling her 'to have pity on the fair realm of France,' St. Catherine, St. Marguerite, and St. Michael all appearing and offering her aid. Convinced of her divine mission, she sought the Dauphin (Charles VII.) at Chinon. After submitting to the interrogatories of learned churchmen, 'who wearied her with their words,' she was put in command of a body of soldiers, and set out to Orleans to raise the English siege, in which she was successful, 29th April 1429. J. then sought the Dauphin at Loches, overcoming the jealousy of his advisers, and triumphing over the enemy at Patay, June 18, led him to Rheims, where he was crowned, July 17, 1429. J. was captured, May 23, 1430, whilst engaged in a sortie at Compiègne against the Burgundians, was placed under guard by John of Luxembourg, and sold by him for 16,000 francs to the English. 'No man had pity on her. The king and his crew of favourites made no sign; the Archbishop of Rheims denounced her; the clergy of the English party followed his leading; the University of Paris, utterly incapable of discerning her heroism, clamoured that she should be handed over to the Holy Office; the Inquisition claimed her as its victim.' In despair she flung herself from her cell window at Beaurevoir, but survived the fall, was conveyed to Rouen, subjected to a long trial on the charges of sorcery and witchcraft, and burnt 31st May 1431. The doubts regarding the story of her death expressed by [illegible] Delapierre, and others, though supported by some cu[illegible]dence, have not found much acceptance among criti[illegible]e Delapierre's *Doute Historique* (1855). 'The noble fig[illegible]ne heroine of France stands out in amazing beauty against [illegible]ack-ground of treachery, meanness, cruelty, and smoke of [illegible]ouring fire. In all she is lifted far above her countrymen and her age; in all she is perfect in her simplicity, piety, self-devotion. She stands alone on the page of history' (Kitchin, *History of France*, vol. i. p. 537). See also *Procès de Condamnation*, by Jules Quicherat, and *Histoire de J. D.*, by De Beauregard.

Jed'burgh, a picturesque old border town of Scotland, and capital of Roxburghshire, on the left bank of the Jed, 10 miles S.S.W. of Kelso, and 56 S.E. of Edinburgh by rail. It was founded by Ecgred, Bishop of Lindisfarne, between 829 and 854, was made a royal burgh by David I., and became the chief town on the Middle Marches. In the fastness of its forest, and guarded by a castle, it was frequently the residence of the Scottish kings, and the rendezvous of their armies. Its chief architectural feature is its magnificent ruined abbey, an exquisite example of the transition from Norman to Early English style. It was founded by David I. in 1118 or 1147 for Augustine friars from Beauvais, and has a tower 120 feet high, arches of a singularly mixed character, a beautifully-interlaced arcade, and a

St. Catherine's rose-window (Flamboyant). The abbey was burned by the Earl of Hertford in 1544. The present jail of the town occupies the site of the old castle. J. holds a fair industrial position; its principal manufactures are blankets, shawls, plaids, boots and shoes, and hosiery. The town is girt with gardens and orchards. Pop. (1871) 3322. Together with Haddington, Dunbar, North Berwick, and Lauder, J. sends one member to Parliament. J. was often sacked in the border wars, and its existing records only extend back to 1619.

Jedd'ah, or **Jiddah,** a walled town of Arabia, in Hedjaz, on the Red Sea, 60 miles W. of Mecca. It is surrounded by barren deserts, and the rain-water is carefully gathered in cisterns. As port of Mecca it carries on an important trade, exporting coffee, and importing provisions from Egypt, manufactured goods from India, &c. Thousands of pilgrims pass through J. yearly. A massacre of the Christians took place here June 15, 1858, and the town was bombarded by the English in the August following. Pop. estimated variously at from 10,000 to 20,000.

Jeejeeb'hoy, Sir Jamset'jee, the title indissolubly annexed by an Act of the Indian Legislature to the holder of the baronetcy conferred (1857) on the great Parsee merchant of the same name. He was born at Bombay, 15th July 1783 and died 15th April 1859, after a life equally famous for the accumulation of wealth and its charitable disposition. The commercial development of Bombay, especially as regards the export of raw cotton, is historically associated with his name; and both at Bombay and Poonah are to be seen monuments of his munificence. He was succeeded by his son, whose original name was Cursetjee Jamsetjee.

Jeff'erson City, the capital of Missouri, U.S., on the S. bank of the Missouri River, opposite Cedar City, and on the Pacific Railway. It is the seat of J. C. College (Episcopal), and has a state-house, the armoury and penitentiary of the State, eight churches, a Lincoln institute, a normal school for coloured children, large flourmills, foundries, and a factory for farm implements. Pop. (1870) 4420. There is much coal and iron in the vicinity.

Jefferson, Joseph, an American comedian, was born at Philadelphia, February 20, 1829, and became an actor when very young. His *Rip Van Winkle*, which he has played almost continuously since its first production at the Adelphi Theatre, London, 1865, is admired as much in this country as America as one of the finest of modern dramatic creations.

Jefferson, Thomas, an American statesman, was born April 13, 1743, at Albemarle County, Virginia, U.S., studied at Williamsburg, was elected (1769) to the Virginia House of Burgesses, and became a member of Assembly (1773). The form of words of the Declaration of Independence was supplied by J., though many expressions were toned down by his colleagues. After serving as Governor of Virginia and Minister to France, J. became (1789) Secretary of State under Washington, and led the Democratic party, showing a leaning at the same time to France. After the outbreak of the Revolution, he took office (1797) as Vice-president, and (1801) was elevated to the Presidency. During his tenure of office (until 1807) Louisiana was purchased from the French Government for £3,300,000, and active preparations were made for engaging in war with Great Britain. J.'s chief literary work is entitled *Notes on Virginia.* His views were at all times extreme, and his temper hot, but his career was marked by consistent honesty of conduct. He died 4th July 1826. His collected Works comprise 9 vols. 8vo. See *Memoirs and Correspondence* by his grandson, T. J. Randolph (4 vols. 1829), and Lives by George Tucker (2 vols. 1837), by G. H. Randall (3 vols. 1858), by Sarah N. Randolph (1 vol. 1871), and by James Parton (1 vol. 1874).

Jeffrey, Francis, Lord, was born in Edinburgh October 23, 1773, went in his eighth year to the High School of Edinburgh, in his fifteenth to the University of Glasgow, in 1791 to Queen's College, Oxford, and in 1792 to the law classes of the Edinburgh University. Here he joined the Speculative Society, and formed a friendship with Scott, Brougham, Horner, and others. In 1794 he was called to the bar, and began writing for the *Monthly Review*, married (1801), and (1802) became editor of the *Edinburgh Review* (q. v.), which was started at the suggestion of Sydney Smith, and which J. conducted for twenty-six years. His practice at the bar flourished apace, and after being chosen Lord Rector of the University of Glasgow (1821), Dean of the Faculty of Advocates (1829), Lord Advocate (1830), he was returned to Parliament for the Perth, Forfar, and Dundee Burghs (1830), for Walton (1831), for Edinburgh (1832), and took his seat as a Judge of the Court of Session in 1834. J.'s numerous and varied contributions to the *Review* have been published in a selection of volumes (1843), but have scarcely stood the test of time like those of Macaulay and Carlyle. It is safe to say, however, that the most trenchant and characteristic of his essays remain uncollected. J.'s most marked qualities as a critic were rapid discernment and penetration, to which he added a certain brightness of fancy, a fine if not strong scholarship, and a copious diction. In sympathetic insight he was too often deficient, notoriously so in his estimate of Wordsworth, a trait which discovers itself also in his *Treatise on Beauty*. He died at Craigcrook Castle, 26th January 1850. See Lord Cockburn's *Life of J.* (2 vols. Edinb. 1852).

Jeff'reys, George, Baron, was born at Acton, Denbighshire, in 1640, educated at Shrewsbury and Westminster, entered the Inner Temple, and commenced pleading without being regularly called to the bar at Kingston Assizes in 1666. A drunkard and bully, but of quick and vigorous parts, he won an extensive Old Bailey practice as a Roundhead and persecutor of the Catholics. In 1677, however, he turned renegade, found a patron in James Duke of York, was knighted, and the year after appointed Recorder of London. Created successively King's Serjeant, Chief Justice of Chester, and baronet (1681); J. acted as crown's counsel or judge against Russell and Sydney, Baxter and Oates, was made Chief Justice of the King's Bench in 1683, and on the accession of James II. was raised to the peerage with the title of Baron J. of Wem. In the 'Bloody Assize' that followed Monmouth's revolt, J. found work after his own heart, hanging 350 prisoners and transporting 841 as slaves to the plantations. For these services he was rewarded by the Lord Chancellorship. He showed himself a ready tool to all the king's misdeeds, notably as head of the new High Court of Commission (1686), and in the trial of the Seven Bishops (1688). He sought to follow James's example of flight, but was caught disguised as a sailor in Wapping, and committed to the Tower, where he died, April 18, 1689.

Jehan'abad, (1) a town of India, in the district of Burdwan, with a pop. (1872) of 13,409, is a centre of the weaving trade; (2) a town in Gya District, India, with a pop. (1872) of 21,022, is also the home of cotton-weavers and of general commerce.

Jehangir' (*Jahangir*), a Moghul emperor who reigned at Delhi from 1605 to 1628. He was the son and successor of the great Akbar, and it was in his reign that the Ra'jputs first submitted to the Mohammedan power. J. himself married a Rajput princess; but his better-known wife was the beautiful Nur Jehan, whose name was placed on the imperial currency, and who lies buried with him in a marble mausoleum near Lahore.

Jeho'vah is the name of the Supreme Being, which, according to the third commandment of the Jewish decalogue (Exod. xx. 7), was not to be uttered—a law which the Jews have always faithfully observed, substituting for it either the name Adonai, 'Lord,' or Elohim, 'God.' According to Exod. iii. 14, and vi. 2, the name is connected with the verb *hayah, havah*, 'to be,' and would thus mean 'He is,' indicating the self-existence, the unchangeableness and faithfulness of God. Again, according to Exod. vi. 2–8, the name was not known to the Patriarchs, but was revealed to Moses as the name by which the God of Israel was to be distinguished from all other deities. The time here indicated actually corresponds with the chronological use of the name in Hebrew literature, but, on the other hand, the statement appears to be contradicted by the fact that the name occurs frequently throughout the Book of Genesis, being known not only to Abraham (xiv. 22), Isaac (xxvi. 22), and Jacob (xxviii. 16), but to Noah (ix. 26), Lamech (v. 29), and even Eve (iv. 1), and it is asserted generally that in the time of Enos 'men began to call on the name of J.' (iv. 26). One hypothesis to account for this discrepancy is that the passages in Genesis in which the name occurs are interpolations by a later writer; another is that Exod. vi. 2–8 does not mean that the name had been unknown before the time of Moses, but

that the nature of J., to which the name particularly belonged, had not been fully revealed.

Jeisk, a town in the country of the Kuban Cossacks, in Cis-Caucasia, Russia, on a tongue of land between the Sea of Azov and the river Jeja, 50 miles S.W. of Taganrog, was founded in 1849, and is in a very flourishing state, being an agricultural centre, with a pop. of 16,747.

Jelat'ma, or **Jelati'na**, a town of Russia, on the Oka, in the government of Tambov, 170 miles E.S.E. of Moscow, with manufactures of woollens, sulphur, and vitriol. Pop. 7107.

Jeléz', a town of Russia, in the government of Orel, on the Sosna, 218 miles S. of Moscow. It has many gardens, fifteen churches, several manufactories, and its wheaten flour is famed throughout Russia. Pop. 30,540.

Jellachich de Buzim, Joseph, Baron, was born at Peterwardein, Austrian Slavonia, October 16, 1801, entered the Austrian army as sub-lieutenant of dragoons, 1819, went to Italy as captain of a regiment, 1830, and passed through the grades of major, lieutenant-colonel, and colonel. In 1848, when the court of Vienna had privately stirred up the Croatians, Dalmatians, and Serbs, to attack the Magyars, J. became the ban or commander-in-chief of the combined nationalities, led them across the Drave (September), and suffered a defeat. Afterwards at the battle of Swechat he defeated the Magyars. In the campaign of 1848–49 he was under the command of Prince Windischgrätz. The defeat at Hegyes, 14th July 1849, paralysed him for the rest of the war. At its close he was made civil and military governor of Croatia and Slavonia. J. died at Agram, May 20, 1859. In 1851 a volume of verse by J. was published at Vienna.

Jellalabadd' (*Jalalabaa*), the chief town of a district of the same name, in Afghanistan, at the head of the Khyber Pass, on the right bank of the Cabul River, 100 miles E. of Cabul, and 91 W of Peshawar. Its trade chiefly consists of the export of fruit and timber. Pop. variously estimated at from 3000 to 10,000. J. is celebrated for the gallant defence made by Sir Robert Sale and 'the illustrious garrison' against the Afghans, from November 1841 to April 1842.—The *district* of J. has an estimated pop. of 100,000. The revenue is about £40,000, and the staple crops are Indian corn and barley.

Jellinghi (*Jalangi*), a river of Bengal, the second offshoot of the Ganges, which branches off from the main stream at the village of J., and joins the Bhagirutti at Nuddea to form the Hooghly. It is the least obstructed of the direct river routes to Calcutta; the annual boat-traffic is about 30,000 tons a year.

Jell'yfish, the name given popularly to *Cœlenterate* animals belonging to the class *Hydrozoa*, and to the section *Discophora*. They are very common in the summer season around the British coasts. Each J. is a clear glassy bell, the clapper being represented by the *manubrium* or mouth of the animal. The smallest J. are the floating reproductive bodies of Zoophytes (q. v.), the true J. or *Medusidæ* corresponding to the 'Naked-eyed' Medusæ of the earlier zoologists.

Jemappes', a town of Belgium, in the province of Hainault, 2½ miles W. of Mons by rail, with extensive brewing and tanning industries, and large coal-mines in the neighbourhood. Pop. (1874) 11,274. It is famous as the scene of the victory of the French under Dumouriez and the Duc de Chartres (afterwards Louis-Philippe) over the Austrians, November 6, 1792. By this battle the whole of the Netherlands fell into the hands of the Republicans.

Je'na, a town of Germany, in the Grand-Duchy of Sachsen-Weimar-Eisenach, stands surrounded by hills at the confluence of the Saale and Leutra, on the eastern skirts of the Thüringer Wald, 9 miles S.E. of Apolda, and 23 N.W. of Rudolstadt by rail. Pop. (1872) 8197. Here Goethe composed his *Hermann und Dorothea* (1797), Schiller his *Wallenstein* (1799), and the houses of these and many other illustrious residents, are marked by tablets, erected in 1858, on occasion of the tercentenary of the university. Founded by Duke Johann Friedrich the Generous, February 2, 1558, as a home of the 'new learning,' the University of J. attained its zenith during the years 1787–1806, when it included among its professors men so distinguished as Hegel, Fichte, Voss, and the brothers Schlegel. It possesses a library, observatory, and botanical gardens, and in June 1876 had seventy-three professors and teachers, 440 students, half of whom were in philosophy, and a yearly revenue of £6000.—The *battle of J.* is a collective name often given to two separate engagements which took place on the same day, 14th October 1806—one at Auerstadt, 4½ miles N. of J., between 60,000 Saxons and Prussians under Duke Karl of Brunswick, who was mortally wounded, and 30,000 French under Davout; the other on the heights round J., between 70,000 Prussians under the Prince of Hohenlohe and the Graf von Tauenzien, and 90,000 French commanded by Napoleon in person. In both the Germans were totally defeated; and their defeat led to that utter subjugation and humiliation of the 'fatherland,' typified in the hare-hunt held two years later upon the battlefield of J. by the French and Russian emperors.

Jenn'er, Edward, M.D., the discoverer of vaccination, was born at Berkeley, Gloucester, 17th May 1749. After serving his apprenticeship to Mr. Ludlow, a surgeon at Cirencester, near Bristol, he removed to London, where he became a pupil of the celebrated anatomist John Hunter. Returning to Berkeley, he soon acquired an extensive practice, and in 1788 published his first scientific memoir *On the Natural History of the Cuckoo*, which appeared in the *Philosophical Transactions*. Meanwhile he had been studying the nature of cow-pox, and after a long series of careful experiments established the truth of the local tradition that one who had suffered from cow-pox was insusceptible to small-pox. He discovered what variety of cow-pox afforded the best protection, and in 1796 made the experiment which has resulted in such benefit to mankind. His two memoirs, *An Inquiry into the Causes and Effects of the Cow-Pox* (1798), and *Further Observations on the Variolæ Vaccinæ or Cow-Pox* (1799), roused general interest, and resulted in the wide-spread acceptance by medical men both at home and abroad of his theory and methods. Honours and rewards followed. He was elected an honorary member of nearly all the scientific societies, and received a grant of £20,000 from Parliament. He died at Berkeley, January 25, 1823. See Baron's *Life and Correspondence of J.* (Lond. 1827, 2 vols. 1838).

Jenner, Sir William, Bart., was born at Chatham in 1815, and was educated at University College, London. In 1844 he graduated as M.D., and four years later was appointed Professor of Pathological Anatomy in the University College. In 1852 he was elected Fellow of the Royal College of Physicians, and in 1862 was gazetted Physician in Ordinary to the Queen, and in the same year became Professor of the Principles and Practice of Medicine at the University College. In 1863 he was appointed Physician to the Prince of Wales, whom he attended during his severe illness in 1871–72. In recognition of his services then rendered he was made a K.C.B., having previously been created a baronet in 1868. He has written several papers of medical interest, and is widely known as the first who established that typhus fever and typhoid fever differed in kind.

Jer'boa (*Dipus*), a genus of Rodent mammalia, distinguished by very short fore-limbs, the hind-limbs on the other hand being very long, and the animal progressing by a series of leaps. The tail is long and heavy. The J. has two incisors, two premolars, and four molars in each jaw. The ears are short; the fore-feet have five toes, the hinder feet three. The common J. (*D. Ægyptus*) is found in N. Africa and Egypt. It attains the size of a large rat, and is of a light-brown hue above, the under parts being white. The long tail preserves the balance of the animal in leaping. The J. lives in burrows. Its flesh is esteemed palatable. The Gerbilles of Africa and India, and the Alactaga of Siberia, are nearly allied forms.

Jerboa.

Jeremi'ah (Heb. 'Jehovah casts') prophesied from the thirteenth year of Josiah, King of Judah (about B.C. 628; Jer. i. 2, *cf.* xxv. 3), down to the destruction of Jerusalem, and after, a period of about forty years. When Jerusalem was besieged by the Chaldean army, J. was imprisoned for predicting that the city

would be captured and burned by the besiegers, and remained in confinement till the end of the siege (xxxiv.–xxxviii.). After the capture, he remained at first in Jerusalem, and afterwards at Mizpah with Gedaliah (xxxix.–xl. 6). After the murder of Gedaliah and his adherents he was carried off by the Jewish princes to Egypt, where he probably remained till his death. There is a tradition, however, that he was stoned to death by his countrymen, and another that he escaped with Baruch to Babylon, where he died in peace. On the return from Babylon, the prophecies of J. were collected as those of the second greatest of the prophets of Israel. In the Babylonian Talmud he is even reckoned the first. The fulfilment of his predictions of the restoration of the Jews caused him to be regarded as the guardian and patron-saint of the nation; and, as in the case of Moses and Elijah, a vague expectation prevailed that he would re-appear among them to prepare the way for the Messiah (*cf.* Matt. xvi. 14). The greatest difficulty connected with the writings of J. is the variation between the Hebrew text and the lxx., the latter of which differs considerably from the former in parts of the translation, as well as in the arrangement. The genuineness of the following passages has been called in question by some modern critics: x. 1–16, xxx., xxxi., xxxiii., and lii., and l. and li, are thought to contain many interpolations. The literary beauty of the prophecies is great. In soft tenderness of sentiment J. has no equal among his countrymen. Several of the most pathetic of the psalms have also been ascribed to him.

Jer'icho, anciently an important city of Canaan, in a plain cut through by the Jordan, from which it is distant westward about 6 miles. It was the first place stormed and destroyed by the Israelites after crossing the Jordan, was rebuilt by Hiel the Bethelite, in the reign of Ahab, about 918 B.C., and became famous for its prophetical 'school' (2 Kings ii. 4, *et seq.*). J. was a favourite residence of Herod the Great. It figures in the life of our Lord, who here restored sight to the blind (Matt. xx. 30; Mark x. 46; Luke xviii. 35) and accepted the hospitality of Zaccheus. The city was again destroyed by Vespasian, rebuilt under Hadrian, captured and recaptured during the Crusades, and has now dwindled to a wretched village (*Richa* or *Ericha*) of some 200 inhabitants.

Jerked Beef is a kind of dried beef largely prepared in S. America, Mexico, and Texas. In the River Plate countries J. B. is called *charqui* (whence probably comes the English name), and in N. America it is called *tasajo*. Some years ago Uruguay exported enormous quantities to Great Britain, but it did not gain favour. *Tasajo* is largely consumed by the negroes in the W. Indies.

Jerome, Saint, is the Anglicised name by which we know **Sophronius Eusebius Hieronymus**, one of the most copious authors of the ancient Latin Church, and the most learned father of his time. Born in 341 or 342, at Stridon, in Dalmatia, he was carefully educated by his wealthy parents, and at Rome he nurtured that love for the classics of Greece and Italy which he afterwards regarded as a dangerous temptation. He soon felt a leaning to Christianity, and after travels in the Rhineland and in Gaul, was baptized at Rome in 360. In 373 he settled at Antioch in Syria, and next year began a four years' course of ascetic self-mortification and exegetical study as a hermit in a wilderness. Ordained presbyter in Antioch, he passed, after a sojourn in Constantinople and Alexandria, to Rome, where he was received with great favour by his friend the Bishop Damasus, but created many enemies by the success with which he converted sons and daughters of noble Roman houses to asceticism and celibacy. In 386 he founded, by help of one of his wealthy converts, a monastery at Bethlehem, where he lived and laboured, with one brief interruption, till his death in 418 or 419. J. opened to the Westerns the treasures of Oriental learning; his zeal and labour were indefatigable, but his character is tarnished by vanity, jealousy, and passionate intolerance. Unworthy anxiety to preserve the good fame of orthodoxy led him to assail Origen, whose enthusiastic and deeply indebted pupil he once had been, and repeatedly to suppress his own real opinions. But he laid a deep debt of gratitude on the Church, especially by his exegetical labours, and by that new Latin version of the Bible still used by the Western Church, the Vulgate. The best edition of J.'s works, comprising letters, commentaries, and treatises in theology, is by Vallarsi (Verona, 1734, 11 vols.); see Zöckler's *Hieronymus* (Gotha, 1865).

Jerome of Prag was born at Prag in Bohemia in the second half of the 14th c., studied at Paris, Köln, Oxford, and Heidelberg, took the degree of Bachelor of Theology in 1399, and soon became famous by his eloquence and learning. He threw himself passionately into the reform movement begun by his friend Hus (q. v.). When the latter was on his trial at Constance, J. hastened to defend him, but was himself arrested at Hirschau, in April 1415, and after a long imprisonment, during which he recanted his heresies and then recanted his recantation, he was burnt, 30th May 1416. See the Biographies of Heller (Tüb. 1835) and Becker (Nordling. 1858).

Jerr'old, Douglas, an English dramatist and man of letters, the son of a theatrical manager, was born in London, January 3, 1803. He was sent to sea in 1813, but left after two years to enter a printer's office. The compositor soon blossomed into an author. *Black Eyed Susan*, his first great success (1829), ran for 300 nights at the Surrey. *The Rent Day*, *Time works Wonders*, and *Bubbles of a Day*, are among the best of his plays. After 1840 he was chiefly a journalist, contributing to *Punch*, *Blackwood*, the *Athenæum*, &c. In *Punch* appeared *The Caudle Lectures*, *The Story of a Feather*, *Punch's Letters to his Son*, *Punch's Complete Letter Writer*, &c. *Lloyd's Newspaper* was started under his editorship in 1852. He died June 8, 1857. His writings sparkle with epigram and bristle with caustic wit and pungent satire. But his fierceness against abuses was the outburst of a feeling heart. As Leigh Hunt said, 'If he had the sting of a bee he had also its honey.' His *Life and Remains* were published in 1858 by his son, **William Blanchard J.**, who was born in 1826, succeeded his father as editor of *Lloyd's*, and has published many works—*Imperial Paris* (1855), *London*, illustrated by Doré (1872), *Life of Napoleon III.* (1874–75), &c.

Jer'sey, the largest and most productive of the Channel Islands (q. v.), lies about 15 miles W. of the coast of Cotentin in France, and the same distance S.E. of the Island of Guernsey. Area 28,717 statute acres; pop. (1871) 56,627. It is 10 miles long from E. to W., and 6 broad from N. to S., is high and rocky in the N., and slopes to the S. and E., where the coast is low, shelving, and broken by many bays and coves. The interior is well-wooded, and is watered by several small streams. On the S. coast is the bay of St. Aubin, on which lie the principal town of St. Helier (q. v.), and the quaint little town of St. Aubin, with its miniature castle. The only other considerable town is St. Martin, on the E. coast. J. has a singularly mild climate, the mean temperature being 52° F. Snow seldom falls, and continued frosts are rare. The myrtle, vine, peach, apricot, and plum grow in the open air. Although the holdings seldom exceed 15 acres, agriculture is in a forward state. The crops are wheat, barley, hay, turnips, potatoes, mangel-wurzel, parsnips, and carrots. Much fruit is also exported, including the famous Chaumontel pears, and the fisheries are very valuable. There is total exemption from import duties, and the exports to England are only subject to the same duties as are paid on the produce within Great Britain. J., like other Channel Islands, is governed by its own laws. The States of J. consist of the lieutenant-governor and the bailiff of the royal court, appointed by the crown; twelve jurats, elected for life by the ratepayers; twelve constables, rectors of the twelve parishes; and fourteen deputies. The bailiff and twelve jurats constitute the Court of Judicature; from their decisions an appeal lies to the Queen in council. The inhabitants speak a corrupt French dialect, but English is understood generally. French is the language of the law courts, and of the church service. The chief educational institution is the Victoria College, which has exhibitions to Oxford and Cambridge. J. is the *Cæsarea* ('Cæsar's isle') of the Romans. It has belonged to the English crown since the Norman conquest, and was unsuccessfully attacked by the French in the reign of Edward III., and during the Wars of the Roses. J. was the temporary refuge of Henry VII. while Earl of Richmond, and at a later period of Charles II. The French captured the town of St. Helier in 1781, but were forced to surrender by Major Pierson. The grand old castle of Mont Orgueil, at Gorey Harbour, was the prison of Prynne and the Parliamentarians. See the Rev. P. Falle, *History of J.*, and the interesting historical publications of the *Société Jersiaise*, founded in 1873.

Jersey City, the capital of Hudson county, New Jersey, U.S., on the W. bank of the Hudson river, opposite the S. part

of New York city, of which it is really a suburb, and with which it is connected by five ferries. It is the terminus of six railways of the Morris Canal from Eastern Pennsylvania, and of the Cunard steamship line; it has considerable foreign commerce, but as it is included in the customs district of New York, no separate returns are obtainable. J. has over sixty churches, forty-four schools, five newspapers (two German), and large manufactories of glass, iron, steel, zinc, tin, copper, boilers, machinery, locomotives, soap, candles, watches, &c. An extensive abattoir, for the daily supply of the New York market, was opened in 1874. J. C. has arisen very rapidly. There was no settlement on Paulus Hook, as the locality was called, at the beginning of the present century. The city had only a pop. of 6856 in 1820, but was increased by the annexation of Van Vorst township in 1851, of Hudson and Bergen cities in 1870, and of Greuville village in 1872. Pop. in 1860, 29,227; in 1870, 82,546.

Jeru'salem (Heb. 'inheritance, or foundation of peace') appears first in the Bible under the name of *Jebus* or *Jebusi* (Josh. xv. 8; xviii. 16, 28; Jude xix. 10, 11), which is described as situated on the boundary between the territories of the tribes of Judah and Benjamin. As has been remarked, the most striking peculiarity in the annals of J. is the number and severity of the sieges it has undergone. The men of Judah took it about B.C. 1400 (Judges i. 8), but the citadel was not taken from the Jebusites till the time of David, who captured it, and made J. his capital, surrounding the whole city with a wall. In the reign of Rehoboam, J. was taken without resistance (about B.C. 970) by Shishak, King of Egypt, who plundered the Temple and palace built by Solomon (1 Kings xiv. 25; 2 Chron. xii. 2-9), in that of Jehoram, by the Philistines and Arabians (2 Chron. xxi. 16, 17), and in that of Amaziah, by Joash, King of Israel, who broke down 400 cubits of the N. wall. It was besieged in the reign of Ahaz by the united armies of Israel and Syria, but seems to have escaped being plundered at this time (2 Kings xvi. 5). In the fourteenth year of the reign of Hezekiah (about B.C. 711), a Chaldean army advanced against J., from which it would seem to have been twice in danger, but escaped the first time by Hezekiah paying a large tribute, and the second time by the death in one night of 185,000 of the Chaldeans (2 Kings xviii., xix.; 2 Chron. xxxii.; Isa. xxxvi.). According to the Chronicler J. must have been taken by Nebuchadnezzar in the reign of Jehoiakin, when the king and the vessels of the house of the Lord were carried away to Babylon (2 Chron. xxxvi. 5-7). It was so at any rate under Jehoiakin when the Temple and palace were plundered, and 10,000 of the Jews carried off to Babylon. It was finally taken in the reign of Zedekiah by Nebuchadnezzar (B.C. 588), when the walls were levelled with the ground, the temple, palace, and other more important buildings burnt, and the bulk of the remaining inhabitants carried off to Babylon (2 Kings xxv.; 2 Chron. xxxvi.; Jer. lii.). In the second year after the return from Babylon (B.C. 534) the foundation of the Temple was laid; it was finished in the sixth year of Darius (B.C. 516: Ezra iii. 8; Esdras vii. 5). The rebuilding of the walls was not attempted till the arrival of Nehemiah (B.C. 445), by whose exertions it was accomplished in fifty-two days (Neh. ii.-vi.). There is a story, whether authentic or not, that J. was visited by Alexander the Great, after the capture of Tyre (B.C. 331). It was taken (about B.C. 320) by Ptolemy Soter, and remained in the hands of the Ptolemies till finally taken by Antiochus the Great (B.C. 198). Besieged and pillaged by Antiochus Epiphanes (B.C. 170), besieged for a short time by Aretas (B.C. 65), it was taken by Pompey (B.C. 63), when 12,000 of the inhabitants were slain, and the walls razed to the ground, and besieged and taken by Herod (B.C. 37). The greatest siege of all was by the Romans under Vespasian and Titus (A.D. 70); when taken, the city was totally destroyed, and the nation dispersed. After the capture of the city by Severus (A.D. 135), Hadrian literally razed to the ground the ruins left by Titus, and built a heathen city, which he called Ælia Capitolina. The old name was not revived till Constantine built the *Martyrion* (335) on the spot where the Crucifixion of Christ took place. The city was now undisturbed by war till it was besieged by the forces of Chosroes, King of Persia (614). Falling into the hands of the Romans again on the defeat of Chosroes by Heraclius (628), it was taken by the Mohammedans in 637, who held it with various vicissitudes till it was finally taken by the Turks in 1076. Taken by the first Crusaders (see CRUSADES) in 1099, it was retaken by Saladin in 1187. Falling into the hands of the Turks, along with Syria and Egypt, in 1517, it has belonged to the Ottoman Empire ever since, the only change being that from 1832 to 1841 it was subject to the Pasha of Egypt. Pop. of the modern J. from 15,000 to 30,000.

Topography.—J. stands on the southern extremity of a plateau bounded by the two ravines of Kedron on the E. and Hinnom on the S. and W. A third ravine, the Tyropœon, beginning at the junction of the Kedron and Hinnom, and rising up to the level of the plateau on the N.W., divides the city into two unequal halves. On the eastern spur, Mount Moriah, stood the temples of Solomon, Zerubbabel, and Herod; on the western, which is 120 feet higher, was 'the upper city' of Josephus. This western 'hill' is that which has always been known as Mount Zion, at least since the time of Constantine; but it has been maintained that in Old Testament times Zion was the eastern 'hill.' In course of time three different walls were built for the defence of J. The first was built by David to enclose the original city around the citadel he had taken from the Jebusites (2 Sam. v., *cf.* Josephus), and strengthened and extended by Solomon, doubtless so as to connect the buildings on Moriah with the rest of the city. The second was built round a part of the N. side by Hezekiah, in preparation for the attack of the Chaldeans (2 Chr. xxxii. 5). The third was built beyond the last, round the whole of the N. side, by Herod Agrippa, A.D. 45. The two most difficult points to determine in the topography of the city are, the site of the Temple, and that of the Sepulchre of Christ. (1). The Temple.—On Mount Moriah there is a large open space called *Haram es-sherif* ('Noble Sanctuary'), measuring about 1500 feet (from N. to S.) by 900 feet. In the centre is a raised platform on which stands the Mosque *Kubbet es-sakhra* ('Dome of the Rock'). Somewhere within this sanctuary the temple of the Jews must have stood; but the exact position of its site has been long a subject of the keenest controversy among travellers, two theories having been chiefly favoured: the one, that the temple area occupied the whole of the sanctuary; the other, that it was confined to a space of about 600 feet square in the S.W. corner. New light has been thrown on the subject by the excavations of Captain Warren, who has discovered that the N.E., S.E., and S.W. corners of the sanctuary are made up, from a great depth, of *debris*, and that the ridge of Moriah descends very steeply on these three sides, so that under the N.E. corner the rock is 162 feet below the present level, under the S.W. corner 150 feet, and under the S.E. corner 163 feet. As this *debris* is plainly an accumulation from the sundry demolitions of the buildings on Moriah, there can have been little or none of it in the time of Solomon, hence in all probability his temple was built on the ridge of Moriah. As the result of his labours Captain Warren concludes that its site would be a rectangle about 900 feet from E. to W. by 600 feet, at a distance of 300 feet from the S. wall of the sanctuary; and that Solomon's palace had occupied a position under the S.E. corner. The same authority considers that, to meet all the requirements of the descriptions, Herod's temple must have occupied the whole southern side of the sanctuary, covering an area of about 900 feet square. (2). The Holy Sepulchre.—There is a church in modern J. called the Church of the Holy Sepulchre, situated in the N.W. quarter of the city. The question whether this church actually marks the site of the sepulchre of Christ, or is in the same place as the one built by Constantine (335), supposing that he was correct with his site, depends so far on whether or not the spot was outside the walls of the city at the time of the crucifixion, as is required by the gospel narrative. It is certainly well within the modern wall, but those who contend for the authenticity of the site maintain that the city spread out and surrounded it after the time of Constantine. See Robinson's *Biblical Researches* (3d ed. Lond. 1871); Stanley's *Sinai and Palestine* (new ed. Lond. 1867); Warren's *Recovery of Jerusalem* (1871).

Jeru'salem Ar'tichoke, a plant of the same natural order as the common sunflower, grows 6 or 8 feet high, has large rough leaves and yellow flowers. The roots are creeping, and produce in autumn, like the potato, several round yellowish or reddish tubers which are used as food. The leaves are given to cattle. The name Jerusalem is a corruption of the Italian *Girasole*, 'sunflower,' and artichoke implies a resemblance in flavour to the common Artichoke (q. v.).

Jer'vis, John, Earl of St. Vincent, an English admiral, was born at Meaford Hall, Staffordshire, January 9, 1734. He entered the navy in his tenth year, and was made lieutenant in 1755, and captain in 1759. In 1782 he captured a French frigate, and received the order of the Bath. He was appointed Rear-Admiral of the Blue in 1787, and of the White in 1790. In 1793 he was naval commander of the expedition which took Martinique and reduced Guadaloupe. His greatest achievement was the defeat of the Spanish fleet of twenty-seven great ships, off Cape St. Vincent, on February 14, 1797, his fleet numbering only fifteen. It procured him an earldom and a pension of £3000. J. was First Lord of the Admiralty, 1801–1804. In 1821 he was appointed Admiral of the Fleet. He died March 13, 1823, and was buried at St. Paul's, where a monument is erected to his memory.

Je'si (the ancient *Æsis*), a town in the province of Ancona, Italy, 17 miles S.W. of the town of Ancona, with important manufactures of paper, silk, linen, and woollen hosiery, and trade in wine and olives. J. was the birthplace of the Romano-German Emperor, Friedrich II., and of Spontini, the composer. Pop. (1871) 13,472.

Jess'amine. See JASMINE.

Jess'ant, issuing from the middle of a Fesse (q. v.). A leopard's head *jessant de lis* has a *fleur-de-lis* passing through it.

Jess'o. See YESSO.

Jessore' (*Yashohara* = depriving others of fame), the chief town of the district of the same name, in Bengal, British India, on the Bhyrab river, 77 miles N.E. of Calcutta; pop. (1872) 8152. It has little trade, but a good school and a church. In the neighbourhood is the residence of the Rajah of J., an old Hindu family.—The *district* of J., which occupies the centre of the Gangetic delta, and is bounded and permeated by numerous offshoots of the great river, has an area of 3658 sq. miles; pop. (1872) 2,075,021. This tract has only recently been formed by alluvion, and merges imperceptibly into the Sunderbunds proper. The crops are rice, pulses, indigo, and the date and cocoanut palm. The exports are considerable, and also the manufacture of date sugar. In one town 5000 tons of this sugar are made annually, some of which is sent to England. From the Sunderbunds are despatched large quantities of firewood, and round by the same route comes the surplus produce of E. Bengal. The centres of trade are Keshubpur, Kotchandpur, and Khulna (Mr. Westland's *Report on J.*, Calcutta, 2d ed. 1875).

Jes'ter. See COURT FOOL.

Jes'uits. The Society of Jesus, founded in 1540, was one of the chief instrumentalities by which the Church of Rome recovered so rapidly from the shock of the Reformation, and regained so much of her influence in the world. As has been remarked, Ignatius Loyola (q. v.), the founder of the order, bore the same part in the Catholic reaction which Luther bore in the great Protestant movement. The nucleus of the society was formed at Paris by Loyola himself and two young men—Faber, a Savoyard, and Xavier, of Pampeluna—who shared his rooms in the College of St. Barbara. These three, three other Spaniards—Salmeron, Lainez, and Bobadilla—and a Portuguese, Rodriguez, took the vow of chastity, and 'to proceed to Jerusalem, after finishing their studies, there to live in poverty, and dedicate their days to the conversion of the Saracens, or if that were found to be impracticable, next to offer their services to the Pope, agreeing to go whithersoever he might assign them their labours, without condition and without reward.' In 1537 they were in Venice, with three other companions, prepared to set out on their pilgrimage; but this was delayed owing to the war between the Venetians and the Turks, and the project was never carried out. Meantime Loyola became acquainted in Venice with the constitution of the Theatines (q. v.), by which he was deeply impressed, and the conviction was formed in his mind that to turn their labours to the best advantage he and his companions must become regular priests. Accordingly they all entered priests' orders, and devoted themselves to preaching, assuming now the name of the 'Company of Jesus,' from the idea that they were a company of soldiers under the command of Christ, and fighting against his enemies, according to the old military associations of Loyola, who besides did not wish that the company should be called by his own name. After preaching for a time at Vicenza, they repaired to Rome, where, although they were regarded at first with suspicion, and met with considerable opposition, their mode of life and zeal in preaching, teaching the young and tending the sick, soon gained them so many adherents and friends, that they were in a position to formally organise the society, and apply to the Pope for his sanction to its institution. This sanction was readily granted, first with certain restrictions in 1540, and then absolutely and unconditionally in 1543. They deserved the special attention and patronage of the pontiff, for at a time of defection and opposition, they had sprung up a body of enthusiastic and zealous men entirely devoted to his service. To the vows of chastity and poverty they had taken at Paris, and the general vow of obedience to the order, they added a fourth and special vow 'to perform whatsoever the reigning pontiff should command them; to go forth into all lands, amongst Turks, heathens, or heretics, wherever he might please to send them, without hesitation or delay, as without question, condition, or reward.' The arrangements of the society were complete when Loyola was unanimously elected by the six oldest members the president or general, who 'should dispense offices and grades at his own pleasure, should form the rules of their constitution, with the advice and aid of the members, but should alone have the power of commanding in every instance, and should be honoured by all as though Christ himself were present in his person.'

The great aim of the constitution of the order was to release its members from all external obligations, so as to absorb their whole being in the society, and to inspire each individual with a new principle of life and action, with this peculiarity, however, that the full development of all the faculties of each was desired. The new principle of life and motive to action was obedience: obedience absolute and unconditional, without a thought or question as to its object or consequences. Every member of the society had to resign himself, in total and blind submission to the will of his superiors, to be led 'like a thing without life, as the staff, for example, that the superior holds in his hand, to be turned to any purpose seeming good to him.' The love of kindred was denounced as a carnal inclination; all property had to be given up unreservedly for the benefit of the poor, and the members were not permitted to aspire to any higher rank, or to accept ecclesiastical dignities, for these 'might have involved the fulfilment of duties, or the forming of relations, over which the society could no longer exercise control.' As at first constituted, when it was complete, the society was composed of four grades of members: novices, scholars, coadjutors, and professed members. (1) In the general was vested for life the power of wielding the unquestioning obedience of the whole order. Being responsible to no one for the use made of it, he exercised a kind of Papal authority on a small scale. (2) The *professed* were those who have passed through all the preparatory stages, and have taken the four vows of the order. From them alone the general and higher officials could be chosen, such as superiors of provinces, colleges, and houses, who were all named by the general, and held office for three years. (3) But as the professed were all bound by their fourth and special vow to perpetual travels in the service of the Pope, the *coadjutors* were instituted; the *spiritual* to fill certain posts which required constant residence, such as the superintendence of colleges and provinces; the *secular*, or lay brothers, to take care of the alms which constituted the living of the professed in their houses, and of the revenues which the colleges were permitted to have. Both were bound only by the three vows of poverty, chastity, and obedience to the order, and that only as simple vows which in certain cases could be cancelled. (4) The *scholars*, or *scholastics*, were those engaged in the prescribed course of study or in teaching in the schools of the order. (5) The *novices* were those engaged in a two-years' course of religious exercises and ascetic practices preparatory to becoming scholastics.

The rapidity with which the order increased in numbers, and the extraordinary influence which it acquired among all classes of society, were due to several peculiarities. First, by the arrangements of the system for cutting off the members from all external obligations and relations, and for merging all individuality in a life of mutual supervision and subordination, a compact and perfect unity was formed. Secondly, by casting off the more ascetic and cumbrous forms of monastic devotion, excess in religious exercises was avoided, with the consequent deterioration of physical and mental energy, and the highest culture of the

faculties of each was as far as possible attained. Thus also they were left with more leisure and energy for performing what was regarded as their real work, namely, tending the sick, preaching, acting as confessors, and teaching. In education they followed a carefully-considered system, dividing the schools into classes, and pursuing in these a method strictly uniform. From paying great attention to the moral training they were favoured by the civil power, and, what helped greatly to fill their schools, all their instruction was gratuitous. Whenever one of their colleges was founded in a place no private person needed to incur any further expense in the education of his children. Then the best talent among the pupils was, if possible, appropriated for the order, and in this way an incalculable amount of influence was acquired wherever they had schools established. But, perhaps, the most direct and immediate source of their influence was the confessional. As confessors they have been described as the the most rigid and as the most indulgent of spiritual directors. Doubtless they were both the one and the other. In this, as in their whole system, the secret of their success lay in the knowledge of human nature they displayed, and the confessors could be strict or lax as best suited the temper of the penitent. Such is a sketch of the constitution of the society as first completely developed; a history of the J. would virtually be a history of the Roman Catholic Church (q. v.) since the Reformation. In the 17th c. great changes were introduced. The most important was that the 'professed' members had become advanced to the possession of power. (1) They took part, *e.g.*, in the management of the revenues of the colleges, and became rectors and provincials, offices which used to belong to the coadjutors alone. (2) By introducing the practice of associating a *vicar* with their general, they were able to depose their chief without any alleged offence on his part; thus subverting the fundamental principle of their system, obedience. (3) By siding with the house of Bourbon in their conflicts with Rome, they went against their supreme principle of obedience to the Pope. (4) Another principle really essential to the original constitution—that all worldly connections should be set aside—was also overturned, for now each wealthy member, when making a transfer of his property to the society, did so with the clear understanding that this was in favour of the particular college to which he had attached himself, and even frequently in such a way that he retained the management of it in his own hands. (5) They even devoted themselves to the acquisition of wealth by commerce. In short, the purpose of the society was not now what it had been, to subjugate the world and imbue it with the spirit of religion. On the contrary, their own spirit had been corrupted by the world, and all their aim and labour now was to aggrandise themselves. To maintain the influence which was now gradually slipping from their grasp, they not only modified and perverted the rules of the society, as described above, but even the doctrines of religion and the precepts of morality. In the 18th c. they were still powerful, being still the confessors of princes and nobles, and holding in their hands the education of the young; but they were in ever-increasing conflict with the new tendencies of the age. Their presence at the courts of Europe was becoming intolerable. Under various pretexts they were banished from Portugal in 1759, suppressed in France 1764, in Spain 1767, and afterwards in Naples, Parma, and Modena, and such was the pressure brought to bear by these courts upon Rome that in 1773 Pope Clement XIV. issued a bull, 'Impelled by the duty of restoring concord to the Church, convinced that the Society of Jesus can no longer effect those purposes for which it was founded, and moved by other reasons, we do extirpate and abolish the Society of Jesus.' The order, however, was not completely crushed by this suppression, but began to raise its head again at the beginning of the century, was re-established by Pope Pius VII. in 1814, and has been a powerful agent in all the subsequent policy of the Papacy. See Wolf's *Allgem. Gesch. der Jesuiten* (2d August 1803); Poynder's *Hist. of the J.* (Lond. 1816); Ranke's *Hist. of the Popes* (Eng. trans. Lond. 1850); Cartwright's *The Jesuits* (Lond. 1876).

Jesuits' Bark. See CINCHONA.

Je'sus, the Greek form of the Hebrew Joshua or Jeshua, a contraction of Jehoshua, 'help of Jehovah,' or 'Saviour,' was the name given to the founder of Christianity before his birth (Matt. i. 21). J., the son of a virgin, was born at Bethlehem (Luke ii. 4-6), according to the received chronology, in the year A.U.C. 754, but as he was born in the lifetime of Herod the Great (Matt. ii. 1), who is known to have died in the year A.U.C. 750, his birth was probably in the year B.C. 4. His crucifixion is generally placed in the year A.D. 33; if then the date of his birth given above be correct, he would have been in the thirty-seventh year of his age at the time. Almost the only source of information regarding the life of Christ is the New Testament, and especially the four Gospels. But there has been much discussion in modern times as to how far the Gospels are to be regarded as records of actual history, the fourth especially meeting with much hostile criticism. Various explanations of their existence in their present form have been given by modern biblical critics, and various pictures of J. have been drawn, according to the idea of the writers of what he must have been. Thus Strauss, in his *Leben Jesu*, undertook to show that not merely in the accounts of the infancy, but in most of the important supernatural events of the life of J., the only really plausible explanation is the mythical, that is, that mere opinions, or 'the wholly gratuitous fabrications of the imagination' had gradually come to be believed, and were put down as facts. Renan, in his *Vie de J.*, although accepting much more of the historical materials at his command as genuine, still produced a picture greatly modified from that ordinarily received, laying great stress on two points especially, namely, the gradual alteration which time and circumstances produced in the conceptions and language of J., and 'the manner in which miracles grew up, as it were, around the steps of every great prophet and reformer in the East.' We have two striking English pictures of Christ, one by the author of *Ecce Homo*, and another by Mr. Arnold in his *Literature and Dogma*; and the number will be increased indefinitely so long as each writer makes his own modification of the gospel history. The controversy regarding the authenticity and genuineness of the evangelical narrative is necessarily one of the profoundest interest and importance. Everything hangs upon it, and it is certain that all thoughtful believers—not merely erudite or eloquent theologians—will sooner or later have to weigh the evidence as it has never been weighed before. If the Gospels stand the test of impartial criticism, then the historical J. is not the myth of Strauss, but that Divine Redeemer in whom Christendom has trusted for 1800 years.

Jesus College, Cambridge, founded in 1496 by John Alcock, Bishop of Ely, and endowed with the possessions of the nunnery of St. Rhadegund, consists of a master (appointed by the Bishop of Ely) and of sixteen fellows, six of whom must be in orders. It has fifteen foundation scholarships of from £20 to £50; seventeen of from £40 to £50, founded by Tobias Rustat, for the sons of deceased, or in default of such, of living clergymen; seven close, and two open, scholarships. The college holds the presentation to sixteen livings. In the chapel, a cruciform structure, recently restored, is some fine painted glass. Cranmer, Flamstead, Hartley, Sterne, and Coleridge were students of J. C. In 1875 the number of undergraduates was 144.

Jesus College, Oxford, founded by Dr. Hugh Ap-Rhys in 1571, consists of a principal, thirteen fellows (seven of whom must be natives of Wales or Monmouthshire), and twenty-two scholars. It has also thirty exhibitions of £40 a year, and the presentation to twenty livings. In 1876 the college had thirty-six commoners and eleven members of Congregation. By 17 and 18 Vict. c. 81, one fellowship, founded by Charles I., was to be applied, on its next avoidance, to the maintenance of scholars from the Channel Islands, another to the purposes of the professoriate of the university, and four others to augment the number and value of the open scholarships. A Celtic chair was founded in 1876 by the principal and fellows of J. C., and by them endowed with £500 a year, the stipend being made up by £600 out of the university chest.

Jesus, Son of Sirach. See ECCLESIASTICUS.

Jet (Fr. *jais*, Old Fr. *jayet*, badly formed from the Lat. *gagātes*, see below), a lustrous mineral of a velvety-black colour, resembling glance-coal, found in thin scattered beds in the upper lias shale in Yorkshire, and in marly strata in Spain, France, and Saxony. Authorities are not agreed upon its origin. Some believe that it is bituminised wood or a variety of lignite; others that it is an indurated petroleum. It takes a good polish, and is easily carved. The production of personal

ornaments in J. is the staple industry of Whitby, one-third of the population of that town being directly supported by it. In 1863 the industry realised £55,000, and in 1873 upwards of £90,000. J., the *gagates* of the ancients, derived its name from the river Gagas, in Lycia, Asia Minor, where it was first discovered. It was formed into bracelets by the ancient Britons, and J. remains are common in Europe wherever the Romans have dwelt.

Jet'sam (Fr. *jeter*, 'to throw'), a legal term used to denote goods thrown into the sea. Till claimed by the owner such goods are the property of the Crown. See FLOTSAM and JETTISON.

Jett'ison is the legal term denoting the justifiable throwing overboard of a ship's cargo or of part of it. Occasion for J. occurs chiefly during a storm, or to prevent capture. The necessity for the measure must be determined by the master and a majority of the mariners. The owners of the ship and of the cargo saved are liable to the owners of the goods thrown out. See AVERAGE.

Jev'ons, William Stanley, an English political economist, was born at Liverpool in 1835, and educated at University College, London, where he graduated in 1862. In 1866 he was appointed Professor of Logic, Mental and Moral Philosophy, and Cobden Lecturer in Political Economy, in Owen's College, Manchester, and in 1875 received the honorary degree of LL.D. from Edinburgh University. He has written several pamphlets bearing upon questions of political economy, but is best known by his *Elementary Lessons in Logic* (1870), and *Principles of Science* (1874).

Jew, Wandering, is the subject of a legend which represents a Jew called Ahasuerus as compelled to undertake an eternal and unresting journey through the world, because he drove Christ from his door when he wished to rest from the toil of carrying his cross. The fiction has appeared in different shapes throughout various literatures. *Le Juif Errant* (1844-45), of Eugene Sue, a tale levelled at the Jesuits, is the most important outcome of the tradition in modern times. For the literature of the subject see Grässe, *Die Sage vom Ewigen Juden*.

Jewel (Fr. *joyau*; Old Fr. *jouel*, from the Lat. *gaudium*, 'a joy or delight'), is an article of personal ornament made of precious metals, as gold or silver, of any of the precious stones, or of these in combination.

Jew'el, John, an English Protestant divine, born 24th May 1522, at Berrynarbor, Devonshire, entered Merton College, Oxford, at the early age of thirteen, but migrated to Corpus, whence he took his B.A. degree in 1540, and became a tutor of that college. On the accession of Edward VI. J. openly professed the Reformed faith, which he had previously practised in secret, and he acted as secretary to Peter Martyr on occasion of a public discussion at Oxford between the latter and certain Catholic divines. In 1551 he took his B.D., and at the same time obtained the living of Sunningwell, Berks, only to lose it in 1553 on the restoration of Catholicism by Mary. A temporary recantation was followed by flight, and for four years J. lived in exile at Frankfurt and Strassburg, at the latter place acting as vice-master of a college founded by his old friend Peter Martyr. Returning home at Mary's death, he was made Bishop of Salisbury by Elizabeth in 1559, and in that position signalised himself by his animosity to the old religion, and specially by a challenge, issued in a sermon preached at Paul's Cross, to produce a single writer of the first six Christian centuries who held the tenets of the Roman Church. This led to a controversy between the Jesuit Harding and himself, in the course of which he published his *Apologia Ecclesiæ Anglicanæ* (Lond. 1562), which has been translated into six different languages. J. died at Monkton Farleigh, Wilts, 21st September 1571. His *Works* have been edited by Dr. R. Jelf (8 vols. Oxf. Clar. Press. 1847).

Jew'ellery consists of manufactured articles in precious metals, stones, and other valuable materials used for purposes of personal decoration. The material in which the jeweller works and the subdivisions of his trade are very numerous. Gold and silver, diamonds, emeralds, rubies, garnets, amethysts, pearls, coral, topazes, cairngorms, and agates, are among the principal materials used for J., and these mostly are dealt with in different ways by special artizans. The ornamental effect of the various stones is developed or heightened by cutting and setting in a particular manner, and the metals are enriched by chasing, engraving, inlaying, and enamelling. The J. of special countries and periods is very distinct in its character, and is found to be dependent for its peculiarities on the artistic development of the races fabricating it, and also on the nature of the materials at the disposal of the makers. Birmingham is at the present day the great emporium of the cheap J. trade. The manufacture of imitation J. in electro-gilt metal with imitation precious stones of 'straw' or 'paste' is known as the gilt toy trade (see GILT TOYS). A higher class of Birmingham manufacture consists of plated J. in which a thin plate of gold covers the copper or other base metal of which the body of the work is composed. J. is also made in Birmingham from a compound called 'common gold,' and which consists of only 7 parts of gold to 17 of alloy, while '9 carat gold' having 15 parts of alloy is a compound having the sanction of a hall mark, and which is more extensively employed than any other quality of gold. Scotch J., in which silver, agates, and cairngorms are the leading materials, is also an important feature in the Birmingham trade. The manufacturers of Clerkenwell in London compete with the Birmingham traders in the better class of trade J. Details regarding the J. manufacture will be found in Gee's *Practical Gold Worker* (Lond. Crosby, Lockwood & Co. 1877.)

Jewish Sects. Several lists of J. S. are given by Christian fathers. Epiphanius (*Hæreses*) enumerates seven: the Pharisees, Sadducees, Ossenes (Essenes), Hemerobaptists, Scribes, Nazaræans, Herodians. Hegesippus (Eusebius, *H. E.*) gives the same list, except the last three, for which he substitutes the Galilæans, Masbothæans, and Samaritans. Justin Martyr mentions (*Dial. c. Triph.*) six: the Sadducees, Genistæ, Meristæ, Galilæans, Hellenians, and Pharisee-Baptists. Of these some were not properly sects in the ordinary sense at all; they could only be described as parties in the nation following certain religious or political tendencies. The last period of the existence of the Jewish nation was materially affected by the rise of a most bitter party spirit, which actually contributed greatly to the dissolution of the nation. The peculiar phase of Israelitish patriotism had always been that they were 'a people dwelling alone' (Num. xxiii. 9). The ultra-development of this idea had been exhibited in the time of Judas Maccabæus by the *Chasidim* (q. v.). This party becoming dissolved, there remained a puritan party known as the *Essenes* (q. v.), and a moderate party represented by the *Pharisees* (q. v.). The Pharisees, so far from having been a sect, were simply the people, in contradistinction to 'the leaven of Herod,' the aristocratic, free-thinking *Sadducees* (q. v.). Regarding the *Herodian* party mentioned by the Evangelists (Matt. xxii. 16; Mark iii. 6, xii. 13) there is little information to be had. They seem at least to have belonged to the Sadducees, if indeed the two names be not synonymous (Matt. xvi. 6; *cf.* Mark viii. 15). It has been supposed that they were the Galilean party who were eager to get the honour of royalty for Herod Antipas. The *Galilæans* were the followers of Judas of Gamala, who, when Archelaus was banished (A.D. 6), Judæa incorporated into Syria, and the Roman census introduced (*cf.* Acts v. 37), called the Jews to arms in defence of their liberties. The *Zealots*, who were so prominent during the years 66 to 70, were the same party. Holding it to be unlawful to submit to or pray for a foreign prince, they desired to be zealous for the honour and service of the God of Israel, like Phinehas the grandson of Aaron (Num. xxv.), and Mattathias at Modin (1 Macc. ii. 23). The *Hemero-Baptists* in the above list of Epiphanius, probably the same as the Pharisee-Baptists of Justin's list, were so called from their daily ablutions, and were evidently akin to the Essenes. The *Nazaræans* (Heb. *netzer*, 'a branch') of Epiphanius' list, perhaps the same as the *Genistæ* (properly *genitæ*, from Gr. *genos*, 'stock') and *Meristæ* of Justin's list, professed to be primitive Jews of the true stock. Justin's *Hellenians* were probably the Herodians. The *Masbothæans* were an obscure sect of free-thinkers who denied the providence of God and the immortality of the soul! not Sabbatarians as they are erroneously represented by some writers to be. The *Gorthæans* are described by Eusebius as a sect founded by Gorthæus, a follower of Simon Magus. See KARAITES, SABBATHAIS ZEDI.

Jews (Heb. *Jehudim* 'Judæans') was the name originally applied to the inhabitants of the kingdom of Judah, after the

revolt of the ten tribes under Jeroboam (*cf.* 2 Kings xvi. 6). After the Captivity, as the majority of those who returned to Palestine belonged to the old kingdom of Judah, the name was applied to the whole nation, and even extended to those scattered abroad (*cf.* Dan. iii. 8; Esth. iii. 4). The history of the J. might conveniently be divided into several periods:—(1) The first, down to the settlement in Canaan; (2) from the settlement in Canaan to the beginning of the monarchy; (3) from the reign of Saul to the Babylonish Captivity; (4) from the Captivity to the destruction of Jerusalem by Titus; and (5) the modern period, from the destruction of Jerusalem to the present time.

First Period.—According to Gen. x. 22 (*cf.* xi. 10–32) the five sons of Shem were Elam (Elymais, on the Persian Gulf beyond the Tigris), Asshur (the Assyrians), Arphaxad (Arrapachitis, the most northerly country of Assyria: Ptolemy), Lud (the Lydians of Asia Minor), and Aram (the Aramæans). From Arphaxad, the centre of the whole region occupied by those Semitic tribes, at some pre-historic period, some families emigrated westwards to the higher Mesopotamia [Gen. xi. 31: Arphaxad = *Arph-casd* = *Ur Casdim*, Heb. for Ur of the Chaldees]. A part of this colony settled there (in Haran), another part passed on to the S.W. towards the coast of the Mediterranean. Branches of them called the Moabites and Ammonites, settled to the E. of Canaan; another, Edom, took possession of the mountains of Seir, S. of the Dead Sea; other two, Midian and Ishmael, pushed farther to the S. into the Arabian peninsula (Gen. xxv.); and the branch of the Hebrews crossed the Jordan into Canaan under the conduct of Abraham (q. v.: Gen. xii.). The Hebrews having been greatly strengthened by the arrival of another company from Haran under the conduct of Jacob (q. v.: Gen. xxxv.), continued their wanderings still farther to the S.-W., and settled in the Land of Goshen in the N.-E. of Egypt, where they found rich pasture for their cattle, and whither, in fact, a family of the tribe (Joseph) had already found its way (Gen. xlvi., xlvii.). It is a difficult matter to determine the exact date of the arrival of the Israelites in Egypt, or the length of their stay, but there are distinct traces in Egyptian history of a Shemitic invasion. About the year B.C. 2100 Shemitic hordes from Central Asia invaded the eastern Delta, and seized the kingdom of Memphis, driving the native kings to the S. For more than 400 years these foreign conquerors, called on the monuments *Amu* ('shepherds of oxen'), *Aadu* ('detested, wicked ones'), and their kings *Hykshos* (*hyk-shasu*, 'ruler of shepherds'), held the country in subjection. But about B.C. 1660 Upper Egypt, which had been tributary, rose against them, and regained its independence; and about B.C. 1580 king Thutmosis, taking their fortified camp at Tanis (Avaris) on the E. of the Nile, drove them from the country. Josephus tries to identify the Hykshos with his countrymen, but it seems incredible that, if the Israelites had ever actually held possession of Egypt, there should have been no tradition of it among them. It is much more probable that they are intended by 'the lepers' (all foreigners being unclean to the Egyptians) described in the other fragment of Manetho preserved by Josephus. The Exodus (q. v.) probably took place about the year B.C. 1320, or, according to the ordinary chronology, about 170 years earlier. All danger from the Egyptians being removed, as soon as the Red Sea was passed, the Israelites set out along the shore of that sea towards Mount Sinai, their wants being supplied on the way thither by Manna (q. v.), quails, and water—first the bitter water of Marah (q. v.), sweetened by a certain tree (Exod. xv. 25), and then from the rock in Horeb (q. v.: Exod. xvii. 1–7). At Rephidim they defeated the Amalekites, who attacked them (Exod. xvii. 8–16), and there they were visited by Jethro the priest of Midian, and father-in-law of Moses, by whose advice the administration of justice was improved (Exod. xviii.). But the most glorious manifestation of the presence of Jehovah was on Sinai (q. v.), where the law was delivered to Moses, and a covenant made with Israel (Exod. xix., xx.), the people being nevertheless engaged at the very time making and worshipping the image of a bull, probably an idolatrous representation of Jehovah himself (Exod. xxxii.). At the end of two years from the time when they left Egypt they arrived at the southern frontier of Canaan, but finding that this fertile country was held at the time by fierce and gigantic tribes, they were afraid to attempt the invasion of the country, and turned back to continue their nomadic life in the desert (Num. xiii., xiv.). Little is recorded of their life during the next thirty-eight years; almost the only particular being the rebellion of Korah, Dathan, and Abiram against Moses and Aaron (Num. xvi., xvii.). In the fortieth year from their leaving Egypt the Israelites again approach the land of Canaan, this time on the eastern frontier, and a great number of most important events follow in rapid succession, in fact seem to be crowded into an incredibly short space of time—the last seven months of this year. On the first day of the fifth month Aaron dies on Mount Hor (Num. xx. 22–29, xxxiii. 38). That month being spent in mourning for Aaron, the Israelites march round Edom, defeat Sihon, king of the Amorites, and Og, king of Bashan, and fraternise with the Moabites long enough to take part in the unchaste worship of Baal-peor (Num. xxi.–xxv.). Moses having died in the land of Moab (Deut. xxxiv.), they are led into Canaan by Joshua (q. v.) about B.C. 1280, and in two battles that able general completely crushed the resistance of the inhabitants (*cf.* Josh. ii. 9–13, ix. 24), after which he took their towns one after another with little difficulty (Josh. i.–xxiv.).

Second Period.—The account of the rapid and comparatively easy conquest of the country by Joshua is considerably modified by the picture of the state of the country given in the Book of Judges, from which it appears that the Canaanitish tribes were very far from being completely subdued centuries after the death of Joshua. The period of the Judges was the period of the first formation of the nation. The tribes had now exchanged their nomadic life for that of agriculturists, and they were brought into contact with two nations in particular—the Phœnicians and Philistines—both in a more advanced state of civilisation than themselves. The Phœnicians, entirely engrossed with trade and commerce, were peaceful neighbours. The Philistines, on the other hand, with their five chief cities, Gaza, Askelon, Ashdod, Gath, and Ekron, were a warlike nation, and proved themselves very troublesome neighbours. But even in the interior of the country, besides the Gibeonites, who made a treaty with Joshua for the peaceful possession of their towns (Josh. ix.; *cf.* 2 Sam. xxi. 1–4), many of the inhabitants remained unsubdued and independent. Jebus was not taken till the reign of David (2 Sam. v. 6–9; *cf.* Jud. xix. 10–12), and Gezer not till the time of Solomon (1 Kings ix. 16). Others, again, of the Canaanites proper, as well as from among the neighbouring nations, allied themselves with the Israelites, or even became amalgamated with them: *cf.* Jud. i. 16, Caleb the Kenezite (Josh. xiv. 6–15), Heber the Kenite (Jud. v. 24), Doeg the Edomite (1 Sam. xxi. 7), Amasa the Ishmaelite (2 Sam. xvii. 25), Ittai the Gittite, *i.e.*, a Philistine of Gath (2 Sam. xv. 19–22), Ahimelech and Uriah the Hittites (1 Sam. xxvi. 6, 2 Sam. xxiii. 39), Zelek the Ammonite (2 Sam. xxiii. 37), Ithmah the Moabite (1 Chron. xi. 46). That there was yet no proper unity in the nation is clear from the fact there was a jealousy and rivalry among the tribes so strong as sometimes to produce war between them (*cf.* Jud. viii. 1–7, xvii.–xxi.), and that the wars which almost always brought calamity only on single tribes, were regarded with indifference by the rest of the tribes, the deliverance being generally effected by an alliance of one or two. The following is a summary, according to the book of Judges, of the nations by which parts of the country were conquered and held in subjection for a time, and the judges by whom the foreigners were defeated: I. King of Mesopotamia, 8 years servitude: Othniel, 40 years of peace. II. Moabites, 18; Ehud, 80. III. Philistines: Shamgar. IV. Canaanites, 20; Deborah and Barak, 40. V. Midianites, 7; Gideon, 40; Abimelech, 3; Tola, 23; Jair, 22. VI. Ammonites and Philistines, 18; Jephthah, 6; Ibzan, 7; Elon, 10; Abdon, 8; Philistines, 40; Samson, 20 (probably meant to be included within the 40 of servitude); Eli, 40 (perhaps partly or altogether synchronous with the 40 years' oppression by the Philistines; interregnum, 20; Samuel). The so-called 'Judges' might for the most part more properly be called warriors or heroes. The first who deserved the name was Eli, in whose person was united the offices of judge and priest, which was the first step towards the establishment of a monarchy. It began to be apparent to all the tribes that unless the state of disunion and rivalry which had prevailed so long was put an end to, they would never be able to hold their own against the surrounding tribes, and that their only hope of maintaining their existence as a nation was to have a king like the neighbouring nations. More than one attempt had been made to introduce the regal form of government during the period of the Judges

(*cf.* viii., ix.), but unsuccessfully, because prematurely. Gideon doubtless expressed the sentiments of the majority at the time when he declared that the evils of a monarchy were greater than its advantages; and the parable of Jotham expresses unbounded contempt for that form of government. But the national mind was clearly advancing in that direction, and at last it was resolved that they would have a king, notwithstanding the protestations of Samuel (q. v.). That prophet represented the old conservative spirit of the nation, according to which Jehovah was their king; from which idea this period at the close of which Samuel stands has been called the Theocracy. The choice of a king was hurried on by the successes of the Philistines. The Ark of the Covenant (q. v.), which had been carried into battle as the symbol of the Divine presence, was captured by them, and the sanctuary at Shiloh, in which the ark had been kept since the conquest, seems to have been destroyed.

3. *Period of the Monarchy.* At this crisis of the national life, the nation possessed in Samuel a notable leader and adviser. The last of the Judges and the first of the Prophets (q. v.), he was the inaugurator of the first of the kings, Saul the son of Kish, of the tribe of Benjamin, who began to reign about B.C. 1100. Having inaugurated his reign by defeating the Ammonites, who were threatening the people of Jabesh-Gilead, kindred of the Benjamites, he next attacked the Philistines, and carried on the war against them so vigorously and successfully that they were driven out of the country for a time. After the defeat of the Philistines, instead of disbanding his army, he assumed an offensive attitude towards the tribes who had formerly proved themselves hostile and troublesome, and making war on the Moabites, Ammonites, Edomites, the kings of Zobah, and the Amalekites, he 'vexed' them all. It is thus clear that under his rule Israel became a united and formidable nation. The nucleus of a standing army was formed (1 Sam. xiii. 2, xiv. 50, 'host'), and a bodyguard established (xvi. 15, 17). A new sanctuary also was established at Nob (xxi. 1). But Saul fell short of the zeal which was thought to be necessary by Samuel and the prophets and Nazarites (q. v.), produced by the religious revival which he had awakened. According to them religious reformation, zeal in the worship of Jehovah, was the one road to national prosperity, and therefore everything Canaanitish and heathenish must be rooted out, cost what it might. For a time Saul ruled entirely in this spirit (*cf.* 1 Sam. x. 9–12); he persecuted the necromancers and wizards (1 Sam. xxviii. 9), raised altars to Jehovah, and would not have hesitated to sacrifice his own son in fulfilment of a vow. Whether it was that latterly his heart revolted against the wholesale bloodshed involved in carrying out this spirit, he began to display a milder policy, and from this time, although the great mass of the people remained faithful to him, he was opposed by Samuel and his party. Saul having failed in this way, Samuel anointed as his successor one who was to be 'a man after God's own heart,' David (q. v.), the son of Jesse, of the tribe of Judah. On the death of Saul, who fell in battle against the Philistines at Mount Gilboa, the greater part of the tribes of Israel remained faithful to his son Ishbosheth, who, a feeble man himself, was supported by his courageous cousin Abner, and established himself at Mahanaim beyond Jordan. David was proclaimed king by his own tribe, and made Hebron his capital. On the death of Ishbosheth, two years after, David was acknowledged as king by all the tribes. Some time after he took the stronghold of Jebus, and after reigning seven years and a half at Hebron removed to Jerusalem (q. v.), and by bringing thither the Ark of God made it the religious capital of the country. The reign of David (1058–1018) was upon the whole marked by great prosperity. He was almost invariably successful in his wars—against the Philistines, Moabites, Ammonites, Edomites, and Syrians (2 Sam. viii., x.; 1 Chron. xviii., xix.)—and extended the boundary of his kingdom towards the N. and the E. At home he was surrounded by a royal state quite unknown in the time of Saul. The military organisation of Saul was greatly developed by David. (1) All males capable of bearing arms had to be in training for a month yearly in time of peace, being divided for that purpose into twelve divisions (1 Chron. xxvii. 1–15). (2) There was also a small standing army, the nucleus of which was the band of 600 men who had gathered round him before the death of Saul (2 Sam. xxiii. 8–39, 1 Chron. xi. 10–47); and (3) a body-guard, nominally at least composed of foreigners—'the Cherethites and the Pelethites (Cretans and refugees: Stanley; 2 Sam. viii. 18). New arrangements were also made in connection with pastoral, agricultural, financial, and judicial matters (1 Chron. xxvi., xxvii). But the most notable of David's institutions were the religious. Two prophets—Gad and Nathan—acted as his advisers (2 Sam. vii., xxiv. 11). There were also two high-priests, Abiathar and Zadok, subordinate prophets especially trained in music (1 Chron. xxv.), and Levites (1 Chron. xxvi.). At the head of the whole was David himself as Prophet, Priest (2 Sam. vi. 14, 17), and Psalmist. As the conqueror of his country's enemies, the administrator of justice, and the religious guide of his people, David might well seem in their eyes the 'light' of Israel (2 Sam. xxi. 17); and in after times David's reign was looked back to as the golden age of the nation's history. Even Solomon's reign (B.C. 1018–978), with all its glory, was regarded with far less admiration than David's. He could perform miracles of wisdom, had immense wealth, built a magnificent Temple (q. v.) for Jehovah, besides a splendid palace, and altogether his magnificence was something unparalleled even in the East; but all this was too much at the expense of the people to be gratefully or very admiringly remembered. His subjects were heavily taxed and obliged to serve for little at his great works. Besides, the national glory abroad was tarnished (*cf.* 1 Kings ix. 10–14, xi. 14, 23). The discontent which had been openly expressed even in the lifetime of Solomon (1 Kings xi. 26–40) exploded altogether owing to the obstinacy of his successor Rehoboam; and eleven of the tribes, headed by Ephraim, formed an independent kingdom under Jeroboam, which received the name of the kingdom of Israel, while the tribe of Judah, and it alone, remained faithful to the house of David under the name of the kingdom of Judah. Although the nation of the J. was really perpetuated through the kingdom of Judah, with which also the prestige of the house of David remained, so that the ordinary impression, which indeed is conveyed in the history, is that that kingdom represented the nation, yet in reality the kingdom of Israel was to a great extent the kingdom of the whole nation. At the death of Saul Ishbosheth was made king over *all* Israel, and David only over the tribe of Judah (2 Sam. ii. 4, 8, 9); and so it was at the death of Solomon with Jeroboam and Rehoboam (1 Kings xii. 20). The kingdom of Israel still extended from the Mediterranean to the Euphrates, and from the extreme N. to the frontier of Judah. Even the tribes of Simeon and Benjamin, which were almost enclosed within Judah, did not give their undivided allegiance to that tribe. In the historical books the disruption under Jeroboam was as much a thing from the Lord as the establishment of the monarchy had been (1 Kings xi. 31–39); Jeroboam was supported by the prophets Shemaiah and Ahijah, as David had been by Samuel. However, nearly the entire history of the kingdom is made up of bloodshed and confusion. In the 254 years of the monarchy nine different families occupied the throne, and according to the historian not one of the nineteen kings was free from the general charge of depravity. Of one after another, it is said, 'he did that which was evil in the sight of the Lord.' Pekah made an alliance with Rezin, King of Syria, against Ahaz, King of Judah. Ahaz thereupon applied for help to Tiglath-Pileser, King of Assyria, who conquered Israel, carrying away the two and a half trans-Jordanic tribes, and making the rest tributary (B.C. 738). Ten years later Hoshea revolted from Assyria, which brought Shalmaneser, the son of Tiglath-Pileser, upon him; Samaria was taken, and the ten tribes were carried off to Assyria (B.C. 721), and never more heard of. During the 388 years that the kingdom of Judah lasted, twenty kings, all of the house of David, occupied the throne, six of whom—Asa, Jehoshaphat, Uzziah, Jotham, Hezekiah, and Josiah—are mentioned with special praise, while several, *e.g.*, Jehoram, Ahaz, Manasseh, and Amon, are described as excessively wicked. Ahaz, as we have seen, sought the aid of Tiglath-Pileser, the bitter fruits of which alliance he and his successors reaped. It cost himself a heavy tribute, Hezekiah most of his treasury, Manasseh his liberty, and Josiah his life. Jehoahaz was carried captive to Egypt, Jehoiakim was deposed by Nebuchadnezzar, as was his son Jehoiakim, who was carried off to Babylon. Zedekiah his successor having revolted, Nebuchadnezzar came a third time against Jerusalem and took it. The city was burned, the temple destroyed, and the greater part of the nation carried off to Babylon (B.C. 587).

Fourth Period, from the Captivity to the destruction of Jeru-

salem.—When the decree of Cyrus was issued (B.C. 536, Ezra i.) permitting the J. to return, an expedition numbering 42,360 returned to Palestine, and although they settled at first in the towns they belonged to they soon afterwards assembled at Jerusalem and commenced the rebuilding of the temple (Ez. iii.), which was finished in the year B.C. 516. The wall of the city was rebuilt (B.C. 445), in spite of the opposition of Sanballat and Tobias (Neh.ii.-vi.), who were leading men among the Samaritans (q. v.). After the time of Nehemiah (B.C. 420) Judea continued for nearly a century subject to Persia, as part of the satrapy of Syria, the government being entrusted to the High Priest, subject to the control of the Syrian governor. When the Persians were conquered by Alexander the Great (B.C. 331) it fell into the power of that monarch. Whatever truth there may be in the story of Alexander's visit to Jerusalem (Jos. *Ant.* xi. 8, 4), when he built his city of Alexandria he placed in it a great number of J. and gave them the same privileges as his Greek subjects. After Alexander's death (B.C. 323) Judea ultimately fell to Ptolemy Lagus as part of the monarchy of Egypt (B.C. 301), and by the encouragement given to the people to settle there, Egypt became an important seat of the Jewish population. At Jerusalem the prosperity of the J. was much promoted by the administration of the excellent High Priest, Simon the Just (died B.C. 291), who repaired and fortified the city and temple. After being tributary to Egypt for about a century, Judea next became subject to Antiochus the Great, King of Syria (B.C. 198), although the government still remained in the hands of the High Priest and a national council. The country was now divided into the five provinces of Galilee, Samaria, and Judea in the W., and Trachonitis and Peræa on the E. of the Jordan. Being situated between Syria and Egypt it was greatly harassed by the frequent wars between these two countries. But to the conservative, patriotic part of the nation, what appeared to be the greatest danger of the time was that Judaism would give way before the Hellenic influences introduced by their Syrian rulers, that the nation would cease to be 'a people dwelling alone' (Num. xxiii. 9), and become simply a part of the Syrian empire. There was a party with Hellenic tendencies in the nation itself. Thus in the time of Antiochus Epiphanes (B.C. 175) the High Priest Joshua did everything in his power to introduce Greek manners among the people, *e.g.*, by establishing a gymnasium at Jerusalem, sending a contribution to the games held at Tyre in honour of Melkarth, &c. Antiochus, seeing danger to his own authority during his wars with Egypt in the commotions which were produced by struggles for the possession of the high priesthood, came with an army to Jerusalem and plundered it (B.C. 169). Two years after an army of 22,000 men under Apollonius entered the country, and the obvious aim of all his proceedings was to obliterate the individuality of the nation by destroying the national religion. Taking Jerusalem, with a terrible massacre of its inhabitants, he prohibited all sacrifices, festivals, and rites in honour of Jehovah. And not only so, but an altar to Jupiter Capitolinus was erected upon the altar of burnt-offering in the temple, the worst of all being that a number of the people joined in the heathen rites (1 Macc. i.). But the national spirit was not to be so easily crushed. The opposition, at first passive, many allowing themselves to be tortured and put to death rather than take part in the heathen worship (1 Macc. vi.-vii), broke into open rebellion at Modin. At that place the people, roused by an old priest Mattathias, attacked and slew the officers of Antiochus, who were offering sacrifices. The little band who fled to the wilderness gradually increased, and on the death of Mattathias (B.C. 166) was commanded by his son Judas, surnamed Maccabæus ('the hammer'). After a series of brilliant victories, Judas was able to take possession of Jerusalem and the temple (B.C. 164), although a Syrian garrison continued to hold the stronghold (Acra) built by Apollonius. The temple was consecrated anew to the service of God, and the daily sacrifices resumed on the same day (25th December) on which, three years before, the first sacrifice to Jupiter Capitolinus had been offered; and this restoration was afterwards celebrated by the Feast of the Dedication (*cf.* John x. 22). After various vicissitudes, Judas being killed in the disastrous battle of Eleasa (B.C. 160), the independence of the J. was finally acknowledged by the Syrian king (B.C. 138). Under the Asmonæan princes, as the family of Mattathias were called, Judea became a free state, supported by regular troops, and forming alliances with other powers, even with Rome herself. But in B.C. 63 Pompey seized the pretext of the war between John Hyrcanus and his brother to make himself master of Jerusalem, although the independence of the J. was ostensibly respected. In the year 37 B.C. Herod the Great (q. v.) took Jerusalem from Antigonus, the last of the Asmonæan princes, and established himself King of the Jews, tributary to Rome. Under Herod the Jewish state again rose into importance and respect. He at least perpetuated his fame, although he could not conciliate the people, who hated him as a foreigner and a sycophant at Rome, by replacing Zerubbabel's temple by a much more magnificent structure. Just before his death (B.C. 4) there occurred the greatest event in Jewish history, although they themselves do not recognise it as such, namely, the birth of Jesus (q. v.). The Roman yoke was no less hateful to the J. than every other foreign dominion had been, and, aggravated by the misgovernment of various rulers, became every year more intolerable. In A.D. 6, when Judea, with Samaria, was incorporated with the Roman empire as a subdivision of the province of Syria, a rising had taken place under Judas of Gamala (See JEWISH SECTS; Galileans, *cf.* Acts v. 37), and at last under Gessius Florus the whole nation rose in revolt (A.D. 66). They at first met with some success, but were hopelessly weakened by being divided into parties which fought against each other. In fact, the real clew to the history of the J., from before the time of Antiochus Epiphanes till the fall of Jerusalem, is the existence of a bitter party-spirit. The body of the people, the true leaven of the J., under the influence of the Scribes or expounders of the law, were utterly opposed to all foreign relations whatsoever. Hence they continually resisted the policy of the more tolerant priestly aristocracy, with their foreign leanings, such as those of the High Priest Joshua, who Græcised his name to Jason. Under the Asmonæan princes the two classes came to be known as the parties of the Pharisees (q. v.) and Sadducees (q. v.), whose general political tendencies were those just described. Thus, when the war broke out, there was a peace party and a war party, the latter composed of zealots, who scouted the idea of all compromise, and were resolved to gain their freedom or perish. As there belonged to the latter party a band of assassins ready to put out of the way all opposed to them, and the party itself was divided into two factions, when Jerusalem was invested by the Roman army, the streets ran with the blood of J. slain by their own countrymen. By the fall of Jerusalem (A.D. 70), and the burning of the temple, not only the war, but the existence of the J. as a nation was virtually at an end; the most of those who had not been killed were scattered among the nations.

5. *Modern Period.*—Some convulsive struggles of the dying nation appeared in risings under Trajan (98–117) in Africa, Cyprus, and Mesopotamia, and under Hadrian in Palestine (130: see BAR-COCHBA). After the suppression of this last insurrection the final dispersion of the J. from Palestine was made. Hadrian, desiring completely to obliterate Jerusalem, built on its ruins a Roman city, with a temple to Jupiter Capitolinus, to which he gave the name of Ælia Capitolina, and which the J. were forbidden to enter on pain of death. (See JERUSALEM.) Under Antoninus Pius the scattered remains of the nation were restored to their privileges and permitted to form establishments in the different Roman provinces, to acquire the freedom of Rome, and enjoy municipal honours. The patriarch, who had fixed his residence at Tiberias, was empowered to appoint subordinates, and to receive an annual contribution from his dispersed brethren. These were allowed to erect synagogues in many cities, and openly to celebrate their festivals; and as a rule they settled down into peaceable and industrious subjects. Their enthusiasm was roused by the permission given by the Emperor Julian to rebuild the temple. Assembling from all the provinces of the empire they commenced the work (362), but the attempt was defeated by an earthquake, a whirlwind, and a fiery eruption from the ground (see Gibbon's *Decline and Fall*), regarded as a judgment of God on the impious attempt of Julian to falsify the predictions of Christ (Matt. xxiv. 2). Church historians mention the conversion of many J. to Christianity from the 4th c. onward; but the fact does the Christians little credit, for in almost every case they merely submitted to the rite of baptism to save themselves from fierce persecution or from death. Thus in the 5th c. 540 were baptized in Minorca, after their synagogue had been burned and themselves driven to starve among the rocks. The kings of Gaul and Spain by similar means compelled great numbers to submit to baptism, sometimes incited

thereto by the bishops, although sometimes against the wish of the Roman pontiffs. The same policy was followed by the Byzantine Emperor Heraclius (610–641). Many of the J. had settled in Arabia, where they were allowed to remain in peace till the time of Mohammed. That prophet did all in his power to gain them over to his opinions; the new religion, in fact, having much in common with the Jewish. But although he gained a few converts the majority repelled his advances. He thereupon attacked them, and those who were not killed were driven from the country and sought refuge in Syria. To return to Europe, in the 11th c. great sufferings were inflicted on the J. by the first armies of the Crusaders, who in their wanderings through Europe everywhere put to death with horrid cruelty those who would not submit to baptism. And from this time they were constantly exposed to explosions of popular fury. It gradually came to be understood that the J. had no *rights*; and only by special permission from the sovereign, for which they had to pay heavily, and under severe restrictions, were they allowed to reside anywhere. Often too the measure was adopted of banishing them completely from the country unless they embraced Christianity by a certain time. In this manner they were driven from England (1290), and more than once from Italy, Germany, France, Spain, and Portugal; an honourable exception to this intolerance being shown by Holland, where many of them found an asylum. When the Black Death visited Europe (1348–49) the cruelties to which the J. were subjected in the outbreak of fanaticism at the time (see FLAGELLANTS) are described as having been quite unparalleled. In Spain, 200,000 were compelled to undergo baptism in 1391, and as many lost their lives. Relief came in the 18th c. The oppressive laws against the J. began to be repealed, Friedrich the Great having had the honour of beginning the reform. In 1750 he enacted certain measures for their relief in his dominions; in 1791 they were acknowledged as citizens on taking the oath of allegiance; and in Germany they are now almost, if not altogether, on an equality with Christians. In other countries the reform has been so slow, that even yet there are some remains of the former oppression. In Great Britain, by statutes passed in the present reign (Victoria), the J. are on the same footing as British subjects, with the exception that a Jew *may* be excluded from the Houses of Parliament by the wording of the oath of allegiance, which contains the clause, 'I make this declaration upon the faith of a Christian,' and is especially excluded from several of the highest offices of State. These are specified at the close of this article in the paragraph entitled *Law Regarding Jews*.

Religion.—Having sketched the outward facts of their history, it will now be necessary to take a brief review of the religion of the J., with which their history is so intimately connected. The religion of the J. is generally regarded as having been a pure Monotheism from the time of Abraham, but it is now contended by many Biblical scholars that this conception of the Deity was not held by the people generally till a comparatively late period of their national existence, that at an earlier period they were Polytheists, and that the worship of their national god, Jehovah, was a higher kind of nature-worship, similar to that of the kindred Semitic tribes, Ammon, Moab, &c., and included even human sacrifices. The following are some of the considerations on which this position is maintained. First of all, in order to understand what was the primitive form of the religion of the J., it is most essential to remember that they were not an isolated nation in the midst of aliens, but simply one of the branches of the Semitic migration which flowed down towards the Levant from Central Asia, so that they were akin, as in language and manners, so also, it cannot be doubted, in religion to the Ammonites, Moabites, Edomites, and other branches which settled on the E. and S. of Canaan, and more remotely with the coast-tribes, the Phœnicians and Philistines. It is contended, then, that the Shemites generally were Polytheists, and that the Hebrews were no exception. The religion of the kindred tribes around Canaan was a higher kind of nature-worship. Their gods were the rulers of nature. Molech (Heb. *melech*, 'king,' *i.e.*, 'of heaven') or Milcom of the Ammonites (1 Kings xi. 5, 7), and Chemosh of the Moabites were sun-gods, representing the terrible and destructive aspect of nature, and propitiated with human sacrifices (2 Kings iii. 27). But the fertilising, productive power of nature was also worshipped as Baal ('Lord,' *i.e.*, 'of heaven'), in connection with which there was a duality of deities, the male and the female. Along with Molech, represented with the head of a bull, was Astarte, the moon-goddess, represented by the horns; along with Baal was Ashera (q. v.: *cf.* 1 Kings xviii. 19); and the nature of the rites of Baal-peor is well known (Num. xxv.). Now, in the first place, there is abundant evidence that these gods of the surrounding nations were at least occasionally worshipped by the J. down to the Babylonish captivity. Although this worship was denounced by the prophets, and attempts made to root it out by several of the kings, these denunciations and more or less successful attempts only prove how extensive was the evil they sought to counteract. In the reign of Solomon, Ashtoreth, Milcom, Chemosh, and Molech were worshipped at Jerusalem (1 Kings xi.). The worship of Baal was the established religion in the kingdom of Israel in the time of Ahab, and kept its hold, notwithstanding the work of Elijah, till the fall of the kingdom (2 Kings xvii. 16, 17). In the kingdom of Judah the worship of Molech was practised to a great extent, especially in the reigns of Ahaz, who established a place for sacrificing children to him in the Valley of Hinnom, setting the example by offering up his own son (2 Kings xvi. 3; 2 Chron. xxviii. 1–4), and of Manasseh (2 Kings xxi. 1–6). The work which Josiah had to do in his reform shows to what an extent the people had given themselves up to this worship; but, at anyrate, it is maintained, there is enough of evidence to show that Molech, Baal, and the rest were, during considerable periods of history, regarded as deities as well as Jehovah. That the primitive stock in Ur of the Chaldees were Polytheists, as well as the Hebrews at least till they left Egypt, is expressly mentioned (Josh. xxiv. 2, 14; Ezek. xx. 5, 8; *cf.* Gen. xxxi. 30; xxxv. 2). The next question is, was there any resemblance between Jehovah, the national God of the J., and these other gods; and it is maintained that the very fact of his being regarded as one of the Semitic deities, three or four of whom could be worshipped at the same time along with himself, implies a certain similarity between Jehovah and them. It is also pointed out that the golden image of a young bull, which Aaron called the god who had brought them out of Egypt (*cf.* Ps. cvi. 20, which says they changed 'their glory,' that is, their god, 'into the similitude of an ox'), and before which Aaron built an altar, proclaiming to the people 'To-morrow is a feast to Jehovah' (Exod. xxxii. 1–6), has a remarkable resemblance to the bull-headed Molech. Still more remarkable than this image were those set up by Jeroboam at Dan and Bethel, regarding which he used the very language which Aaron had used of his one. Now the kingdom of Israel was the national kingdom, and there cannot be a doubt that Jeroboam intended to establish in his kingdom the national religion, although it was in such a sensuous form as to be condemned by the prophets who had supported him. His act was intended as a piece of deep policy (1 Kings xii. 28: he 'took counsel'), and setting up the two sanctuaries would have had the effect he intended if they were for the same worship as obtained at Jerusalem, but not otherwise. There might have been some meaning in his establishing the worship of Baal, Molech, or some of the other Semitic gods, for worshipping whom the ten tribes had been rent from the house of David (1 Kings xi. 31–34); that would have afforded them a rival attraction to Jerusalem. But as that is evidently not what is meant, the explanation generally given is that the bulls were images of the god Apis, with whom Jeroboam had been familiar while in Egypt, and to whose worship it is presumed the Israelites would also take quite readily. But, not to mention that the god Apis was always in the form of a living bull, and the improbability of Aaron and Jeroboam declaring that the people owed their deliverance from Egypt to an Egyptian god, it seems incredible that nine-tenths of the nation should all at once have adopted the worship of a god utterly unknown to them, in preference to any Semitic deity. At anyrate we must conclude that the worship at Dan and Bethel was either totally strange to the people, or else was closely akin to that of Solomon's temple, in which there was a four-*horned* altar and a brazen sea supported by twelve brazen oxen. It has been mentioned that the other Semitic deities were worshipped even with human sacrifices, and it is maintained that there are several tolerably clear hints and allusions which show that the practice was not unknown in the worship of Jehovah. The narrative of Abraham's offering (Gen. xxii.) is unintelligible unless the idea of such sacrifices had been a familiar one to him. Jephthah actually sacrificed his

child to Jehovah (Judg. xi. 30, 31, 39); Samuel hewed Agag in pieces before Jehovah (1 Sam. xv. 33); David and the Gibeonites sacrificed seven of the sons of Saul to Jehovah (2 Sam. xxi. 1-6); and it seems to have been part of the worship at Bethel under Jeroboam (Hosea xiii. 2, 'sacrificers of men'). The rite of circumcision is also supposed to be a relic of the practice of human sacrifices. A trace of the same thing is found in the law which gave to Jehovah the first-born of man as well as of beast, the former being redeemed by paying a sum of money to the priest (Exod. xiii. 1-16). It is pointed out that other traces of nature-worship appear in the close connection between their festivals and the seasons: the three chief were the Easter Feast (see PASSOVER) and the Feast of Harvest, at which the first-fruits were offered to Jehovah, and the Feast of Ingathering (Exod. xxiii. 14-17); in the great importance attached to the *moon* or month: the Feast of the New Moon came next to the Sabbath (Num. xxviii. 9-15); and in the sacred number *seven*, which is supposed to be a relic of star-worship, and connected with the seven planets. The whole cycle of the earlier Festivals (q. v.) was regulated by the number seven, in days, weeks, months, and years; and according to the prophet Amos the planet Saturn was worshipped in the wilderness (Amos v. 26; *cf.* Acts vii. 43).

Although the polytheistic notions described above lingered in the minds of the people down to a late period of the national existence, a new era began under Moses. It has been pointed out that several of the details of the Mosaic worship were borrowed from the Egyptians, *e.g.*, the Ark (q. v.), the Urim and Thummim (q. v.), and the priestly vestments, but be this as it may, the national deity of the J. as conceived by Moses was raised far above the nature-gods of the Egyptians, whom he had vanquished in the Plagues, and in the deliverance of his people. With Moses he was the creator and the Lord of nature, which perhaps is the meaning of the new name Jehovah (q. v.) now given to him. But the greatest feature of the Mosaic reformation was the connection established between religion and the moral life. However unable to grasp the idea that there were no gods but Jehovah at all, it was an extraordinary advance for the people, to learn, as they did through Moses, that Jehovah differed from all the other gods in this respect that he desired to be worshipped not only with sacrifices and festivals, but by the observance of moral precepts. It was alongside of and through this differentiation of Jehovah from all other gods that the idea of Monotheism was gradually developed. This was the principle which was contended for so strongly by Samuel, the first of the prophets, in connection with the choice of a king; as it was by the succeeding prophets, who declared that Jehovah had no pleasure in their sacrifices and festivals, for the worship he desired was 'to do justly, and to love mercy, and to walk humbly with their God' (*cf.* Isa. i.; Micah vi. 6-8). The J. were finally weaned from polytheism during their Captivity in Babylonia. There they came in contact with the religion of the Persians, which was a dualism (see PARSEES); and the influence of this contact is thought to be traceable in the development of their ideas regarding the immortality of the soul, Angels (q. v.), Demons (q. v.), Satan (q. v.), &c. After the Captivity the worship in the temple became more severely spiritual than formerly. The institution of the Synagogue (q. v.) was also established, brought thither from Babylonia, where the exiles used to assemble periodically to listen to the exhortations of the prophets or the reading of the Scriptures.

Language and Literature.—The Semitic Languages (q. v.) have been divided into three divisions—the Northern or Aramaic, to which the Chaldee and Syrian belong, the Middle or Hebrew, and the Southern or Arabic. The almost unquestioned opinion used to be that the Hebrew was spoken by Abraham from the first, that in fact it was the one Holy Language that was spoken before the confusion of tongues. The principal argument for this opinion is drawn from 'the fact that the proper names of persons and places which occur in the oldest portions of Genesis clearly show a Hebrew derivation,' *e.g.*, Adam, Eve, Eden, Abel, Nod, Enoch, &c. But it has been pointed out that these are not pure names, but appellatives applied to the objects in allusion to their history, which implies that this was done at a later time; while for others of the names the Hebrew does not afford an etymology at all, *e.g.*, most of the names in Gen. iv. 17, 18 (as well as Tubal-Cain) and v. 12-25. As to Abraham and the tribe he led from Haran, there can be no doubt that till they arrived in Canaan the language they spoke was the Aramaic, which remained the language of Abraham's nephew Laban, as we see from Gen. xxxi. 47. The heap of stones erected by Jacob and Laban received from the former a Hebrew name (Galeed), and from the latter a Chaldee one (Jegar-sahadutha), *cf.* Deut. xxvi. 5. From this it would appear that Abraham's tribe must have adopted the Hebrew language, which was originally very closely akin to the Phoenician, after they settled in Canaan. This view is supposed to be confirmed by several circumstances—(1.) In all the intercourse which there was between the Hebrews and the Canaanites, there is no intimation of any diversity of language. (2.) The names of Canaanitish persons and places are Hebrew, *e.g.*, Kirjath-sepher (Heb. 'city of book'), Shechem (Heb. 'shoulder'), Abimelech (Heb. 'father of the king'), Melchizedek (Heb. 'king of righteousness'). (3.) Importance is attached by some to the fact that Isaiah (xix. 18) calls the Hebrew the language of Canaan. The earliest knowledge we have of Hebrew is derived from the Old Testament, which is composed in that language, with the exception of Ezra iv. 8-vii. 18; vii. 12-26; Jer. x. 11; Dan. ii. 4-vii. And the language of the earlier writings is in such an advanced stage of perfection that the difference between them and the later is very slight. Indeed the purest Hebrew is the oldest, and what change there is in the later is rather a degeneracy. The separation implied in Gen. xxxi. 47 between it and the Aramaic must have taken place before the composition of the earliest writings. It is a matter of controversy how long the Hebrew remained the spoken language of the people. The most prevalent opinion, both among J. and Christians, has been that it was so only down to the Captivity. The principal argument for this opinion is found in Neh. viii. 8, which is understood to mean that when the law was read to the people it had to be interpreted to them in Chaldee, the word *m'phorash* ('distinctly') being held as equivalent to 'interpreted.' It is contended, on the other hand, that the meaning of the word here, as in other passages, is just that given in the authorized version, 'distinctly, audibly,' and that it is not implied that the explanation given after the reading was in another language. Further, it is maintained that the Hebrew must have remained the vernacular of the J. in Palestine, even after the Captivity, because several of the canonical books which were intended to have an immediate influence on the people were written in it. Still, the Aramaic became the vernacular of the J. who remained in Babylonia, and in course of time of those in Palestine also; a change which was chiefly effected in the latter country during the Syrian dominion (B.C. 198-138). Aramaic was next adopted as the written language, as appears from the fragments in the books of Ezra and Daniel. The Hellenistic J., however, living in countries where Greek was spoken, adopted that language as their vernacular, and translated their Scriptures into it. (See SEPTUAGINT.) It is generally assumed, from the fact that the four Gospels were written in Greek, with the exception perhaps of Matthew (the original of which may have been written in Aramaic), that that language was the vernacular in Palestine in the time of Christ. (See Roberts's *Discussions on the Gospels.*) But if Greek had been well understood at Jerusalem in the time of Christ it must have been much more so in the time of Josephus, who belonged to the next generation; whereas he, a well-educated Jew, remarkable for his love of learning, tells us that he had only acquired it with great labour, after he was forty years of age, for the special purpose of writing his history, and that although he had acquired a grammatical knowledge of it, the habitual use of his native tongue prevented his accurate utterance of it (*Ant.* xx. 11, 2; *Con. Ap.* i. 9). In a number of other passages of his writings he expressly refers to the fact that his countrymen were completely ignorant of Greek. The study of the Scriptures, at anyrate, which was carried on in regular schools in Babylonia and Palestine, was not from the Septuagint but the original text. After the destruction of Jerusalem the chief school was at Tiberias, but after the death of Rabbi Jehuda II. (275) the great seat of Biblical learning was in Babylonia. The language used by Jewish writers of this period was the Aramaic, and partly the Hebrew. After the 10th c. they began to make some use of the Arabic, which, by the spread of Mohammedanism, had driven out the Aramaic. After this, however, scholarship among the J. was found farther to the west; first in Spain and the north of Africa, where, from intercourse with the Moors, Arabic was the language used, and later in France

and Germany, where the use of Hebrew was resumed. For further particulars regarding the literature, see APOCRYPHA, BIBLE, CABALA, MASORA, MIDRASH, TALMUD, TARGUM.—Authorities: Basnage, *Histoire des Juifs* (Rotterd. 1706); Ewald's *Gesch. d. Volkes Israel* (3d ed. 1864–69; Eng. transl. 1869); Milman's *History of the J.* (new ed. 1863); Stanley's *Jewish Church* (6th ed. 1875); Kuenen's *Religion of Israel* (1874); Picciotti's *Anglo-Jewish History* (Lond. 1876); and Ignaz Goldziher's *Mythology among the J.* (Eng. transl. Lond. 1877).

Law Regarding Jews.—Previous Acts which prescribed certain forms of declaration to be made by J. on taking office were repealed in 1868, and a uniform oath prescribed for all. (See AFFIRMATION OATH.) By 21 and 22 Vict. c. 49, Parliament was opened to the J., either House being empowered to admit them by a resolution dispensing with the phrase '*upon the true faith of a Christian*,' and in 1866 J. were empowered to sit in Parliament on taking an oath similar to that taken by members of other religious sects. But J. are still disqualified for the offices of Regent of the kingdom, Lord Chancellor, or Lord-Lieutenant of Ireland, or Her Majesty's High Commissioner to the General Assembly of the Church of Scotland. J. born in the United Kingdom are subjects of the Queen.

Jew's Harp, or **Trump**, a small metal instrument, capable of producing very beautiful sounds. It is held in the mouth, while a vibrating tongue is touched by the forefinger. The J. H. has long been known in many parts of the world. The name is a corruption either of Fr. *jeu* (a 'game'), or of the Eng. *jaw*.

Jew's Mallow. See CORCHORUS.

Jew's Thorn. See JUJUBE and PALIURUS.

Jeypore' (Jaipur), the capital of the native state of the same name, in Rajputana, India, 140 miles W. of Agra, and a station on the new Rajputana Railway. It was founded in the early part of the 18th c. by the great astronomer and statesman Jai Singh, who removed here the seat of government from Amber. It stands in a plain, surrounded by stony hills, and is regarded as the most handsome and regularly built town in India, with numerous gardens and palaces.

(1) The *state* of J., formerly known as Amber, from the original capital, lies W. of Gwalior, and has an area of about 15,250 sq. miles; pop. about 2,000,000; revenue, £475,000, and about twice as much more is absorbed by feudal and religious grants; tribute, £40,000; army, 72 guns, 4450 horse, and 15,858 foot. The soil is sandy and rocky, but great part is irrigated from wells, and cattle are numerous. There are mines of copper, alum, iron, and cobalt; 40,000 tons of salt are raised from the Sambhur Lake, half of which is within J., now leased to the British Government. In 1874–75 about £400,000 worth of European piece goods was ascertained to be imported into this state. The ruling dynasty, which dates from 967 A.D., has produced many distinguished men, and was in favour with the Delhi emperors. The ravages of the Mahrattas rendered necessary an appeal to British protection in 1817. The present (1877) Maharajah is an enlightened ruler, and spends large sums on public works. His loyalty during the Mutiny, and charitableness during the Rajputana famine of 1868, were conspicuous. Since 1869 he has been a member of the Legislative Council of India. J. was visited by the Prince of Wales in 1876. See *India and its Native Princes*, by Louis Rousselet (Lond. 1875).

Jeypore Agency. A collection of semi-independent hill states in the district of Vizagapatam, Madras Presidency, British India, lying between the E. Ghauts and the state of Bustar in the Central Provinces; area 13,041 sq. miles; pop. (1871) 766,128. The Rajah of J. has an income of £3000, and pays a tribute of £1600. This tract is inhabited by the aboriginal tribe of Khonds, and was notorious for the regular practice of human sacrifice, which is known to have continued as late as 1855. The victims, called *meriahs*, were bought as children in the plains, and carefully bred up for the purpose. Four sub-magistrates are now stationed in this tract.

Jeysulmere' (Jasalmir = the rocky oasis of Jasal), the capital of the native state of the same name, in Rajputana, India, 1290 miles N.W. of Calcutta, said to have been founded in 1156 A.D. It stands on a rocky ridge, and the houses are built of yellow sandstone, elaborately carved. The citadel contains the palace, which is surmounted by a metal umbrella on a stone shaft. The *state* of J., which lies in the Great Indian Desert, between Bikanir and Scinde, has an area of about 12,250 sq. miles; pop. about 75,000; net revenue, about £10,000. It is a waste of sand hills and rocky ridges, and no running streams. Millet forms the only food-crop, and camels are used for ploughing. There is considerable through trade.

Jhallawur', a native state in Rajputana, India, in connection with the Haraoti Agency; area, about 2500 sq. miles; pop. about 226,000; revenue estimated at £160,000; tribute, £8000. It was formed by the British only in 1838, out of the state of Kotah, to provide for a descendant of the minister of the latter state. The soil is rich, and produces opium; the hills are well-known hunting ground for tigers.

Jhan'si, the chief town of the district of the same name, N.W. Provinces, British India, 245 miles W. of Allahabad; pop. (1872) 536, besides European and native troops. This only refers to the new town; the old town, which was handed over to the native state of Gwalior in 1861, is estimated to contain 30,000 persons. In the latter is the fort, built by the Mahrattas, which entirely commands the British station; the houses are of brick and the streets regular. The new town is known as Jehanabad. In June 1857 the sepoys mutinied; and with the express approval of the disinherited Ranee of J., massacred all the Europeans to the number of 66. The fort was retaken by Sir Hugh Rose in April 1858. The *district* of J. has an area of 1567 sq. miles; pop. (1872) 317,826. The largest town is Mow.

Jheend (Jhind), the capital of the native state of the same name, Punjaub, India, on the Feroz Canal, 979 miles N.W. of Calcutta. It is a considerable place. The state of J. has an area of 985 square miles; pop. 190,475; revenue, £60,000; army, 2000 men. The ruling dynasty, which was founded by a Sikh in 1763, has always been loyal to the British, and received considerable accession of territory after the Mutiny. The Rajah with his troops served through the siege of Delhi. See Leppel Griffin's *Rajahs of the Punjaub* (Lahore, 1870).

Jhe'lum (Jhilam), the ancient Hydaspes, one of the five rivers of the Punjaub, India. It rises in the N.E. of Cashmere, flows W. through that state, and turns S. through a narrow pass into the plain of the Punjaub. It is navigable up to the town of J., and again in the valley of Cashmere. It finally joins the Chenaub after a total course of about 490 miles. It was on the bank of this river that Alexander defeated Porus, and founded the city of Bucephala; the spot is identified with Jelalpore.

Jhelum, the chief town of the district of the same name, Punjaub, British India, on the right bank of the J. river, 100 miles N.E. of Lahore; pop. (1868) 5158. It is a modern town, with one native regiment in the cantonments; the only business is boat-building. The river is here crossed by the new Northern State Railway, on a bridge of fifty spans which cost £147,000. The *district* of J., which lies E. of the river, has an area of 3909 sq. miles; pop. (1868) 500,988. It is celebrated for containing the Salt Range, of which the hills are about 3000 feet high, and the beds of salt from 150 to 200 feet thick. 'Nowhere else in the world are deposits of such extent and purity known to exist.' The chief mine is called after Lord Mayo; it yields a revenue to Government of £300,000 per annum. Coal and other minerals are also found. There are many monuments of antiquity in the district.

Jhung (Jhang), the chief town of the district of the same name, Punjaub, British India, 96 miles N.E. of Multan; pop. (1868) 9124. It is a considerable centre of local trade. The imports are valued at £80,000; the exports at £65,000. The *district* of J., which lies mostly in the arid tract between the rivers Jhelum, Chenaub, and Ravee, has an area of 5702 sq. miles; pop. (1868) 348,027. The most populous town is Mughianah.

Jib, a large sail of triangular form running from the bowsprit to the masthead in small vessels, and from the jib-boom (a spar running out from the extremity of the bowsprit) to the fore-top-masthead in large ones. The J. has effect in bringing the ship's head to leeward when the wind is a-beam.

Jidd'ah. See JEDDAH.

Jig (*gigue*, *giga*), a lively dance for one or more performers. J. tunes have been written in Britain from the 16th c. onwards. The rhythms are various, but 'triplets' are an almost constant element in them. The J. is found as a movement in a *Suite* (q. v.) from the end of the 17th c. to the time of Haydn,

and was gradually transformed into the 'last movement' of a sonata.

Jigg'er, a ship's tackle with a block at one end and a sheave at the other, used to 'hold on' to the cable, *i.e.*, keep it tight as it leaves the windlass.

Jihun'. See OXUS.

Jikad'ze, or **Shikat'ze,** the capital of the district of Zang, in Tibet, on the right bank of the Zangbo, 190 miles W. of H'Lassa. It contains a number of palaces, temples, and tombs, richly ornamented. The chief building is an immense palace or temple, the residence of one of the principal lamas, who has a suite of over 4000 persons. Pop. supposed to be about 100,000.

Jo'achim, Joseph, a celebrated violinist, born near Presburg, in Hungary, of Jewish parents, July 15, 1831. His teachers were Böhm, David, Moritz, and Hauptmann. From the Vienna Conservatoire he went to Leipzig, and was at the Gewandhaus for seven years. In 1850 he was made Director of Concerts at Weimar, in 1853 Master of the Hanover Chapel Royal, and in 1869 a Director in the Berlin Conservatoire. He appears annually in England, and was made Doctor of Music by the University of Cambridge in March 1877. J. is perhaps the most brilliant and powerful violinist of this century.

Jo'achimstahl (Joachimov), a Bohemian town 35 miles S. of Chemnitz, situated in the Erzgebirge, 2400 feet above the sea, and on the Weseritz, a branch of the Eger. Pop. 5641. J. was once twice as large, owing to its mines of silver, which, discovered in 1516, yielded, at the close of the 16th c., 20,000 marks, but now produce only 8500. There are also mines of iron, lead, and tin, and paper and coarse lace are manufactured. Large silver coins, first struck here in 1519, were called *Joachimsthaler*, from which shortened has arisen the German *thaler* and American *dollar*.

Joan of Arc. See JEANNE DARC.

Joan, Pope, was believed during the 13th c. to have been an Englishwoman of great learning, lewdness, and ability, who rose to the highest rank in the Catholic Church on the death of Leo IV., whom she succeeded (855), the supposition being that she was a man. It was also believed concerning her that between the Colosseum and the Church of St. Clement, Rome, she was seized with the pangs of childbirth, and died after holding the papal office for two years and five months. The prevalence of this belief gave rise to one of the most noteworthy controversies in history, the result of which is that both Catholic and Protestant writers have agreed in rejecting the tale as a groundless fiction. The authorities on which the story is based are Marianus Scotus, Martinus Polonus, and Stephen de Bourbon, the most recent believer in its authenticity being Professor Kist of Leyden. Panvinius, Blondel, Leibnitz, and Wensing are the most weighty authorities against its credibility.

Job, Book of, is one of the finest of the Old Testament Scriptures. The traditional view regarding it has been that Job was a real person, and the book a record of facts. The tendency among modern scholars is to regard it as a dramatic poem, as it is called even in the Talmud, with a historical prologue and epilogue, intended to teach certain ideas. But even by those who regard it in this light, the writer's aim is differently understood. Some have conceived it to be simply to set forth Job as an example of patience under suffering, or to set forth the conflict and victory of the pious in the heaviest troubles; but if this be the nature of the book, its aim undoubtedly is to throw light on the Divine procedure in the connection between evil and the moral conduct of men. The idea prevalent among the Israelites was that the lot of men in this world, both generally and in detail, was determined entirely by their moral character and conduct, so that every outward calamity was a punishment for some known or unknown sin, as prosperity was the reward of piety. This idea is expressed in the book in the speeches of Job's friends; and is shown to be a false one by the whole scope of the book, not merely by Job's replies to his friends, but by the prologue, according to which unparalleled calamities befell a pre-eminently pious man, and by the epilogue, in which God is made to admonish the friends, and impose an atoning sacrifice upon them because they had not spoken rightly of him as Job had done. The author and date of the book can only be conjectured. The Talmud ascribes it to Moses, and some assign to it even an earlier date. But from xiii. 26 and xxxi. 35 it appears that at the time of the composition it was customary to make a charge against any one before a tribunal in writing; and this alone would fix it down at least to the time of Moses, before which there is no trace of the art of writing (see Ewald, *History of Israel*). It is supposed also, from xii. 17–19, that the author had witnessed some such circumstances as he describes. On the other hand, since Ezekiel, Jeremiah, and the author of Proverbs i.–ix. seem to have been acquainted with it (*cf.* Jer. xx. 14–18 with Job iii., and Ezekiel xiv. 14–20), it must have been composed before the Babylonian exile. It was therefore most probably written between the Assyrian and Babylonian exiles. There is some reason to suppose that the discourses of Elihu (xxxii.–xxxvii.) are a later interpolation. See Bleek's *Einl. in das A. T.* (Eng. trans. 1869).

Job's Tears (*Coix lachryma*), a native grass of the E. Indies and Japan. The large round shining seeds have, when unripe, some resemblance to heavy tear-drops—hence the name. It is said to have strengthening and diuretic qualities.

Joc'elin of Brakelond, a Norman Englishman, native of St. Edmundsbury, who lived in the reign of King John, was monk and chaplain of the monastery of his native place. He wrote *Chronica Jocelini de Brakelonda* when in that position, recording the deeds of Abbot Samson, his superior, in a 'kind of monk or dog-Latin.' Carlyle in *Past and Present* gives a vivid, if occasionally strained, account of his book and contents, comparing him to Boswell, and describing him as a man 'of patient, peaceable, loving, clear-smiling nature.' 'Then also he has a pleasant wit.' See *Chronica*, edited by J. G. Rokewood (Camden Society, London, 1840).

Jodhpore', the capital of the native state of the same name in Rajputana, India, 358 miles S.W. of Delhi, and 1128 miles W. of Calcutta. It was founded by the Rajah Jodha in 1459, who removed hither the seat of government from Mandor, 5 miles N., where there are still fine tanks and marble ruins. J. is built on a rocky ridge, 300 feet above the plain, and contains many large tanks, wells, and freestone edifices, with a strong citadel, and a wall five miles in circumference.

The *state* of J., which is also known as Marwar, lies between Jeypore and Scinde, and is the largest of the Rajputana states. Area, about 35,672 sq. miles; pop. 1,783,600; revenue, £250,000; but twice as much is absorbed in feudal and religious grants; tribute, £21,300. The greater part consists of sandy or gravelly plains and grass jungle, on which are bred horses, camels, and cattle. Salt is manufactured in immense quantities at the Sambhur Lake, half of which adjoins the State, and is leased to the British; the other minerals are tin, lead, iron, alum, limestone, sandstone, and marble. The climate is healthy, but J. is liable to severe droughts. The other towns, besides J., are Nagore in the N.E., and Pali in the S. The only river is the Luni, or Salt River, which ultimately loses itself in the Runn of Kutch. The ravages of the Pindarees rendered necessary an appeal to British protection in 1818. Six years afterwards Marwar was made over to the British, and is still administered by us. The present (1877) chief, Jeswunt Singh, is a vigorous administrator. See *India and its Native Princes*, by L. Rousselet (Lond. 1875).

Jo'el (Heb. 'Jehovah is God') was one of the prophets of Judah, the date of whose prophesying has been fixed by different scholars at very various times, varying from the 10th c. to the 6th c. B.C. The most probable opinion is that he was a contemporary of Amos in the reign of Uzziah (B.C. 810–758; *cf.* i. 4, i. 25 with Amos iv. 6–9, and iii. 4–8 with Amos i. 6–10). It is also debated among critics (1) whether the description of locusts and their devastation is to be understood literally, or figuratively of hostile armies and their ravages, as *e.g.* those of Tiglath-Pileser, Shalmaneser, Sennacherib, Nebuchadnezzar, &c.; and (2) whether it is a description of a present plague or a prophecy of a future one.

Joe Miller, a term applied to stale threadbare jokes, from the name of a comic actor who died in 1738. He was a noted coiner or retailer of good things, a collection of which was published anonymously by John Mottley in 1739, with the title of *J. M.'s Jests, or the Wit's Vade Mecum.* In ten years the work, which is greatly marred by coarseness, passed through fifteen editions. *The Family J. M., a Drawing-Room Jest Book* (1848)

is a more palatable publication. A facsimile of the original edition of 1739 was issued by Chatto & Windus in 1870.

Jogg'le, a term in masonry variously applied to any sort of jointing in which one stone is let or fitted into another with a notch or curve, so as to keep them both from slipping.

Johann' von Schwaben, also called **Johann the Parricide**, born about 1288, was the son of Rudolf, Duke of Swabia, and grandson of Rudolf, Duke of Habsburg. His uncle, the Emperor Albrecht I. (q. v.), having refused to make over to him, on his coming of age, the Duchy of Kyburg, which he had inherited from his mother Agnes, a Bohemian princess, J. conspired with some other Upper Swabian knights and killed him near Windisch, while he was crossing the river Reuss on an expedition to punish the mountaineers of the three rebel cantons of Switzerland. The conspirators fled, and all, save one Von Wart, died in wretchedness and obscurity, J., it is said by some, as a monk at Pisa in 1360.

Johann'a, the most prosperous and picturesque of the Comoro Isles (q. v.), between Madagascar and the E. coast of Africa.

John was the name borne by twenty-three of the Popes.—**John I.**, afterwards canonised, was Pope from 523 to 526. Sent on a successful mission to the emperor at Constantinople by the Arian king Theodoric, he was nevertheless thrown into prison at Ravenna on his return, and died there.—**John VIII.**, a Roman, Pope from 872 to 882, unpopular in Italy on account of his partiality for the Western Franks, crowned Karl the Bald Emperor, in spite of the protest by Ludwig the German, and at the next vacancy he supported the claims of Karl the Fat to the imperial crown. In the hope of securing jurisdiction in Bulgaria, he intrigued with the Greek emperor Basil, and recognised the banished Photius as Patriarch of Constantinople. Foiled in his expectations, he subsequently condemned Photius.—**John XII.** (956-964) was the first Pope who changed his name on assuming the papal dignity, and was formerly named Octavianus. He was but eighteen years of age when he became Pope, and he speedily covered himself with infamy by his licentiousness. He invited the German king Otho I. to assist him against Berengar II., crowned him Emperor, but proving disloyal, was deposed by Otho.—**John XXII.** (1316-34), born at Cahors in 1244, was a learned and distinguished canonist ere he took service as chancellor of the King of Naples. He became in succession bishop of Fréjus, archbishop of Avignon, and cardinal and bishop of Porto, and being in 1316 elected Pope at Lyon, he continued to maintain his residence in Avignon. He took lofty ground with the Emperor; and when the contest arose between Ludwig of Bavaria and Friedrich of Austria, he did his best to make the papacy supreme over the Empire. When fortune declared for Ludwig, he cited him before him, and when he refused to appear, excommunicated him. In Italy the Pope had the Guelph party to support him. He freely excommunicated the Ghibelline leaders, as well as the numerous scholars and divines, who denied the Pope's right to decide in civil cases. Meanwhile Ludwig entered Italy; had himself crowned emperor by bishops; and citing J. to appear before him to answer charges of heresy and high treason, he proceeded to depose him, and made Nicholas V. Pope. But when Ludwig left Italy, the Ghibelline cause decayed, and J., though he never visited Rome, soon secured his power again. He did much to defend Christendom from Mohammedan aggression; and when he died at Avignon left a treasury well filled by means of unexampled extortion.—**John XXIII.** (1410-1415), a Neapolitan, was made Pope in spite of his moral character, but was a man of great ability. When a council had become absolutely inevitable, by reason of the controversy with John Huss, J. summoned it to Constance. The same council finally found him guilty of seventy shameful deeds, and deposed him. J. spent some years in prison, but was pardoned by Pope Martin V., and died at Florence in 1419. For most of the above see Artaud de Montor's *Histoire des Souveraines Pontifes* (8 vols. Par. 1847-49).

John, youngest son of Henry II. and Eleanor of Guienne, was born at Oxford 24th December 1166. In 1185 Ireland was placed under his control, and, after having intrigued against his father (1189) and his brother Richard (until 1199), he was elected King of England. Arthur of Brittany, his nephew, was supported in France by King Philippe, but at Mirabel he came into J.'s power, and was despatched in prison. In 1200 J. divorced Hawisia of Gloucester and married Isabelle of Angoulême, and during the next few years lost Normandy, Anjou, and Guienne. 'The separation,' says Professor Stubbs, 'did much for England. Henceforth the king is mainly if not solely king of England, and the welfare of England the main if not the sole object of English counsels.' A dispute about the right of electing the Archbishop of Canterbury (1205) drew forth an interdict from Pope Innocent III., which (1212) was increased to a declaration that J.'s vassals were absolved from their allegiance. On May 15, 1213, J. made an abject submission, accepting Stephen Langton as Archbishop of Canterbury. Immediately a baronial quarrel arose owing to the increase of taxation, the hosts of mercenaries, and the plundering of the Church, which culminated (June 15, 1215) at Runnymede, near Windsor, where J. was compelled to sign the Magna Charta (q. v.). 'Although it is not the foundation of English liberty, it is the first, the clearest, the most united, and historically the most important of all the great enunciations of it, and it was a revelation of the possibility of freedom to the medieval world.' Though Archbishop Langton had sided with the barons, the Pope annulled the charter, and a war arose between the king and his subjects, who at last offered the crown to Louis, son of Philippe of France. On the 18th October 1216 J. died at Newark, in the midst of the war. 'Of all the kings he was,' writes Professor Stubbs, 'the most vicious, the most profane, the most tyrannical, the most false, the most short-sighted, the most unscrupulous;' and yet it is certain that he had the hereditary cleverness and vivacity of his race, with all the inborn resources of the warrior. See Pearson's *History of England* (vol. ii.), Stubbs' *Early Plantagenets*, and *Documents Illustrated, &c.*, Green's *Short History of the English People*.

John, Don, of Austria. See JUAN, DON, OF AUSTRIA.

John, Eve of St. According to Luke i. 26, 36, John the Baptist was older than Christ by six months, so that the birthday of the latter having been fixed at the Winter solstice, that of the former falls at the Summer solstice—the 24th of June. Owing to this circumstance several heathen practices passed into the observance of the Christian festival. The most prominent of these is the custom which used to prevail all over Europe, as well as in the E., and in some places has not yet altogether died out, of kindling great fires on midsummer eve, which was simply a relic of sun-worship, of the same nature as the rites observed at the Winter solstice (see YULE) and on May-day (see BELTEIN). These heathen practices, at first opposed, gradually came to be tolerated, and were finally adopted by the Church as her own. The fires of midsummer eve got the name of St. John's fire, being explained by the Church as an allusion to the words of Christ (John v. 35) regarding John: 'He was a burning and a shining light.' A curious mystical connection was also early observed between the Baptist's words regarding Christ (John iii. 30): 'He must increase, but I must decrease,' and the fact that after Christmas the days lengthen, and after midsummer shorten.

John, Knights of St., the oldest of the religious orders of knights in the middle ages, originated (1048) in a society of merchants at Amalfi for the defence of pilgrims to Jerusalem. These merchants founded at the sepulchre of Jesus in Jerusalem a church and cloister, whose inmates lived after the rules of the Benedictines; and soon afterwards a hospital for poor and sick pilgrims was added, dedicated to St. John the Baptist, wherefore the monks were named the Hospital-brothers of St. John of Jerusalem. Released at the conquest of Jerusalem in 1099 from severe persecution by the Seljuk Turks, the order increased in importance, and under its first superior, Gérard Tonque, received a constitution from Pope Pascal II. Gérard's successor, Raimond of Puy, changed the institution to a religious order of knights in 1118, adding to the monastic vows a solemn engagement to join in battle against the infidel, and himself taking the title of master of the order, which was now to consist of three classes—knights, of noble birth, to bear arms; priests or chaplains, to officiate in religious worship; and serving brothers, to tend the sick and relieve pilgrims. Under the favour of the Popes it rapidly increased, but gradually deviated more and more from its original objects. Monasteries called *commanderies* were planted in lands far from Palestine, the proper theatre for the K. of St. J., in

order to raise money for their holy wars. After the taking of Jerusalem by Saladin in 1187, they removed to Ptolemais, and afterwards (in 1291) to Limisso in Cyprus. In 1309 they conquered Rhodes, and called themselves *Knights of Rhodes*; but after a hard struggle with the Turks had to surrender the island to Soliman II. in 1522. They then wandered about for a time without forming a permanent settlement, till Karl V., in 1530, gave them Malta, Gozo, and Comino, as a fief, after which they were called *Knights of Malta*. The Reformation cost them their possessions in England, the Netherlands, and Scandinavia. The Revolution in France had the same result, and when Napoleon I. took Malta in 1798, they were driven thence. The last grand-master, Hompesch, laid down his authority at Trieste, and in his stead was chosen the Emperor Paul of Russia, but the election was set aside on the protestation of the Pope, and to avoid a conflict with Russia the Elector of Bavaria abolished the order in his dominions. In 1810–11 the order was abolished in Prussia, and all its property confiscated; while the name was retained in *Der Preussische Johanniterorden*, which, founded in 1812 as a decoration reserved for nobility, was in 1852 developed to an evangelical order of knights, for the care of the sick, under King Friedrich Wilhelm IV.'s brother, Prince Karl, with branches in several Prussian and other German provinces. This order was very active in the wars of 1864, 1866, and 1870–71. After the fall of Napoleon I. the K. of St. J. sought in vain to be restored to Malta, but the Pope permitted the removal of the chapter to Ferrara (in 1826), and afterwards to Rome (1834). The arms of the order consisted of an octagonal silver cross on a red ground, with a crown surrounded with a garland of roses. In peace the knights wore a long white mantle with a white octagonal cross on the breast; in war they had a red coat with a cross of the common shape on the breast and back. The K. of St. J. still preserve at Rome, Venice, Naples, and Prag, the shadow of the *Grand Priories* that once were widely established among European nations, and one of which (at Clerkenwell) gave its holder the title of First Baron of England.

John, Prester. See PRESTER JOHN.

John, St., the Apostle, was the son of Zebedee, a fisherman of Galilee, and followed that occupation himself till his call to be a disciple of Christ (Matt. iv. 21, 22; Mark i. 19, 20), from whom he received special marks of affection, above even Peter and his own elder brother James. The traditional history of the latter part of John's life is that he remained at Jerusalem till about 48, when he went to Asia Minor, and there founded several churches, residing chiefly at Ephesus; that under Nero (54–68), or Domitian (81–96), he was banished to Patmos, where he received the vision of the Apocalypse; that on his liberation he returned to Ephesus, where he wrote his Gospel and Epistles about (90–100), and remained till his death, about 100, in the hundredth year of his age. The writings ascribed to him are the Fourth Gospel, the three Epistles which bear his name, and the Apocalypse (q. v.). It is round the Fourth Gospel that the hottest war of controversy has raged in connection with the Life of Christ, because it is contended by those who question its authenticity and fix its date, some of them, so late as 150, that it gives a more fully developed and altogether different conception of Christ from that of the Synoptists. (See GOSPELS.) The authenticity of the First Epistle must stand or fall with that of the Gospel, for almost all agree that it is by the same author. The tradition that the second and third Epistles were written by St. J. is ancient, but they were classed by Eusebius among those writings which in his time were not received by all the ecclesiastical authorities. They may have been written by John *the elder* (*cf.* II. 1, III. 1), who lived at Ephesus, and was sometimes confounded with St. J.

John, St., the fourth largest city in the Dominion of Canada, and the emporium of New Brunswick, lies at the mouth on the left bank of the river of the same name. Its harbour is free from ice owing to the tide-falls of the Bay of Fundy, and this gives it an advantage over all the Dominion ports. The town is now connected by railway with all parts of the Dominion, and has a fine cathedral of the Immaculate Conception, handsome state buildings, a penitentiary, lunatic asylum, hospital, skating-rink, three daily, one tri-weekly, and eight weekly newspapers, &c. It exports large quantities of pine timber to America, of deals to England, and of shooks to the W. Indies, and carries on an active shipbuilding trade. The river is spanned by a fine suspension bridge 640 feet long. Pop., including the suburb of Portland, 45,000.

The *river* St. J. rises in Maine, U.S., forms the international boundary for about 60 miles, flows mainly in a S.E. direction through New Brunswick, and enters the Bay of Fundy after a course of 450 miles. It is navigable for vessels of 150 tons to Fredericton, a distance of 80 miles.

John of Leyden. See JAN OF LEYDEN.

John o' Groat's House, on a rocky promontory 1¼ miles W. of Duncansbay Head in Caithness, was long and widely known as marking the limit of Scotland on the N.; *e.g.*, 'frae Maidenkirk to Johnny Groat's' (Burns). The legend of John o' Groat or Groot is told by Robert Chambers in his *Picture of Scotland*. The descendants of a Hollander of the above name who had settled in this remote spot in the reign of James IV., having quarrelled about precedence, one of the eight members of the family restored peace by erecting an octagonal building entered by a door on every side, and containing a table of the same shape. Whatever may be the value of the legend, there is documentary evidence to prove the existence of a family of this name near Duncansby Head as far back as the close of the 15th c., and various representatives of the family are said to exist in the present day (1877), among others, a Mrs. Cruickshanks in Pulteneytown, Wick. The site of J. o' G.'s H. is still outlined on the turf. Most probably the legend was suggested by the odd shape of what was formerly a ferry-house for the Orkneys. See *Statistical Account of Scotland*.

John (III.) Sobieski, King of Poland, son of the Castellan of Cracow (a great warrior and statesman), was born at Olesko, in Galicia, June 2, 1624, and, along with his brother Mark, received an excellent education. Both brothers were abroad at their father's death, when they entered the Polish army, which had just been defeated by the Russians at Pilawiecz. Mark fell in an action at the river Bug, but his brother distinguished himself so that he became the terror of the Turks and Tartars. In 1665 he became a marshal, in 1667 commander-in-chief and woiwode of Cracow, and (11th November 1673) inflicted a great defeat on the Turkish army at Choczim. He was chosen King of Poland 21st May 1674, and with his wife, the daughter of a French marquis, was crowned at Cracow in 1676. The war against the Turks was continued with the utmost vigour; and on the 12th September 1683 J. S. performed his greatest exploit, the relief of Vienna when besieged by the Grand Vizier with 200,000 men, and defeat of the Turks outside the walls of the town. But neither from the delivered Austrians nor from his own subjects did the hero receive support to fitly follow up this success, which therefore had not the fruits that might have been expected. He died of apoplexy 17th June 1696.

John's, St., the capital, commercial emporium, and seat of government of Newfoundland, British N. America, lies picturesquely about 3 miles from Cape Spear, the most easterly point of land on the American side of the Atlantic. It has a fine harbour entered by the 'narrows,' and enclosed by hills rising abruptly to a height of 600 feet on each side. Its chief buildings are the Anglican cathedral designed by Sir G. G. Scott, and the Roman Catholic cathedral erected at a cost of $800,000. The industries are biscuit-baking, founding, oil-refining, tanning, distilling, &c. The town is connected with continental America by telegraph, and by regular steam lines with Halifax, Montreal, and New York. Pop. in 1802, 3420; in 1869, 22,553. Sir Humphrey Gilbert landed here when taking possession of the island in 1583.—**J., St.**, a beautiful town in the province of Quebec, Dominion of Canada, on the W. bank of the river Richelieu, at the head of Chambly Canal and of the navigable waters of Lake Champlain, and on the Grand Trunk Railway. It has saw, planing, and grist mills, several foundries and brick-fields, and a considerable trade in grain, timber, firewood, &c. Pop. 4000. St. J.'s is connected by a bridge with Iberville, or St. Athanase, on the opposite side of the river.

John's, St., the capital of Antigua, and residence of the governor of the Leeward Islands, is situated in the N.E. of the island, at the head of a wide but shallow bay. It has a cathedral, a courthouse, a large market, &c., and exports considerable

sugar, rum, and molasses. The temperature ranges from 96° to 68° F., and the average rainfall is 45 inches. Rain-water is gathered in cisterns. Pop. 8515.

John's, St., College, Cambridge, was founded in 1511, under the will of Lady Margaret, Countess of Richmond and Derby, and mother of Henry VII. Owing to the death of the foundress (1509) before the full completion of her designs, great difficulty was experienced in establishing the college on as large a scale as was originally intended; and it was mainly through the exertions of Fisher (q. v.), Bishop of Rochester, that sufficient funds were obtained to endow thirty-two fellowships. The college at present consists of a master, fifty-six fellows, sixty foundation and eight minor scholars, and forty-nine sizars. The fellowships and scholarships are open to all British subjects without restriction, except that the fellows must be in priest's orders within seven years of their M.A. The college sets £6700 apart from its annual revenues for the maintenance of scholarships, exhibitions, &c., and £180 for prizes. It has fifty-one livings in its presentation. St. J., which ranks second only to Trinity, is the great mathematical and North Country college. The buildings consist of four courts, the first of which is entered by a fine gateway, and contains the magnificent chapel, erected in 1867, from designs by Sir G. G. Scott, and moulded on the Sainte Chapelle of Paris. Its tower is the most conspicuous object in Cambridge. In 1875 the number of undergraduates was 381.

John'son, Andrew, seventeenth President of the United States, was born at Raleigh, N. Carolina, December 29, 1808. He never was at school, and was almost entirely self-taught. Apprenticed to a tailor, he went in 1826 to Tennessee, and settled in Greenville, becoming mayor in 1830. He was elected to the State legislature in 1835, and again in 1839. Next year he canvassed Tennessee in the Democratic interest for Van Buren. He sat in Congress from 1843 to 1853, when he became Governor of Tennessee, and he was elected to the United States Senate in 1857. He there supported the slave-holding and Democratic party generally, but when secession was mooted vigorously opposed it, and took the side of the North. As military governor at Nashville in 1862 he showed courage and ability in maintaining order. He was elected Vice-President in 1864, and on the assassination of Lincoln was sworn President, April 15, 1865. Though he had spoken violently against the South, he acted moderately, and granted general amnesties, to the chagrin of his Republican supporters. His Congress was hostile, and the contempt he showed for it in vetoing its decisions, and in dismissing Mr. Stanton, his war secretary, led to his impeachment in February 1868. J. was, however, acquitted. His term expired in March 1869. He was elected to the Senate in 1875, but died 31st July of the same year. See *Lives* by Savage (1865), Moore (1865), Foster (1866), and *Trial of A. J.* (3 vols. 1868).

Johnson, Reverdy, an American lawyer and statesman, was born at Annapolis, Maryland, May 21, 1796. He was admitted to the bar in 1815, elected a Maryland senator in 1821, was a United States senator 1845–49 and 1863–68, and Attorney-General of the United States 1849–53. In June 1868 he was sent as ambassador to London, where he negotiated a treaty on the Alabama Claims. This was, however, rejected by the Senate, and he was recalled in 1869, and has since resided at Baltimore.

John'son, Samuel, was born 18th September 1709, at Lichfield, in Staffordshire, England, where his father was a bookseller. After five years' schooling in his native city, one at Stourbridge, and two years' loitering at home, he entered Pembroke College, Oxford, in 1728, and whilst there produced a Latin version of the *Messiah* (1731), which won the applause of the whole university, as also of its author, Pope. Forced by poverty to leave college without a degree, he was for a time usher in the school of Market Bosworth, next lived at Birmingham, where he translated Lobo's *Voyage to Abyssinia* (1735), and having in 1736 married a Mrs. Porter, a widow of forty-eight, who brought him £800, started a boarding-school on his own account near Lichfield. The venture failed, and in 1737 J. came to London, with David Garrick, one of his three pupils, and an unfinished tragedy, *Irene* (acted in 1749). Private patronage was dead, the patronage of the public was only arising, and during the twenty-five years that J. led the life of a Grub Street hack, he was always in straitened circumstances, like his friend Savage (q. v.), whose life he published (1744). For *London*, an imitation of Juvenal's third satire, he got but £10, though it ran through an edition in a week, whilst his connection with Cave's *Gentleman's Magazine*, in which he wrote the parliamentary debates, besides prefaces, lives, and miscellaneous papers, was equally unremunerative. But he had made himself a name, and in 1747 Dodsley with four other firms engaged him for £1575 to compile his *Dictionary* (completed in 1755). Other works that greatly added to his reputation were the *Rambler* (1750–52, the last number appearing three days before his wife's death), *Idler* (1758–60), and *Rasselas* (1759), which last was written in the evenings of one week, and brought its author £125. In 1762 he received a pension of £300, and thenceforth wrote comparatively little, the *Lives of the Poets* (1779–81) being his only considerable work. In 1763 he met Boswell (q. v.), and in 1765 made the acquaintance of the Thrales, of whose family he came to be almost regarded as a member. The founding of the Literary Club (see CLUB), the receipt of an LL.D. diploma from Trinity College, Dublin (1765), visits to the Hebrides (1773), Wales (1774), and France (1775)—these are the most marked events of J.'s closing years. He died 13th December 1784 in Bolt Court, and was buried in Westminster Abbey. J.'s writings during his lifetime were popular beyond belief, his *Rambler* being ranked above the *Spectator*, his criticisms regarded as infallible. To us they seem commonplace, disfigured by mannerism, cramped, and warped by prejudice. A High Churchman, he was lenient to Catholics, but would credit no good of a Dissenter; a Tory, to him a Whig was 'vile,' whilst as a critic he preferred Pope's *Iliad* to Homer's, sneered at Bishop Percy's ballads, and could see no merit in *Gulliver*, *Tom Jones*, or *Tristram Shandy*. His style is a caricature of Sir Thomas Browne's. The dignity of the older writer becomes in J. pomposity; his quaintness, affectation; and a natural if overstrained niceness of diction, leads him to a studied avoidance of all that is native and home-grown in the English speech. Yet his name has become immortal through Boswell's *Life*. There we see the man as he lived, and looked, and thought. We mark the 'Sage's' uncouth person and tender heart, his weaknesses and kindnesses, his contradictions and solid learning, and above all we have such a vivid picture of the life and thought of his century as meets us in no autobiography or set history of the times. It may be added that a certain deep, rugged, honesty of soul exalts him above all his contemporaries, and gives to his character, though not to his writings, a permanent interest and vitality. The best editions of J.'s works are those by Hawkins (15 vols. Lond. 1787–89) and Murphy (12 vols. Lond. 1792; new ed. 1824). See Boswell's *Life*, and the Essays of Macaulay and Carlyle.

Johnson, Thomas, an English botanist, was born at Selby in Yorkshire, brought up as an apothecary in London, the University of Oxford conferring on him the degree of doctor of physic, and died in September 1644 from a wound received whilst fighting in the royal cause at Basing. He was the first who published an account of a botanical exploration in England (*Iter Cantianum*, 1629), the first who gave a catalogue of a defined botanising ground (*Ericetum Hampstediense*, 1632), the first who separated British plants from foreign ones (*Mercurius Botanicus*, 1634), and from his greatly improved edition of Gerard's *Herbal*, describing 2850 plants (1633).

John'ston, Alexander Keith, LL.D., F.R.S., a celebrated cartographer, was born at Kirkhill, in Edinburghshire, Scotland, 28th December 1804, served his apprenticeship as an engraver, travelled extensively, and studied the principal modern languages. Among the best of his many works are a *National Atlas* (folio, 1843), a *Physical Atlas of Natural Phenomena* (1847–49, 2d ed. 1854–56), for which he received the assistance of Brewster, Murchison, and others, and a *Royal Atlas of Geography* (1861). He may be regarded as the first of the great modern cartographers, and his maps surprised the world into delighted admiration by their fullness, accuracy, and beautiful engraving. Honours were showered upon him, and the Geographical Society of Paris proclaimed his *Physical Atlas* to be 'one of the most magnificent monuments that had yet been raised to the scientific genius of the age.' J. died at Ben Rhydding, 9th July 1871. His son, bearing the same name, is honourably known as a S. American traveller and a geographical writer.

Johnston, James Finlay Weir, a Scotch chemist, was born at Paisley in 1796. He studied at Glasgow University, and in 1825 opened a school in Durham. By his marriage in 1830 he came into possession of a considerable fortune, which he resolved to devote to the gratification of his taste for chemistry. He accordingly visited Sweden to study under Berzelius. On the foundation of Durham University in 1833 he was offered the readership in chemistry and mineralogy, a position which he accepted and held till his death, September 18, 1855. His various writings obtained a wide reputation and relate chiefly to agricultural chemistry; but perhaps his most attractive is his latest, entitled *The Chemistry of Common Life* (2 vols. 1854-55).

Johnston, Joseph Eccleston, an able Confederate general, was born in Virginia, February 1807. In 1829 he entered the U.S. army. He served as captain of engineers in the Mexican war and became a colonel. In 1860 he was made quartermaster-general, resigning April 22, 1861, to enter the Confederate service. He led the Southern soldiery at Bull's Run, and in the spring of 1862 held the command at Richmond. Wounded at Fair Oaks, May 31, 1862, on his recovery he was made general of the army in Tennessee. Here and in Georgia he sustained a series of reverses, and finally was superseded by Hood, July 17, 1864. Later he was called to lead the scattered forces in Georgia, S. Carolina, and Florida, but was unable to stem Sherman's victorious march. On hearing of Lee's surrender of the main army he capitulated to Sherman, April 26, 1865. Since the war he has resided in Georgia actively labouring for the resuscitation of the shattered South. See his *Narrative of Military Operations* (New York, 1874).

John'stone, a town of Scotland, in the county of Renfrew, on the Black Cart river, 2 miles W. of Paisley by rail. It has sprung into existence since 1781, and is now a thriving industrial centre, with large cotton factories, flax-mills, machine-shops, brass and iron foundries, &c. In the vicinity are extensive collieries. The 'Brig of J.' here spans the river. Pop. (1871) 6882. Cattle and horse fairs are held at J. in January and July.

Johnstown, a town in Pennsylvania, U.S., between the Conemaugh River in the N. and Stoney Creek on the S., 79 miles E. of Pittsburg by rail. It is on the Pennsylvania Canal, and has a rolling-mill and Bessemer steel work (in 1875 employing 6000 men), a woollen-mill, tannery, cement works, &c. The surrounding hills are rich in iron, bituminous coal, limestone, cement, and fireclay. Pop. (1871) 6028, but greatly increased since the census.

John the Baptist (Heb. 'God-granted'), a native of Judæa, and the son of Zacharias, a priest (Luke i., *cf.* Jos.), was beheaded by Herod Antipas. Closely allied to the Essenes in disregard of bodily comforts and dislike to the busy haunts of men, J. in spirit more closely resembled the old prophets. From the time of Zerubbabel there was a change in the form of the Jewish Messianic hopes. The Messiah (q. v.) is now, at least with the prophets, the Angel or Messenger of the Covenant (Mal. iii. 1), and in preparation for the glorious day of the Sun of Righteousness Elijah the prophet is to reappear to *convert* both old and young (Mal. iv. 2, 5, 6); or this harbinger is to be like the herald who proclaimed the return of the exiles from Babylonia (Isa. xl. 1-5). This mission J. fulfilled by preaching in connection with the simple rite of baptism, which was substituted for the dead service of sacrifice, a higher righteousness of heart and life, 'that the regeneration of the human spirit was to be accomplished, not by ceremonies or opinions, but by moral uprightness.' See Stanley's *Jewish Church* (2d ed. Lond. 1875).

John the Baptist, St., College of, Oxford, was founded in 1555 by Sir Thomas White, Knt., alderman of London, on the site of a Cistercian monastery. The original foundation consisted of a president, fifty fellows and scholars, a chaplain, an organist, six clerks, eight choristers, and two sextons. At present there are eighteen open life fellowships; four Fereday fellowships tenable for fourteen years, founded in 1854; five open and twenty-eight close scholarships, twenty-one of which are tenable for seven years by persons elected from Merchant Taylors' School; and four Casperol scholarships, tenable for four years. The college presents to thirty-one livings. In 1876 the number of members of Congregation was 17, and of commoners 89.

Johore', a Mohammedan state on the most southern point of the Malayan peninsula, 15 miles S. of Singapore, founded in 1511 by the inhabitants of Malacca, who had been driven out by the Portuguese. Area 20,000 sq. miles; pop. 40,000 Malays, and 60,000 Chinese. Exports, gambier, pepper, and tea. British relations with the Sultan of J. date from 1818; six years later he ceded the island of Singapore. The present ruler is a most enlightened prince, and has greatly developed the resources of the country. In 1866 he visited England, and was created a Maharajah. He has also received the orders of the Star of India, and of St. Michael and St. George.

Joint. By *J.*, or *articulation*, is meant the connection which exists between the different bones and cartilages of which a living body is composed. The form of the J. and the kind of connection between the bones entering into the J. vary, the variations depending upon the amount of movement allowed in the articulation. In some, the movement allowed is little or none, and to these the term *synarthrosis*, or *immovable* joint, has been applied; in others, a considerable amount of movement is allowed, these are called *diarthrosis* or *movable* joints. An intermediate class is formed between the two extremes, the *amphiarthrosis* or *mixed* joints. In the *immovable* joints, the bones are separated from each other only by the periosteum or lining membrane of the bone. They are not separated from each other by a synovial cavity. This kind of J. is found between the various bones which form the skull and face, with the exception of the lower jaw. In the *movable* joints the portion of the bones which enter into the articulation is enlarged and coated over with cartilage. The surfaces of the cartilages are lubricated by synovial fluid, which is secreted by the synovial membrane which envelops the articulation. The object of the cartilage and fluid is to make the surfaces smooth and diminish friction during movement. The joints which are included in this division are subdivided according to the kind of movement permitted. (1) *Arthrodia.*—Here the bones have flat surfaces, and are closely connected by ligaments. The only motion permitted is a gliding movement. The joints between the carpal bones are examples. (2) *Ginglymus* or hinge-J.—Here the surfaces of the bones are of such a shape that movements of flexion and extension only are permitted. The bones are connected by ligaments which also resist any other movement. The elbow and ankle joints, and the joints of the fingers may be taken as typical examples. (3) *Enarthrosis* or ball and socket-joint, where movement in all directions is permitted. Here one of the bones has a rounded portion or head upon it, and it is in contact with, and moves in a depression or socket in the other bone. The ligaments are also arranged so as only to limit movement, when that movement is becoming excessive in any direction. The bones are held together by atmospheric pressure, and by the action of the muscles surrounding the J. The hip and shoulder joints are examples of this class. (4) *Mixed Joints.*—The bones entering into this form of J. are separated by fibro-cartilage, and have either no synovial membrane, or the membrane is present only in a portion of the articulation. This form of J. is found in those parts of the body where stability is required, but where some amount of motion is necessary. Thus we have examples in the articulations between the bodies of the vertebræ. Here the amount of motion between two contiguous bodies is not great, but in the column, as a whole, there is a considerable amount. This can be noted when we bend the body in order to pick up something from the ground.

Diseases of the Joints.—The various joints of the body may become the seat of disease of an inflammatory or strumous character, or of malignant degeneration; and such diseases may give rise to various morbid conditions, such as rigidity, Anchylosis (q. v.), and the formation of foreign bodies within their cavities. Until the time of the late Sir B. Brodie, D. of the J. were called by surgeons *Arthritis* (q. v.), and by the public *white swellings*. Inflammation of the synovial membrane or *Synovitis* is the most common of all the articular affections, and usually results from cold in rheumatic or syphilitic constitutions, and, in such cases, more joints than one are generally affected; but it may also be occasioned by injury, and, in such cases, the other textures that enter into the formation of the joint are usually implicated. This form may terminate in *hydrarthrosis*, or dropsy of the joint, which, in strumous constitutions, fre-

quently runs on to suppurative destruction; or the serous membrane may become lined with pendulous growths which occasionally become detached as loose substances of a fibrous structure. Adhesions are also frequently formed which result in stiffness of the joints. The symptoms of D. of the J. vary according to the joints affected and the nature of the affection; the most marked symptoms, in all cases, being pain, heat, and swelling. In the larger joints, such as the ankle, knee, and hip joints, the pain is usually very severe, and is much aggravated by motion and pressure. The mode of treatment varies in like manner, but the general indications are perfect rest; the usual means for subduing inflammation and alleviating pain in the acute stage, and in the subacute and chronic stage, rest and counter-irritants.

Joint and Several, an English law phrase meaning that an obligation is come under, or a contract entered into, by each of several parties in connection with each other, and also independently. The general rule of law in England is that unless otherwise stipulated, a contract is only *joint*, hence if an action is brought to compel fulfilment, it must be brought against all the parties bound. But where the words J. and S. are used—as, 'we A. B. and C. jointly and severally bind and oblige ourselves, or promise,' &c.—then the holder of the obligation may sue A. B. or C. alone, the party sued having a claim of relief against the others. In Scotland, the general rule of law in *joint* obligations is that each debtor is bound *pro rata* only; but where each is bound *conjunctly and severally*—the Scotch equivalent to J. and S.—then each is liable *Singuli in Solidum*, and the creditor may exact full performance from one, or from any number he chooses proportionally, leaving them to account with one another.

Joint Fir. See SEA GRAPE.

Joint-Stock Companies, Law Regarding. The principle of limited liability among the members of J.-S. C. was first introduced by the Act 18 and 19 Vict. c. 133. At that time there were various statutes affecting the incorporation, regulation, and winding-up of trading companies. These were consolidated and amended by the Companies Act of 1862, which was again amended by the Act of 1867. By these statutes, seven or more persons associated for any lawful purpose may, by subscribing their names to a memorandum of association, form an incorporated company with or without limited liability. An annual list of the members of a company is to be forwarded to the registrar of J.-S. C., and the list is to be open to public inspection. Provision is made to protect the public from adventurers getting up companies, to punish delinquent directors, and to prevent their flight. And though the offence of a delinquent director or other official of a joint-stock company is one for which the offender is criminally liable, he may be compelled to pay a sum to the company as compensation for his misconduct. It not unfrequently happens that in launching joint-stock adventures delusive prospects of gain are held out to induce the public to join in them. When any one has thus been misled by a statement distinctly untrue, the Chancery division will annul the contract; but some latitude of statement is allowed, according to the decision in the case of Kisch *v.* The Central Railway Company of Venezuela. Lord-Justice Turner said that it was unfortunately universally known that the prospectus of a company never contained an accurate account, so that the validity of a bargain founded on such a document could not be tried by so strict a test as another kind of bargain could be tried by. A mere exaggerated view or casual inaccuracy in a prospectus would not justify the setting aside of a bargain founded on it. On the other hand, the Court required that where a contract was founded on the statement of one of the parties to it, that statement should be *bonâ fide*. By sec. 4 no partnership of more than ten persons is to be formed for banking purposes unless it is registered under the Act, or is formed under some other statute or letters-patent. Nor is any partnership of more than twenty persons to be formed for the purpose of gain, unless it is registered or is formed under an Act of Parliament or letters-patent, or constituted for the working of mines within the jurisdiction of the Stannaries (q. v.). A partnership of fewer than twenty persons is not bound to register, but it may do so with or without limited liability. Petitions to wind up companies must be presented in England to the Chancery division, who may refer the question to the Court of Bankruptcy. The Act applies to the United Kingdom, being in Scotland adapted to the legal institutions of that kingdom. See PARTNERSHIP, LAW REGARDING.

Joint-Tenancy. See under COMMON—COMMON, TENANCY IN.

Joint Trade, or **Adventure**, is a partnership for a special object, as for the working of a mine. The rights and liabilities of such a partnership depend mainly on the terms of the contract. But the personal creditors of one partner cannot appropriate the joint-stock to his own payment until the debts of the concern are paid and the other partners have received their shares. See PARTNERSHIP, LAW REGARDING.

Join'ture, in English law, is a provision made for a wife in the event of her surviving her husband. If the J. be provided after marriage the wife may either accept it or claim her *Dower* (q. v.), (see also BAR OF DOWER). A J. is not forfeited by the adultery of the wife as dower is. In Scotch law the word is used in a similar sense.

Joinville, Jean, Sieur or **Sire de**, descended from one of the most illustrious families of Champagne, was born (1224) in the district of Châlons-sur-Marne, was early attached to the court of the King of Navarre, joined a crusade with St. Louis (1248), engaged in many battles, and returned (1254), married Alix de Resnel (1261). J. declined to follow the king on the crusade of 1270 on the plea that when he was beyond sea his people were compelled to suffer too many hardships at the hands of the King of Navarre. Even in his ninety-second year J. obeyed the summons to appear in the battle-field, and he lived through the reigns of six kings. M. Francisque Michel thinks it probable that he died in 1317. In 1853 a bronze statue was erected to his memory in the town which bears his name. Medieval literature furnishes no history exactly comparable to J.'s *Histoire de St. Louis* for simplicity of narrative, naïveté of detail, and sober truthfulness of method. See Max Müller's *Chips from a German Workshop*, vol. iii. p. 159.

Joists. See FLOORS.

Jol'iet, a city of Illinois, U.S., on the Aux des Plaines River and the Illinois and Michigan Canal, 36 miles S.W. of Chicago by rail. It is the seat of the state penitentiary, perhaps the largest institution of the kind in the country, usually containing 1300 convicts, who are employed industrially. J. has an immense iron and steel work (employing some 2500 men), large building-stone quarries, cement works and brickfields. It is near the Wilmington coalfields, and draws an abundant water supply from sixteen artesian wells. Pop. (1870) 7263.

Jolly-Boat (a corruption of *yawl*-boat, comp. Dutch *Jol*, Ger. and Dan. *Jolle*), a small broad boat used by ships' stewards for communicating with the shore.

Jomini, Henri, Baron, a distinguished soldier and military author, was born at Payerne, Switzerland, March 6, 1779. He joined the French army and served under Ney in Germany in 1805, in which year he published his *Traité des Grandes Opérations Militaires*. He was made a baron for gallantry at Jena, after which he served in Spain and Russia. Badly treated by Napoleon, he went over to the allies, became a Russian general, and fought in the Turkish war of 1828. He retired to Brussels in 1855, and died at Passy, March 24, 1869. J. wrote many military works of great excellence, and the *Vie de Napoleon* (4 vols. 1827).

Jo'nah (Heb. 'dove'), a Hebrew prophet, who lived not later than the reign of Jeroboam II. (B.C. 824–783; 2 Kings xiv. 25). If therefore the opinion that the Book of J. was composed by the prophet himself were correct, it would be one of the oldest prophetical writings which have been preserved. Some maintain the historical nature of the book without reference to the writer or date of composition. The language used by Christ (Matt. xii. 39–41; xvi. 4; Luke xi. 29) is felt by many to compel the adoption of this view. Others, however, find difficulties in the way of regarding it as pure history: (1) in the improbability that the whole of the inhabitants of Nineveh should immediately have felt such remorse at the call to repentance of an unknown foreigner, there being besides no trace of the event in the history of the city; (2) in the fact that the name of the king in whose time it happened is not mentioned; (3) that J. should not only live seventy-two hours in the belly of a fish, but in that position compose a psalm, which it is distinctly stated he did (ii. 2–9); and maintain that the aim of the book was to teach, in opposition to the narrow-minded idea of the Jews, that Jehovah was

the God of their nation alone, that he embraces all nations within his fatherly love.

Jones, Ernest, Chartist and poet, was born 25th January 1819 at Berlin, his father, Major J., residing in Holstein as aide-de-camp to the Duke of Cumberland. Educated at the Lüneburg Gymnasium and the University of Göttingen, he was called to the bar by the Society of the Middle Temple, April 19, 1844, but devoting himself to Chartism (q. v.), became editor of three of its organs, stood unsuccessfully for Halifax (1847), and in 1848 was sentenced to two years' imprisonment for a seditious speech delivered at a monster Chartist meeting held on Kensington Common. In prison he wrote with his own blood on the flyleaves of a prayer-book—so he tells us in the dedication—*The Revolt of Hindustan* (1857). He published several other poems, besides three volumes of tales, travelled the northern circuit, contested Nottingham in 1853 and again in 1857, and Manchester (where he resided) in 1868, but always without success, and died at the latter place, January 26, 1869.

Jones, In'igo, the father of modern English architecture, was born in London in 1572. He studied in Italy, and in 1605 returned to England, where he designed the scenery of the court masques of James I. While thus engaged he excited the antagonism of Ben Jonson, but had the royal favour. After some years of further study in Italy, he finally took up his residence in London. Among his finest efforts are the noble Banqueting House at Whitehall, and the front of Wilton House. He designed the Corinthian Portico of St. Paul's, the Covent Garden Piazza, Heriot's Hospital, Edinburgh, and many fine buildings. His unfulfilled plans for a gigantic palace for James I. were published in 1727. He died June 1653. J. was a follower of Palladio. See Memoirs of his Life, by Peter Cunningham.

Jones, Owen, the Mæcenas of Welsh literature, was born in the Vale of Myvyr, Denbighshire, in 1741, and came early to London, where he made a considerable fortune as a furrier in Thames Street, and where he died September 26, 1814. He founded the Gwyneddigion Society (1771), published an edition of the poems of Davydd ab Gwilym (1789), the *Myvyrian Archæology of Wales* (3 vols. 1801–7), &c., and formed a collection of transcripts of ancient Welsh MSS. (50 vols. 4to.), which is now in the British Museum.

Jones, John Paul, a famous buccaneer, son of a gardener named Paul, was born at Arbigland, Kirkcudbright, North Britain, July 6, 1747. He went to sea at twelve, and in 1773 settled in Virginia under the name of Jones. Shortly after the outbreak of the war with Great Britain, he obtained the command of an American ship, and made great havoc of British commerce. In April 1778, he landed by night at Whitehaven, plundered the house of the Earl of Selkirk, and seized 200 prisoners. Next year he threatened Leith, but was driven back by a gale, when he captured the *Serapis*, a British frigate, off Flamboro'. After the war, he was for some time an Admiral in the Russian navy. He died in Paris, July 18, 1792. J. was fiery, impetuous, and boastful. The *Mémoires* which appeared at Paris in 1789 (Edinb. 1830) are of doubtful authenticity. See the Biographies by Sherburne (Wash. 1826), Simms (New York, 1845), J. S. C. Abbott (New York, 1875).

Jones, Sir William, next to Colebrooke the greatest English Orientalist, was born in London, 28th September 1746, was educated at Harrow and Oxford, and was tutor to Lord Althorp, son of Earl Spencer, from 1765 to 1770. He devoted himself early and eagerly to the study of Oriental languages, and published a French translation of a Persian *Life of Nadir Shah* (1770); a *Persian Grammar* (1771); *Commentaries on Asiatic Poetry* (1774), and translations of seven Arabic poems under the collective title *Modllakat* (1780). Called to the bar in 1774, he issued several legal essays, and was appointed a judge in the Supreme Court of Judicature in Bengal in 1783. In 1784 he founded the Asiatic Society at Calcutta, of which he was the first president, and to the transactions of which he was a voluminous contributor. His later works were a translation from Sanskrit of Kâlidâsa's play of *Sakuntala*, one of the finest gems of Eastern Literature, and a masterly translation of the *Laws of Manu* (1794), extracts from the Vedas, and tales, poems, and legal works from the Indian languages. While busy with a digest of Hindu and Mohammedan laws, he died at Calcutta, 27th April 1794. His writings are marked by a highly cultivated taste, and a singular power of assimilating the exotic beauty of Eastern poetry. But his studies rather bespeak the æsthetic devotion of the litterateur than the severe critical labour of the scholar. 'The really difficult works, the grammatical treatises and commentaries, the philosophical systems, and, before all, the immense literature of the Vedic period, were never seriously approached by him' (Max Müller). Colebrooke, however, was in greatest measure indebted to him, and he certainly gave an incalculable impulse to Oriental scholarship. An edition of his works in 6 vols. was issued by Lady J. in 1799, and another in 13 vols. with a *Life* by Lord Teignmouth, in 1807.

Jone'sia, a genus of trees found in the Malay Peninsula, Japan, &c., belonging to the same family as the laburnum. They have large glossy leaves, a foot or more long, and clusters of bright scarlet flowers, and are named after the great Oriental scholar.

Jongleurs. See TROUVERES and TROUBADOURS.

Jönköping, a town in the district of Smaaland, Sweden, has manufactures of lucifer matches, paper-hangings, and hardware. Pop. (1871) 11,254. J. was a trading town as early as the 13th c., and was fortified till the middle of the 17th c. It has been several times burnt.

Jon'quil, a common garden plant, is a species of Narcissus (q. v.) or daffodil, with *rush*-like leaves (Lat. *juncus*, 'a rush'). A fine perfume is extracted from its flowers.

Jon'son, Ben, playwright and lyrist, was born at Westminster in 1573, a month after the death of his father, a clergyman of Scottish descent. Through the kindness of Camden he received a free education at Westminster School, but being removed thence at an early age, he was for a while apprentice to a bricklayer, then saw a few months' service in the Netherlands, and finally obtained an engagement at the Curtain Theatre in Shoreditch as player and dramatist. His works of this period are lost, and we know little of his life, beyond that he married a shrewish wife, probably in 1592. Next, from an entry in Henslowe's diary (July 28, 1597), he seems to have made one of the Rose company, and then we follow him to the Globe, where his *Every Man in his Humour* was brought out in 1598 on the recommendation of Shakespeare, and was followed by its inferior antitype, *Every Man out of his Humour*. For slaying an actor of the Rose, one Gabriel Spencer, in a duel (1598), he was imprisoned, in prison turning Catholic, and on his release engaged in a string of squabbles with the playwrights of that theatre. J.'s *Cynthia's Revels* (1600) and *Poetaster* (1601) evoked Dekker's *Satiromastix*, in which our poet's origin and history are handled with Aristophanic licence. His first tragedy, *Richard Crook-back*, was acted in 1602, and the year after appeared *Sejanus*, which he is supposed to have written in conjunction with Shakespeare. For the first two years of James's reign he confined himself to the production of masques, but a comedy, *Eastward Ho* (1604), the joint work of J., Chapman, and Marston, caused the arrest of its authors for reflections on the Scotch, and they narrowly escaped the slitting of ears and noses. The next few years of J.'s life yielded nine plays and masques, witnessed his return to Protestantism, and marked the zenith of the Mermaid Club, composed of Shakespeare, J., Beaumont, Fletcher, and others. In 1613 J. went to France as tutor to Sir Walter Raleigh's son, and on his return published *Bartholomew Fair* (1614), and *The Devil's an Ass* (1616). He had already issued a book of *Epigrams* and *The Forest*, and now for nine years withdrew from dramatic labours, in 1618 paying his memorable visit to Drummond of Hawthornden; but in 1619 he received the degree of M.A. from the University of Oxford, and from the king the poet-laureateship, with a pension of 100 marks. His wife was dead, a precious library destroyed by fire, and J., quitting his old Bankside residence, established himself outside Temple Bar, near the Devil Tavern, where he founded the new Apollo Club, with Herrick, Suckling, Carew, and all the list of poets 'sealed of the tribe of Ben.' Up to James's death J. wrote but one yearly masque for the Court Twelfth Night revels, but then he had once more to turn to the theatres for support. But, enfeebled by palsy, his hand had lost its cunning. His last plays, *The Magnetic Lady* (1632) and *Tale of a Tub* (1633) are 'poor dotages,' and their author, pursued by ancient feuds, died August 6, 1637. He was buried in Westminster Abbey, in an upright position, on his grave the words, 'O rare Ben

Jonson.' J.'s plays, as we have them, are sixteen in number, his masques thirty-five. To the comedies already cited must be added *The Silent Woman* (1603), *Volpone* (1605), and *The Alchemist* (1610). These all are like himself, with his 'mountain belly' and his 'rocky face'—great but gross, full of shrewd insight and vigorous common sense, but wanting in fineness of thought and human sympathy. In the realm of pure fancy, as in *Cynthia* and the unfinished fragment, *The Sad Shepherd*, J. rises to higher things; but his tragedies, based closely on the classic models, are imitative rather than assimilating. His truest fame rests on his lyrics, which, always beautiful, are often unsurpassed. *Drink to Me Only with Thine Eyes*, *See the Chariot*, with the epitaphs on Lord Herbert and the Countess of Pembroke, can never die. The best edition of J.'s works is that by Gifford, republished with introduction and appendices by Lieut.-Col. Cunningham (9 vols. Lond. 1875).

Joonaghur' (Junaghar). The chief town of the native state of the same name in Kattywar, India, 235 miles N.W. of Bombay, and 150 W. of Surat. Pop. (1872) 20,025. It is a meanly-built town, with a wall 5 miles in circumference; it contains a strong citadel, and a handsome mosque with pillars of granite and a pulpit of marble.—The *state* of J., which ranks first in Kattywar, has 890 villages; pop. (1872) 380,921; revenue, £150,000; tribute, £7000. Within its boundaries lie the sacred mountain of Girnar (q. v.), the old temple of Somnauth, and the port of Verawal. The ruling Mohammedan dynasty established itself over the Rajputs in 1735. The treaty with the English dates from 1808; and a second treaty regarding shipping was agreed to in 1846. The present (1877) Nawaub, an enlightened prince, is a K.C.S.I.; he receives tribute from several minor chiefs in the Kattywar peninsula.

Jopp'a (Heb. *Yapho*, 'beauty'), a sea-port about 34 miles N.W. of Jerusalem, according to Josephus originally belonged to the Phœnicians (*Ant.* xiii. 15, 4). It is first mentioned in the Bible as being in the portion of Dan (Josh. xix. 46). Here the timber for Solomon's temple, as well as for Zerubbabel's, was landed when brought from Lebanon (2 Chron. ii. 16; Ezra iii. 7). Here Jonah took ship 'to flee unto Tarshish' (Jonah i. 3); as, according to Strabo (*Geogr.*), Andromeda was exposed to the whale at the same place. And here St. Peter had his famous vision (Acts x. 9–16). The modern Jaffa, which between crusaders and infidels underwent as many vicissitudes as Jerusalem itself, is a town of 15,000 inhabitants. In 1875 its exports (wheat, barley, sesame, olive oil, soap, and oranges) amounted in value to £258,156; and the imports (rice, coffee, sugar, cottons, and timber) to £110,667.

Jor'daens, or **Jordaans, Jakob**, a Flemish painter and engraver, born at Antwerp 19th May 1594, died in 1678. He was a pupil of Adam van Oort, for whose daughter's sake, it is said, he refrained from going to Italy, contenting himself with copying the works of the Italian masters that he found in the Netherlands. He was a friend of Rubens. As a colourist J. has even been compared with that painter; but is without taste in design. His greatest pictures are at Paris and Dresden.

Jor'dan (Heb. *Yarden*, 'the descender'), which forms the eastern boundary of Palestine, and for its size is perhaps the most famous river in the world, takes its rise from a number of streams which burst from the slopes of Lebanon and Hermon. The united stream flows through the Lake Merom (mod. *el Huleh*), and southwards to the Lake of Tiberias (q. v.), the distance between the lakes being 9 miles, and the fall about 600 feet. Still flowing nearly due S., in 60 miles of latitude, but in an actual course of 200 miles, it falls into the Dead Sea (q. v.), which is about 650 feet below the level of the Lake of Tiberias, and 1317 below that of the Mediterranean.

Jornan'des, or **Jordanes**, a Goth, who was state secretary to the king of the Alani in the time of the Emperor Justinian. Adopting Christianity, he took orders and became a bishop, some say of Ravenna in Italy. J. is the author of two Latin works, *De Getarum* (*Gothorum*) *Origine et Rebus Gestis*, giving the history of the Goths down to the submission to Belisarius in 541 A.D., a work of immense value in spite of its blunders (best edition, that of Closs; Stuttg. 1861); and *De Regnorum ac Temporum Successione*, an abstract of general history down to 552, with some valuable information about northern nations.

Jor'tin, John, D.D., an English divine and author of Huguenot descent, was born at London, October 23, 1698. Passing from the Charterhouse to Jesus College, Cambridge, he gained a fellowship in 1719, and was ordained priest in 1723, having already published a volume of Latin poems, *Lusus Poetici* (Camb. 1722). In 1727 he accepted the college living of Swavesey, Cambridgeshire, but resigned it the year following, and repairing to London soon attracted notice by his eloquent sermons. After holding the rectories of St. Dunstan-in-the-East (1751) and Eastwell in Kent, he was appointed in 1762 domestic chaplain to Dr. Osbaldeston, Bishop of London, who also gave him a prebend of St. Paul's, the living of Kensington, and in 1764 the archdeaconry of London. He died September 5, 1770. Besides sermons, J. published eleven works, which have been issued in a uniform edition, and of which may be noticed *Remarks on Ecclesiastical History* (3 vols. 1751–54), *Life of Erasmus* (2 vols. 1758–60), and *Remarks upon the Works of Erasmus* (1760).

Jorull'o, a volcano of Mexico, in the state of Michoacan, 150 miles W.S.W. of Mexico city. From a plain 2880 feet above the sea, J. was suddenly thrown up to a height of 4265 feet on 8th September 1759. But several of its many cones soon sank, and of those still remaining only a few discharge even vapour. The sides of J. are clad with forests.

Jo'seph I., son of Leopold I., German Emperor, born at Vienna, July 26, 1678, was crowned hereditary prince of Hungary, 1687, King of the Romans in 1690, and Emperor in 1705. J. carried on the paternal wars against Bavaria owing to the Elector's sympathy with France, but his antipathy to the latter country came to an end (1707), after which he presented his brother, Charles II. of Spain, with Milan. J. was an ambitious but prudent emperor, who worked a useful reform in fiscal law, and established the Chamber of Justice. He died April 17, 1711.—**Joseph II.**, eldest son of Franz I. and Maria-Theresa, was born at Vienna, March 13, 1741. He was early placed under the tuition of Count Batthyany, a Hungarian, and, though naturally timid, showed a leaning towards arms which his mother repressed. In 1760 he married Isabella, eldest daughter of Philip of Parma; in May 27, 1764, was elected King of the Romans at Frankfurt; became Emperor 18th August 1765; and married Marie Joseph, daughter of Karl VII., 28th May 1767. He tried in vain to wrest the complete power out of his mother's hands, being first of all entrusted only with the armies. Then he inculcated economy in all branches, setting the example by the simplicity of his own surroundings. Having begun a course of travels (1764) through Hungary, he returned thither (1768), went to Rome incognito (1769), travelled through Bohemia, Moravia, and his own dominions (1772), and arrived in France (1777), where he was but coldly received by his brother-in-law, Louis XVI. After the death of Maximilian-Joseph of Bavaria, J. attempted a war of aggrandisement in his territory, known as 'the Potato War,' that brought small results, owing to the opposition of Friedrich the Great and the lukewarmness of Maria-Theresa. In other efforts of the same kind he was not more successful, but his domestic policy was most beneficial. He introduced various ecclesiastical reforms, mitigated the condition of the Jews, equalised the administration of justice, and introduced comparative freedom of worship. He died 20th February 1790. See Pezzl, *Characteristik J.'s II.* (Vien. 1790); Gross-Hoffinger, *Lebens- und Regierungs-geschichte J.'s II.* (4 vols. Stuttg. 1835–37); Paganel, *Histoire de J. II.* (Par. 1843); Burckhardt, *Kaiser J. II.* (Meissen, 1835); Heyne, *Geschichte Kaiser J.'s II.* (Leips. 1848); Arneth (1867–69).

Jos'éphine, Marie Joseph Rose, was born at Trois-Ilets in the island of Martinique, June 23d, 1763, educated in the convent of Port Royal, landed in France (1779), and married Alexandre, Marquis of Beauharnais. He proved faithless to her after the first year, and in 1788 she returned to Martinique with her daughter Hortense, rejoined him in 1790, and lived with him until he was executed by order of the Convention, May 5, 1794. Two years later she married General Bonaparte, and in 1800 went to live at the Tuileries, and organised state receptions with great success, her personal qualities of refinement, taste, and amiability showing to perfect advantage. J. became empress 28th November 1804, her son Eugene (by her first marriage) being appointed Viceroy of Italy, her daughter Hortense becoming

Queen of Holland. For political reasons, J., having no issue by her second marriage, was divorced by Napoleon 16th December 1809. Towards the end of 1811 she took up her residence at Malmaison, giving full scope to her taste for art, botany, and natural history, and died May 29, 1814. J. was kind, timid, luxurious, and a little deceitful, but merited better things at the hand of the Emperor. See Aubenas, *Histoire de l'Impératrice Joséphine* (1857–59).

Jose'phus, Flavius, the Jewish historian, was born at Jerusalem A.D. 37. If his own account, the only authority we have, is to be believed, at the age of fourteen he was a prodigy of learning. At the age of sixteen he set out for Rome to plead the cause of some imprisoned Jewish priests. He suffered shipwreck on his voyage, and had a narrow escape from drowning, but reached his destination in safety, and through the patronage of Poppæa gained his cause. The Jewish war against the Romans broke out (66) soon after his return, and although he was opposed to the insurrection, he accepted the command in Galilee. Having fallen into the hands of the Romans on the capture of the town of Jotapata, which he was defending, his life was spared, but he was kept in captivity till Vespasian's elevation to the throne, which he had predicted, took place (70). J. was with Titus at the siege of Jerusalem, and afterwards accompanied him to Rome, where he spent the rest of his life (died about 100) kindly treated by Vespasian, Titus, and Domitian, and occupied in writing his various works. These are:—*A History of the Jewish War* (from the capture of Jerusalem by Antiochus Ep. B.C. 170), first written in Hebrew and then translated into Greek; *The Jewish Antiquities*, a history of the Jews from the Creation to A.D. 66; an *Autobiography*; and a *Treatise against Apion*, on the antiquity of the Jewish nation. The best editions of J.'s works are by Havercamp (2 vols. Amst. 1726), Oberthür (3 vols. Leips. 1782–85), and Richter (6 vols. Leips. 1825–27).

Josh'ua (Heb. *Yehoshua*, 'whose help is Jehovah'), formerly called Hoshea ('deliverance,' Num. xiii. 8, 16), the son of Nun, of the tribe of Ephraim, was appointed by Moses general of the army of Israel when they were attacked by the Amalekites at Sinai (Exodus xvii. 9), one of the spies for exploring Canaan (Num. xiii.), and finally to lead the people into Canaan after his own death (Num. xxvii. 18–23, Deut. xxxi. 14, 23). After fulfilling the task entrusted to him with valour and discretion (see JEWS), he died at the age of 110 (about B.C. 1427), and was buried at Timnath-serah (Josh. xxiv.). The book of J., which contains an account of the conquest of Canaan by the Israelites, and its division among the twelve tribes, was supposed by most Jewish and early Christian writers to have been composed by J. himself, some maintaining the same thing yet. But its composition has been ascribed by others to one of the elders who survived J., to Eleazar, to Phinehas, to Samuel, and to Jeremiah; to some one in the time of Saul, of Josiah, or even after the Babylonish Captivity.

Josi'ah (Heb. 'Jehovah heals'), the son of Amon, King of Judah, succeeded his father on the throne at the age of eight (about B.C. 640), and reigned thirty-one years, when he met his death in a battle with Pharaoh-necho, whose march against the Chaldeans he attempted to check. Brought up under the influence of a circle of remarkable persons—Shaphan the scribe, Hilkiah the high priest, and Huldah the prophetess—he zealously seconded their desire for a religious reformation. Hilkiah had found a copy of the Book of the Law, which had a great effect both on the king and the people, being as completely strange to them as if it had never existed before, which indeed some affirm to have been the original form of the Book of Deuteronomy and composed at that time. At any rate, J. repaired the temple of Jehovah, established his worship as the national religion, and caused all High Places (q. v.), Asheras (q. v.), and every trace of worship paid to any of the other Semitic deities, to be destroyed.

Jósika, Miklos (*Nicholas*), a Hungarian novelist, born of a noble family at Torda in Transylvania, 28th September 1796. In 1834 he appeared in the Transylvanian diet in the ranks of the opposition, and took part in the political movements in Hungary from 1835 to 1840. In 1836 he produced the tale *Abafi*, and continued till 1848 to publish as many as sixty novels on subjects drawn from Hungarian history. Of these, the most famous are *Az Utolsó Bátory* (1838), *A Csehek Magyarországban* (1840), *Josika Istvan* (1847). J. acted in 1847 as Transylvanian deputy for the political union of Transylvania and Hungary, took part in the Revolution of 1848, but was forced to fly, and took up his abode in Brussels in 1850. Of his later romances the chief are *Esther* (1853) and *A Négyáriak* (1865). He died at Dresden, February 27, 1865. J. resembles his model, Scott, but has quite an original freshness and colour.

Jost, Isaak Mark, a German Jew, born at Bernburg 22d February 1793, was a second Josephus. Though born of poor parents, by extraordinary diligence he acquired an excellent education, and great proficiency in the Semitic as well as in the classical and modern languages. He taught a school at Berlin for seventeen years (1816–33), and the Jewish High School at Frankfort from 1835 till his death 25th November 1860. His chief works were *Geschichte d. Israeliten* (9 vols. Berl. 1820–28); an abridgment of the above, *Gesch. d. Isr. Volkes* (2 vols. 1831–32); a continuation, *Neuere Gesch. d. Isr.* (1866–67); and *Gesch. d. Judenthums* (3 vols. 1857–59), embodying all the results of his life's work.

Joudpore. See JODHPORE.

Jouffroy, Théodore Simon, a French philosopher, was born in the hamlet of Pomtets, on the heights of the Jura, 7th July 1796, went to Paris in 1813 to the Normal School, accepted with M. Cousin the Royalist restoration 'as more favourable to thought than the empire,' became attached (1822) to the Bourbon College, having previously composed two theses, *Le Beau et le Sublime* and *La Causalité*. In 1824 he joined the staff of *Le Globe*, and took his place on it as 'le philosophe generalisateur,' besides contributing articles upon history and geography. His collected writings consist of translations from the Scotch philosophers Stewart and Reid, a volume of *Mélanges Philosophiques* (1833), and *Nouveaux Mélanges* published after his death. He died 4th February 1842. Like Coleridge, J. projected several works which he never completed, and to a power of profuse meditative conversation he added the affliction of great literary indolence.

Jougs, Juggs, or **Joggs** (Fr. *joug*, Lat. *jugum*, allied to the Eng. *yoke* and Ger. *joch*), the name of an instrument of punishment used in Scotland at least as early as the 16th c., consisting of an iron collar suspended by a few links of chain in some public place, and fitted with a padlock for fastening it upon an offender's neck. They were sometimes accompanied with the Branks (q. v.). J., which have also been used in Holland, and probably in other countries, have not been employed in Scotland for a century, but are still occasionally seen hanging at country churches—*e.g.*, at Duddingstone, near Edinburgh.

Joule, James Prescott, F.R.S., D.C.L., &c., a celebrated living physicist, was born at Salford, near Manchester, December 24, 1818. Though associated in business with his father till 1854, he early turned his attention to science, and finally became as enthusiastic and careful an experimenter as his teacher Joseph Dalton (q. v.). At the age of nineteen, he constructed an electro-magnetic machine; and in 1840 he was led into a series of experiments to determine the law regulating the evolution of heat by an electric current. This resulted in obtaining in 1843 a first approximation to the dynamical equivalent of heat, and suggested that brilliant series of experiments which established the true theory of heat and the doctrine of the conservation of Energy (q. v.), and obtained for the investigator a world-wide reputation. He has since made valuable experimental researches into the thermal conditions of fluids under various circumstances. He received the royal medal from the Royal Society in 1852, and the Copley Medal in 1860, in recognition of his valuable services to science. He is a member of all the principal scientific societies both at home and abroad. He was president of the British Association in 1873, and in 1875 was made doctor of mathematics and physics by the University of Leyden. His numerous memoirs are published in the *Philosophical Transactions*.

Jounpore' (*Jaunpur*), the chief town of the district of the same name, N.W. Provinces, British India, on both banks of the Gumtee River, 55 miles N.E. of Allahabad. Pop. (1872) 23,327. The town contains a stone fort, a handsome mosque, and many ruins; the river, which is navigable, is crossed by an ancient bridge.—The *district* of J. has an area of 1556 sq. miles; pop. (1872) 1,025,961. The soil is fertile, and irrigated from wells.

Jour'dan, Jean Baptiste, Comte, son of a surgeon, was born at Limoges, 29th April 1762, entered the army (1778), made five campaigns in America, and rose to be General of Division (July 1793). He commanded the French army of the N., and won the battle of Wattignies. In 1794 he commanded with success the army of the Moselle and the army of the Sambre and Meuse, gaining (26th June) the battle of Fleurus. J. was checked by the Archduke Karl in Germany (1796), and owing to his reverses was compelled to resign his post. He became a member of the Council of Five Hundred (1797), carried the law of conscription (September 5, 1798), and was excluded from the Chamber, having opposed the dictatorship of Napoleon. He accompanied Joseph Bonaparte into Spain, and fought against Wellington. Louis XVIII. made him a Comte, and he took his place as a constitutional politician. He died November 23, 1833.

Joust, or **Juste** (Old Fr. *jouste*, Ital. *giostra*), is defined by Ducange as a single combat or duel, while a tournament was an encounter of two troops of combatants; but the distinction seems to be an arbitrary one, and the terms are used synonymously by old writers.

Jowar' (*Jawar*), the chief town of the native state of the same name, in India, 68 miles N. of Bombay. It is an insignificant place, lying within the British district of Tanna. The *state* of J. has an area of about 534 sq. miles; pop. (1872) 37,406; revenue about £6000; no tribute is demanded, but a nuzzurana or relief of £2000 is paid to the British on the accession of the Rajah. Timber is the most valuable of the productions. The dynasty is said to have been very powerful when founded 500 years ago. The present Rajah, a minor, is now (1877) being educated at Poonah.

Jow'ett, Rev. Benjamin, D.D., an English scholar and theological critic, born at Camberwell in 1817, was educated at St. Paul's School, London, and became a student of Balliol College, Oxford, in 1835, a fellow in 1838, and tutor in 1842, in which year he was also ordained. In 1853 he served on and compiled the report of a commission to consider the application of the competitive system to the Indian civil service, of which Macaulay and Lord Ashburton were also members, and in 1855 was appointed, through Lord Palmerston, Regius Professor of Greek. An article by J., *On the Interpretation of Scripture*, in the famous *Essays and Reviews* (1860), led to his trial and acquittal in the Vice-Chancellor's court on a charge of heresy. In 1870 he succeeded Dr. Scott as Master of Balliol, and in 1875 received from the University of Leyden the honorary degree of D.D. J. has published a commentary on three of the Pauline epistles (1855), a translation of the *Dialogues of Plato* (4 vols. Oxf. 1871; 2d ed. 5 vols. 1876), and an edition of the *Republic*. He is a refined, subtle, suggestive, but inconclusive thinker.

Jow'rah (*Jaura*), the chief town of the native state of the same name in Central India, on the Piria river, 260 miles S.W. of Gwalior, and 94 N.W. from Mhow. The river is here crossed by a handsome bridge of porphyritic stone. The *state* of J., which is the second Mohammedan power in Central India, has an area of 872 sq. miles; pop. about 85,000; revenue, £65,524; tribute, £15,902. The best Malwa opium is grown here to the amount of 100 chests a year. The Nawab is descended from a leader of Pindari marauders.

Ju'an, the Spanish form of John. **Don Juan of Austria** was the illegitimate son of the Emperor Karl V. and Barbara Blomberg, born 24th February 1546. After his father's death he was recognised by his half brother Philip II., and thereafter educated along with the Prince of Parma and the infante Don Carlos. The loyalty with which he tracked out Don Carlos' political intrigues procured him the command of a fleet of galleys for the defence of the coast against the African pirates, and of an army with which he crushed the Moorish rising in Granada (1569–70). His greatest exploit was the victory of Lepanto (7th October 1571), in which he defeated and partly destroyed the Turkish fleet. In 1573 he besieged Tunis, and two years afterwards was sent to the Netherlands as Stadtholder, where (31st January 1578) he gained the victory of Gemblours, but died during the siege of Namur on the 1st October of the same year.

Juan, Don. See DON JUAN.

Juan Fernan'dez, an island in the S. Pacific, situated in 33° 37' S. lat., 78° 53' W. long., about 360 miles from the coast of Chili, to which it belongs. It is 18 miles long and 6 broad, and very mountainous, the highest peak reaching an elevation of 3000 feet. The island is leased by a Chilian merchant, who employs the inhabitants (about forty in number) in cutting wood, herding cattle, and seal-hunting. J. F. produces excellent timber, and abounds in fruit and vegetables, on which account it is a favourite place of call for ships requiring fresh provisions. It is chiefly known as having been from 1704 to 1709 the solitary residence of Alexander Selkirk, a Scotch sailor, who was the original of Defoe's *Robinson Crusoe*. An iron tablet to his memory was erected on the island in 1868 by the officers of H.M.S. *Topaze*. See Spry's *Cruise of H.M.S. Challenger* (1876).

Juar'ez, Benito, President of Mexico, was of Indian extraction, and was born at Ixtlan, 21st March 1806. After filling various legal offices he became Governor of Oxacaca in 1848. He was banished by Santa Anna in 1853. On the latter's downfall he was made President of the Supreme Court, and succeeded Comonfort as President of Mexico in 1858. The clerical party, first under Zuloaga, and afterwards under Miramon, opposed him and drove him to Vera Cruz, but J. defeated them at Silva, August 14, 1860, and re-entered Mexico, January 12, 1861, where he declared the confiscation of the Church property. The suspension of payment of the State's debts brought about the armed intervention of France, Spain, and Great Britain. Negotiations at Soledad, January 19, 1862, resulted in the withdrawal of the two latter powers, but the French army remained, captured Mexico on May 31, 1863, and placed the Archduke Maximilian on the throne. J. still held out, carrying on a guerilla warfare with the moral support of the United States, and that country induced Napoleon to withdraw his troops in 1866. Maximilian was thereupon defeated and executed June 19, 1867. J. was re-elected President in October 1867, and died July 18, 1872. J. was an unusually able and enlightened governor, and his death was a national calamity.

Jubae'a. *J. spectabilis* is the coquito palm of Chili. It has a tall straight trunk 30 to 40 feet high, surmounted by a crown of large pinnate leaves. A sweet syrup called palm honey is got by boiling the sap of the tree.

Jubbulpore' (*Jabalpur* = the town on the hill), the chief town of the district of the same name, Central Provinces, British India, on the right bank of the Nerbudda, 615 miles N.E. of Bombay and 224 S.W. of Allahabad. Pop. (1872) 55,188. It has always been a centre of trade, and latterly has risen to great importance as the railway junction by which Bombay is directly connected with Calcutta and Delhi. In 1868, before the opening of the railway, the exports were estimated at £80,000, the imports at £464,000. The town itself is modern, the streets are wide and regular, and the houses well built. There is a large cantonment for all arms, and a school of industry, where tents and carpets are largely manufactured by Thug and Dacoit 'approvers.' The *district* of J., which consists of hill ranges and fertile river valleys, has an area of 3918 sq. miles; pop. (1872) 528,859. Coal and iron are both worked by European capital, and there are other valuable minerals. The forests, which are preserved by Government, furnish lac and the tussur silk-worm. The manufactures are iron, cotton-cloth, and brass utensils, in which a considerable trade is carried on, as also in raw cotton. In 1875 the imports at the railway station were 8000 tons, of which one-fourth were sugar; the exports were 9000 tons, of which one-half were cotton.

Ju'bilee, or **Year of Jubilee** (Heb. *yobel*, 'a ram,' then (meton.) 'a ram's horn,' and finally, *the sound* produced by the horn), literally the year of blowing the horn (*cf.* the day of blowing the horn, *i.e.*, the New Year, Num. xxix. 1), among the Israelites was the next year after seven Sabbatical Years (q. v.), that is every fiftieth year, in which (1) the soil had rest from tillage and harvest; (2) all the land which had been alienated reverted to the families to whom it was originally allotted; and (3) all bondmen of Hebrew blood, who had not spontaneously submitted to perpetual slavery (Ex. xxi. 6) were liberated (Lev. xxv. 8–16, 23–55). (4) Josephus (*Ants.* iii. 2, 3) declares that all debts were also remitted, and although the Bible only speaks of this in connection with the Sabbatical

year (Deut. xv. 1, 2), it seems to be implied in the J. as well, since all in bondage for debt were liberated.

Jubilee in the Romish Church is a time of indulgence in which confessors may absolve in all reserved cases from all censures, greater excommunications, suspensions from offices, benefices, and interdicts, and can commute vows, except those of religion, perpetual chastity, or pilgrimages to Rome, Jerusalem, or Compostella. Pope Boniface VIII. in the year 1300 sent an epistle throughout Christendom to the effect that in every centennial year all who should confess and lament their sins, and devoutly visit the Church of St. Peter and St. Paul at Rome, should receive plenary absolution of their sins. Plenary indulgences had hitherto been confined to the Crusaders, but the belief had long prevailed that Romish indulgences were more efficient than any others, the pilgrims who travelled to Rome for them being under the immediate protection of the Pope. Accordingly the number of pilgrims who visited Rome in 1300 was about 2,000,000. And as these had brought many gifts to the Pope and much wealth to the city, Clement VI. repeated the J. in 1350. Urban VI. in 1389 reduced the interval to thirty-three years, the length of our Saviour's life; and Nicholas V. (1447–55) appointed it to be held every twenty-five years.

Ju'dah (Heb. *yehudah*, 'praised, celebrated') was the fourth son of Jacob (q. v.) and Leah (Gen. xxix. 35). The tribe of J. was the most powerful of the Israelitish confederation, and the great rival of Ephraim (q. v.). On the death of Saul it elected David king, and eventually succeeded in establishing him as king of the whole nation. On the revolt of the other tribes under Jeroboam, it remained faithful to the house of David (1 Kings xii. 20), and constituted the kingdom of J., which outlasted that of Israel. See JEWS.

Judai'zers. See EBIONITES.

Jud'as Tree belongs to the same family as the laburnum. The purple flowers appear before the leaves, and are followed by large brown pods which remain on the tree all the year. The flowers are often pickled in vinegar. Popular legend says that Judas hanged himself on this tree, hence its name.

Jude (Gr. *Ioudas*, Heb. *Judah*), 'the brother of James' (1), who is generally understood to have been J. Lebbæus or Thaddæus (Matt. x. 3; Luke vi. 16), and 'the Lord's brother' of Matt. xiii. 55. The *Epistle of J.*, the least important in the canon of the New Testament, was one of the last to be received, and was like to have been thrown out at the Reformation. On the other hand, its very insignificance, and the absence from it of everything that could serve as a motive for forgery, are arguments for its authenticity.

Judge-Advocate-General, a civil official appointed in the reign of Charles II. to serve as public prosecutor in courts-martial, but whose functions since 1829 have been confined to acting as military adviser of the crown. Sir R. Phillimore, Judge of the Admiralty Court, was appointed, May 17, 1871, 'to hold that office until a new arrangement of its duties can be effected.' In the U.S. army the J.-A.-G. is an officer holding supreme legal authority in all military matters, who resides at Washington, bears the rank of brigadier-general, and by an Act of Congress, June 23, 1874, is assisted in his duties by four judge-advocates with the rank of major.

Judges. The judges of the superior courts in England are appointed by the Crown, and since 1688 various Acts have been passed to secure their independence in their discharge of their duties. 13 Will. III. c. 2, enacts that their commission shall not as formerly continue *during pleasure*, but during good behaviour, unless an address requesting their dismissal be presented from both Houses of Parliament. In 1825 Acts were passed to abolish the sale of offices in the Courts of Queen's Bench and Common Pleas, and substituting fixed salaries and retiring pensions. See COURT OF JUDICATURE, SUPREME ACTS. For Scotch law, see COURT OF SESSION.

Judges, Book of, records the history of the Israelites from the death of Joshua till the time of Samuel the prophet. The so-called 'judges' (Heb. *Shophetim*, 'rulers of the people'), of whom there were fifteen, including Eli and Samuel, were mostly warriors or heroes, who appeared at times of great danger and distress, and delivered the nation, or rather particular tribes, from their foreign oppressors, and 'ruled' over them for a number of years (see JEWS). The only analogy to this office to be found in any other nation is that of the Phœnician Suffetes (perhaps the same name) of Tyre and Carthage. The period covered by the book, from the sum of the dates given, is 410 years; and the 450 of Acts xiii. 20 is got by adding forty years for Eli (1 Sam. iv. 18). This, however, does not correspond with 1 Kings vi. i, where the whole period from the Exodus to the building of Solomon's temple is given as 480, and various arbitrary methods of getting over the difficulty have been resorted to.

Judgment is a term used in Christian theology; 'For we must all appear before the judgment seat of Christ; that every one may receive the things done in his body, according to that he hath done, whether it be good or bad' (2 Cor. v. 10).

Judgment.—In English law, after the verdict follows the J. of the Court. It may be suspended or arrested when there has been any defect in the trial. Cause for suspension may arise from want of due notice of trial, improper behaviour of the jury among themselves, or of the plaintiff towards them, misdirection of the judge, or exorbitant damage. On these and similar grounds a new trial may be awarded. But if two juries return the same or a similar verdict, a third trial is seldom allowed. If the J. be not appealed against, suspended, or reversed, the sentence of the law may then be put in force by *execution*. See EXECUTION, CIVIL. For Scotch law, see DECREE.

Judgment, Final. It is a doctrine of natural and revealed religion that God is the moral ruler of men, and that there is a future state of reward and punishment, in which the inequalities and anomalies here permitted shall be adjusted. The doctrine of the Christian Church regarding the F. J., which is to settle all this, is that it is a definite future event, when the eternal destiny of all shall be finally determined, that Christ is to be the judge, that it is to take place at the second coming of Christ and the general resurrection, and that the persons to be judged are men and angels.

Judi'cial Committ'ee, of the Privy Council, consists of the Lord Chancellor, Lord Justices, Lord Chief-Justices, Judges, Vice-Chancellors, Master of the Rolls, Judges of the Admiralty, Bankruptcy, and Prerogative Courts, with the bishops for ecclesiastical purposes; and two more members may be summoned by the Queen. Appeal may be taken to this Court from the Admiralty and Ecclesiastical Courts, and from the Courts of the British colonies and dominions abroad.

Judi'cial Fac'tor, in Scotch law, is an administrator appointed by the Court of Session, on petition, to take charge of the estates of minors, lunatics, or absent persons. The J. F. must in his management conform to the provisions of the Act of Sederunt, 13th February 1730, and of the Pupils Protection Act (q. v.).

Judi'cial Ratifica'tion. See RATIFICATION BY A WIFE.

Judi'cial Remit', in Scotch law, is a reference by a Court to some one specially skilled to report on a case, or on some portion of it. Matters are thus frequently submitted to accountants and engineers. *Reference to an expert to report* is the corresponding term of English law.

Judi'cial Separa'tion, in English law, is the term for the separation of a husband and wife by decree of the Court of Divorce (see DIVORCE). It may be obtained by a husband or by a wife on the ground of adultery, cruelty, or desertion without cause for two years and upwards. The legal effect of J. S. depends on the terms of the order; the judge having considerable discretion, so as to deal with a petition according to its merits. A certain income may be awarded to the wife, and her future earnings may be protected from her husband and his creditors; in which case the husband is no longer responsible for his wife's debts. J. S. does not divorce husband and wife, so that under it neither can marry again. A husband and wife are not legally entitled to live separately, except by common consent; and a voluntary separation does not affect the legal position of married persons. For Scotch law, see SEPARATION OF MARRIED PERSONS.

Ju'dith, Book of, is one of the Old Testament apocryphal writings, and narrates the exploit of a Jewish widow of Bethulia, who by slaying Holofernes, an Assyrian general invading Judæa,

was the means of freeing her country from the impending danger. The historical difficulties of the book have led commentators to treat it either as pure fiction or allegory—making the widow to be the Jewish nation (Heb. *Jehudith*), or at most to be only founded on fact.

Jugg'ernauth (Jagannath, 'the Lord of the World'), the title by which the Hindu god Vishnu is worshipped at the town of Puri in Orissa, which town is often called, though erroneously, by the same name. The shrine here is among the most popular places of pilgrimage in all India; the annual attendance having been estimated at 300,000; the annual revenue of the priests, &c., at £67,000. The great pagoda, which is thought to be nearly 700 years old, is 200 feet high, and is conspicuous from the sea. The idol consists of a log of wood, painted blue, without hands or feet. It is waited upon as if it were a living being, and is supplied daily with food, &c., of the richest kind. The car festival, which takes place annually in March, attracts 100,000 devotees. The ceremony consists in drawing the god to his country seat. The vulgar stories of deliberate self-immolation committed on this occasion are gross exaggerations; but it would be difficult to over-estimate the sum of deaths caused by the diseases engendered among the vast assemblage. It has been stated that 10,000 pilgrims die yearly, despite all the efforts of the British administration; and that cholera may be dispersed from this centre over the rest of the globe. See Dr. W. Hunter's *Orissa*, vol. i. (Lond. 1872).

Juggler (akin to Ger. *gaukeln*, 'to move hastily,' and in no way connected with the Lat. *joculator* from *jocus*), an artist in legerdemain or sleight of hand, is the modern representative of the Gr. *thaumatopoios*, the Lat. *præstigiator*, and the *jogelour* of Chaucer and Piers Plowman. Whilst these, however, were all mere acrobats, modern jugglery undoubtedly owes much to the older Magic (q. v.). How close is the connection between the two has been shown in ancient times in the case of Moses and the Egyptian magicians, in our own day by the competition between Robert Houdin and the *marabouts* or priests of Algeria, and still more recently by the rival performances of Messrs Cooke and Maskelyne on the one hand, the Davenport Brothers, Slade, and their like on the other. At any rate, the art of juggling, like magic, certainly originated in the East. From India, too, Western jugglery probably received a fresh impulse by the arrival of the Gypsies (q. v.), who may have introduced many of our modern feats of legerdemain. See Reginald Scot's black-letter *Discoverie of Witchcraft* (Lond. 1584), and the works of W. H. Cremer, published by Chatto & Windus.

Ju'glans and Juglanda'ceæ. See WALNUT.

Jug'ular Vein, one of the large veins on either side of the neck, so named from Lat. *jugulum*, the collar-bone, which 'joins' (*jungere*) the neck and shoulders.

Jugur'tha, king of Numidia, son of Mastanabal, was appointed by his uncle, Micipsa, to a share in the succession with his sons Adherbal and Hiempsal. In 116 B.C. J. caused Hiempsal to be killed; and though Adherbal sought help from the Romans, J. bought them off by bribery, and finally caused his cousin to be put to death in the town of Cirta (112 B.C.). The Romans now made war on J., who with great skill baffled their efforts for a time. At last Q. Cæcilius Metellus, gained a decisive victory at the river Muthul. J. then fled to Bocchus, King of Mauretania, who gave him up to the Romans (106 B.C.). He graced the triumph of Marius as a prisoner in 104 B.C., and thereafter suffered death by starvation. The history of the war against J. is related by Sallust.

Ju'jube, a genus of stiff thorny shrubs or sometimes small trees belonging to the same family as the Buckthorn (q. v.). Their fleshy, berry-like fruit has an agreeable flavour, and when dried forms the jujubes of commerce. Syrup of jujubes is used as a medicine in coughs, fevers, &c. One species is called Jew's thorn because it is said to have supplied the crown of thorns put on our Saviour's head.

Ju'lia, the only child of the Roman Emperor Augustus, born 39 B.C., was the daughter of his second wife Scribonia. She was distinguished for beauty and cultivation of mind, and was first married (25 B.C.) to M. C. Marcellus, her cousin; then (23 B.C.) to M. Agrippa; and finally (12 B.C.)—through the intrigues of Livia, who wished to secure the succession to her son—to Tiberius Nero, afterwards emperor. This marriage lasted till Augustus banished her (A.D. 2) for her licentiousness to the island Pandataria, near Naples. Five years afterwards she was removed to Rhegium, where she died in A.D. 14. Only her daughters Julia and Agrippina (q. v.) survived her; two of her sons, Caius and Lucius Cæsar, died before her, and one, Agrippa, Tiberius put to death.—An elder J. was the daughter of C. Julius Cæsar, and wife of Pompeius, and died 54 B.C.

Ju'lian the Apos'tate (Flavius Claudius Julianus), born at Constantinople, November 17, 332, was a nephew of Constantine the Great (q. v.), whose son and successor, Constantius II., murdered all the male descendants of Constantine Chlorus by his second wife (337), J. and his elder half-brother, Gallus, alone escaping from the butchery. The two brothers received a monkish education in various parts of Asia Minor, till in 351 Gallus was created Cæsar and governor of the East, and on his execution at Milan (354) J. was removed to Italy, and kept for some months in strict captivity. Through the mediation of the Empress Eusebia he was allowed to proceed to Athens (355), there to perfect his study of Greek literature and philosophy, but in the November of the same year was recalled to Milan, and himself proclaimed Cæsar, receiving the Transalpine provinces and the hand of his cousin Helena. His administration in Gaul was vigorous and popular. He defeated 35,000 Alemanni near Strasburg (357), forced the Franks to come to terms of peace, and thrice crossed the Rhine to carry the war into the enemy's country. But these successes revived the smouldering jealousy of his uncle, who in 360 ordered off four of the finest Gallic legions to Persia. Thereupon the troops saluted J. as Augustus, and he, after vain attempts to treat with the Emperor, marched upon Constantinople. Constantius set out from Syria to meet him, but died at Mopsocrene in Cilicia, November 3, 361. For ten years J. had been a Christian in name only; he now openly professed paganism, sacrificed to Jupiter, and strove by his pen and authority to suppress the new religion. Though he published an edict of toleration, he closed the Christian schools, compelled Christians to contribute to the erection of heathen shrines, and sought to falsify the words of Christ by rebuilding the Jewish temple. But this last flash of heathendom was destined to be short-lived. In 363 J. set out from Antioch at the head of 65,000 men on an expedition against the Persians. He crossed the Euphrates and Tigris, but failing to take Ctesiphon, was forced by want of provisions to retreat. In a skirmish he was mortally wounded by a javelin, and died the next night, June 26, 363. Few characters have been more hotly contested than that of J.—exalted by heathen, and debased by Christian writers. Religion apart, he was certainly a sagacious ruler, and even as a pagan he displayed virtues and self-restraint which put to shame many of his so-called Christian successors. The teachings of early instructors (men who had often professed Christianity from purely interested motives), the hypocrisy of Constantius, the mutual persecutions of the orthodox and Arians—all had tended to revolt him from the faith of the Galilean, whilst his vanity was fed by the hopes of reviving the antique glories of his race in its religion, and of winning for himself the proud title of 'philosopher.' Of his writings there are extant eighty-three letters, nine orations, and three epigrams, besides the *Kaisares* and *Antiochikos*, the last a satire on the effeminate inhabitants of Antioch. His most important work, *Kata Christianōn*, is only known to us in fragments. J.'s style is pure, but marred by a servile imitation of classic models, and all his writings are mere echoes of the Neo-Platonists, whose doctrines he so laboured to resuscitate. The best edition of his complete works is Spanheim's (Leips. 1696); of the letters, Heyler's (Mainz, 1828). See the splendid but partial sketch of J.'s career in Gibbon's *Decline and Fall* (ch. xix., xxii., xxiii., xxiv.).

Julian Epoch, in chronology, is the epoch or commencement of the Julian Calendar. See CALENDAR.

Jü'lich (Fr. *Juliers*), formerly a duchy (1600 sq. miles), on the W. bank of the Rhine, is now a part of Rhenish Prussia. It was a countship before its union with Berg (q. v.) in 1348.—J. (Lat. *Juliacum*), once capital of the duchy, on the river Roer, 26 miles W. of Köln, is said to have been founded by Julius Cæsar, has lively trade, and a pop. of 4802.

Julien, Stanislas-Aignan, the foremost Chinese scholar of this century, was born at Orleans, September 20, 1799. In

1821 he became Professor of Greek at the College de France, shortly thereafter he turned his attention to the Chinese language, and displayed so surprising a facility in the mastery of that tongue that in twelve months he could venture to publish a translation of the philosopher Mencius (1824), which immediately made his fame as a sinologue. Besides writing several valuable works on Chinese grammar, J. continued from time to time to give Europe translations from the treasures of Chinese lore, including tales, such as *Yu-Kiao-ei, ou les Deux Cousines* (1863), plays, *Hoei-lan-Ki, ou l'Histoire du Cercle de Craie* (1832), and Chinese technical treatises. The *Vie de Hiouen-Thsang* (1853), the travels of a Buddhist pilgrim, illustrated also J.'s knowledge of Sanskrit. In 1852 he was appointed Professor of Chinese on the death of Rémusat, and in 1855 became president of the college. J. died 14th February 1873.

Ju'lius, the name of three Popes, two of whom are historically conspicuous.—**J. II.** (1503-13), previously Julianus della Novere, a nephew of Sixtus IV., was a warrior, a statesman, and a friend of art and science, and throughout his pontificate strenuously laboured to increase the power of the papal chair. With the Emperor Maximilian I. and the French King Louis XII. he formed (1508) the League of Cambray against Venice, but soon after took part with Venice in the 'Holy League' against France, and drove the French from Italy. Louis caused a Council to be held at Pisa (1511) independent of J.'s authority, but it proved a signal failure, and at the fifth Lateran Council in 1512 the King was excommunicated. He then advanced against J., but was defeated and forced to leave Italy. J. founded the new Church of St. Peter, and died 21st February 1513.—**J. III.** (1550-55), previously Gianmaria de' Medici, was one of the four papal legates who opened the Council of Trent. In 1551 he had again to open the Council, but it was dissolved in 1552 through the interference of the Elector Moritz. J. had a contest with Venice on account of the Inquisition, and endeavoured to unite the Nestorians to the Romish Church. His dissolute life ended 23d March 1555.

Jullundhur' (*Jallandar*), the chief town of the district of the same name, Punjaub, British India, near the right bank of the Sutlej, and a station on the Delhi Railway. Pop. (1868) 45,607. It was once the capital of the Punjaub, and contains many mausoleums of the Lodi-Afghan dynasty. It is now the seat of flourishing silk manufactures, and of trade with the Trans-Himalayan countries. The J. Doab, or tract between the Beas and Sutlej rivers, which was ceded to the British in 1846, is extremely fertile, and is famous for its fruit trees.—The *district* has an area of 1326 sq. miles; pop. (1868) 794,764.

Julus. See Iulus.

July' (Lat. *Julius*), the seventh month of our year, with the Romans was the fifth, the name being changed (45 B.C.) from Quintilis, in honour of Julius Cæsar.

Jumalpore' (*Jamalpur*), a town in the district of Monghyr, Bengal, British India, 721 miles N.W. of Calcutta; pop. (1872) 10,453. It contains the largest iron workshops in India, the property of the East India Railway.

Jumbusir' (Jambusar), a town in the district of Broach, Bombay, British India, near the estuary of the Nerbudda, 212 miles N.W. of Bombay; pop. (1872) 14,924. Exports: cotton, grain, and coarse cloth.

Jumill'ah, a town in the province of Murcia, Spain, on the Jua River, 35 miles N. of Murcia. It has manufactures of ovens and earthenware. Pop. 9613.

Jummu' (Jamu), a town in the native state of Cashmere, India, on the Chenaub, in the lower Himalayas; pop. about 8000. It contains the palace of the Rajah of Cashmere, and is the capital of a tract which formed the earliest possession of the present ruling family. It has manufactures of shawls, &c. The cultivation of the vine and the hop plant have lately been introduced in the neighbourhood. J. was visited by the Prince of Wales in the spring of 1876.

Jum'na (Jamna, named after the goddess *Yamuna*), the chief tributary of the Ganges, rises in Gurhwal, under the Jumnotri peaks, at an elevation of 10,849 feet, not far from the source of the Ganges. It flows first S.W., and, after receiving many mountain torrents, debouches on the plain of Hindustan at Badshahmahal, where the canal system commences. It then turns S.E., and flowing past the towns of Delhi, Muttra, Agra, Calpee, Etawah, &c., joins the Ganges beneath the rocky citadel of Allahabad, after a total course of about 860 miles. At its source are the hot springs of Jumnotri, which have a temperature nearly equal to that of boiling water. At its confluence is the sacred ghaut of Tribeni; its water is here perfectly clear, while that of the Ganges is turbid. Its chief tributaries are the Chumbul, Sind, Betwa, and Cane, on the right bank; and the Hindon and Seengur on the left. It is navigable up to Delhi, where there is a bridge of boats; and it is crossed by the railway near Saharunpore.

The Jumna Canal System is divided into the Western, the Eastern, and the Agra Canals. The Western J. Canal was the first canal undertaken by the British in India, having been commenced in 1823 and completed in 1843. To a great extent it follows the old cuttings of Firoz Shah and Akbar, but great engineering difficulties were overcome. It irrigates 400,000 acres in the Punjaub districts of Kurnal, Delhi, Hissar, and Rohtuck, and supplies Delhi with water; total cost, £311,693; net receipts in 1872-73, £92,500, or 31 per cent. on capital; aggregate length of watercourses, 728 miles. The Eastern J. Canal was commenced shortly afterwards, to water the tract between the J. and the Hindon, and the two now take off from a common head. This also partly follows old works of the Mahomedans. Area irrigated, 200,000 acres; net returns in 1872-73, £30,774, or 16 per cent. on outlay; length of canals and distributaries, 755 miles. The Agra Canal, which has just been completed, will water 350,000 acres in Gurgaon, Muttra, and Agra. The water is diverted just below Delhi by a masonry weir 2428 feet long.

Jump'ing Hare (*Helamys capensis*), or 'Spring haas,' a genus of *Rodentia*, so named from the leaps they are enabled to make by the help of their long hinder limbs. The J. H. inhabits S. Africa. Its colour is a dark or reddish brown, and the tail is very long and provided with stiff hairs.

Junca'ceæ, or **Rush Family**, consists of about 200 species of plants growing chiefly in cold and temperate climates. Their hollow or flat leaves are used for mats and chair-bottoms, and the pith for wicks of candles.

June, the sixth month of our year, was with the Romans the fourth, and was so called either from Juno (comp. Ovid's *Mensis Junonius*), or from the first consul, Junius Brutus.

Jung (*Jang*), a common native name in India, of Persian derivation, signifying 'battle.' Sir J. Behaudur, the late prime minister and 'Mayor of the Palace' to the titular Rajah of Nepal, was born in 1815; he was hereditary ruler of two large estates, and became practical ruler of Nepal in 1845 by means of the unscrupulous removal of all his rivals. In 1850 he visited England, and his favourable reception by the queen, and in London society, determined his policy towards the British, and also towards his own subjects. He assisted Britain during the Mutiny at the head of 16,000 men, who all received the Mutiny medal, while Sir J. himself was created G.C.B., and subsequently K.C.S.I. In 1876 he magnificently entertained the Prince of Wales in the Nepal terai, which affords the best tiger preserves in India. He died suddenly in February 1877, and was peaceably succeeded in authority by his brother.

Jung, Johann Heinrich, called **Stilling**, a German writer, born September 12, 1740, at Im-grund in Nassau, was first a tailor, then studied medicine at Strasburg, where he became a friend of Goethe. He practised medicine at Elberfeld from 1772, and became famous for curing cataract, was made Professor of General Science at Marburg in 1787, returned to Heidelberg in 1804, and died at Karlsruhe, April 2, 1817. J. was a man of simple character and fine feeling. His works are marked by religious mysticism and lively fancy. The chief are *Theobald oder die Schwärmer* (1797), *Theorie der Geisterkunde* (1808), *Scenen aus dem Geisterreiche* (1803). J.'s representations of different periods of his life are collected in 1859 in *Lebensgeschichte J. Stillings*.

Jungermann'ia, a genus to which formerly nearly all the Liverworts with distinct stems and leaves were placed. It is now much restricted, the numerous species having been separated into many genera. See Hepaticæ.

Jung'frau (Ger. 'maiden'), a conspicuous peak of the Bernese Alps, and one of the most beautiful mountains of Switzerland, rises to a height of 13,700 feet, on the N. boundary of Valais. It was first ascended by six peasants in 1828; and then by Agassiz, Forbes, and others in 1841.

Jungipore' (Jangipur), a town in Murshedabad district, Bengal, British India, on the left bank of the Bhagirutti, 130 miles N. of Calcutta. Pop. (1872) 11,361. It is a great mart of river traffic, and also of the silk trade.

Jun'gle-Fowl, a name applied to various kinds of Rasorial or Gallinaceous birds. Of these, the most typical, perhaps, is the Australian J.-F. (*Megapodius tumulus*), an example of the *Megapodinæ*, or 'large-footed' birds, noted for gathering together large quantities of earth to contain its eggs. These mounds act as artificial incubators, and in size may measure 60 feet as to circumference, and 15 feet in height. The J.-F. is brown, and blackish-grey above, the latter tint prevailing on the under parts. The eggs are deposited from the end of August till March. The jungle-fowls of Asia are allied to the ordinary English fowls.

Jun'iper, a name given to several trees or shrubs belonging to the natural order *Coniferæ*. They are evergreens, having their flowers in catkins, narrow awl-shaped leaves, and a berry-like fruit of a bluish colour. The berries (which are really succulent *cones*) take two years to ripen—the name J. (Lat. *juniperus*, 'junior') implying that it *brings forth younger* berries while the others are ripening—and are used to flavour gin. The wood of several species is hard and fragrant, that of *J. Bermudiana*, or Bermudas cedar, being used for pencil-making, cabinets, &c.

Juniper.

The berries yield about one per cent of a mixture of volatile oils, one of which has the composition of oil-of-turpentine ($C_{10}H_{16}$), boils at 160°, and is lævorotatory; the other has the formula ($C_{20}H_{32}$), boils at 205°, and is also lævorotatory. The berries contain nearly one-third of their weight of sugar and wax, resin, acetic, malic, and firmic acids, pectin, albuminous matters, fibre, inorganic matter, and a small quantity of a substance called juniperin is also contained in them. The essential oil is the constituent of chief value.

Medicinal Properties of J.—The oil of J. is stimulant and carminative, but is chiefly used in medicine as a diuretic in debilitated dropsical cases. It is administered in doses of from 1 to 3 minims, and the *spirit*, composed of 1 part of oil and 49 of rectified spirit, in doses of from 30 to 60 minims. J. tar, the French *Huile de Cade*, is used in obstinate skin diseases.

Ju'nius, Letters of, a celebrated series of political tracts which appeared in Woodfall's *Public Advertiser* from January 21, 1769, to January 21, 1772, were fifty-nine in number (including the fifteen by 'Philo-Junius'), and were reissued in a revised and collected form in 1772. To their author have also been ascribed the pre-Junian letters signed 'Poplicola,' the first of which appeared April 28, 1767, as well as some of the minor letters which, under various signatures, supplemented or reinforced the views of 'Junius.' The time of their appearance—the close of the Grafton and rise of the North ministry—was a critical one, with a king bent on asserting his prerogative, a parliament torn by political and private enmities, troubles in America and on the Continent, and at home a rancorous struggle for the liberties of the press. All these topics the *Letters* handled with an energy and sarcasm, a grace of style and happiness of expression, worthy of the most brilliant writers of the period. But their great and lasting interest lay in their personality (Delolme alone, of all the persons mentioned, wholly escaping the writer's lash), in the minute knowledge they displayed of affairs of State and of matters of private history, and above all, in the fact that their authorship remained and still remains a mystery. 'My secret,' said the Unknown, 'shall die with me.' Burke, Wilkes, Tooke, Lyttelton—all these and a dozen other writers were in turn identified with 'Junius,' but none on other than the merest guesswork. The claims of Sir Philip Francis (q. v.), however, first advanced in 1812, were supported by Taylor in his *Junius Identified with a Celebrated Living Character* (1816) by arguments accepted as conclusive by Brougham, De Quincey, and Macaulay. The theory is based on a comparison of handwriting, character, and style, as shown in Francis's acknowledged writings, on his supposed facilities for acquiring the special knowledge displayed throughout the *Letters*, and on his conduct and language respecting them *after* they had been attributed to him. On the other hand, it is on precisely these points that his claims are contested by the 'Anti-Franciscans,' who have the advantage of shifting the *onus probandi* on the upholders of the theory. See Parkes' and Merivale's *Memoirs of Sir Philip Francis* (2 vols. Lond. 1867); Professor F. Brockhaus' *Die Briefe des Junius* (Leips. 1876); and Hayward's *More about Junius* in vol. lxxvi. of *Fraser's Magazine*.

Junk (Dutch *jong*, possibly from Chinese *yong*, 'the sea'), a three-masted, flat-bottomed vessel of from 100 to 300 tons' burden, used by the Chinese, Japanese, and Malays. It has a lofty poop and forecastle, a wooden anchor, lateen sails of matting, and on each side of the bows an eye is painted, as in the ancient Greek trireme. Though extremely clumsy, junks have made voyages to England and America, but they are now being gradually superseded by vessels built on European lines.

Ju'no (originally *Jovino*) the wife of Jupiter, identified with the Greek Hera (q. v.) and Etruscan Cupra, as the patroness of marriage was called *Matrona*, *Pronuba*, and *Jugalis*, and as the goddess of childbirth *Lucina*, identified with the Greek Ilithyia. In early times J. was worshipped at Lanuvium as *Sospita* or 'Saviour.' Her cult was formally introduced at Rome from Veii, but even before this the Romans worshipped her as J. *Regina* or 'Queen of Heaven.' The mint stood close to the temple of J. *Moneta* on the Capitoline. The first of every month was sacred to J., who had a special festival (the *Matronalia*) on the 1st of March. J. is usually represented after the type of Hera.

Ju'not, Andoche, Duc d'Abrantès, a French general, was born October 23, 1771, at Bussy-le-Grand, studied at the College of Châtillon, became aide-de-camp to Napoleon, with whom he went to Egypt (1798) where he was created General of Brigade. In 1805 Napoleon sent him to Portugal as ambassador, but he returned to Paris in 1806, of which he was nominated governor in 1807. Soon after he received the command of an army invading Portugal, and entered Lisbon in triumph. For this last service he was created Duc d'Abrantès. Having failed in the battle of Vimeiro he fell a little in Napoleon's estimation, and in 1812 lost his confidence still further when in command of an army destined to act against Russia. J. was then sent to govern Venice and Illyria, but during a fever cast himself from a window, and died at his father's house at Montbard near Dijon, 22d July 1813. See Mme. d'Abrantès' *Memoires* (Par. 1831-35).

Jun'ta (Span. an 'union'), a term applied in Spain to an assembly called together or meeting voluntarily for a political object. Juntas have from 1808 up to recent times played an important part in Spanish history, having several times placed themselves at the head of political movements, and undertaken the direction of affairs.

Jupati' Palm, found in the coast region of the Amazon valley, has a stem 6 or 8 feet high, but its gigantic spiny leaves, 40 to 50 feet long, and erect, being supported on leaf-stalks 12 feet long, give the plant the appearance of being from 60 to 70 feet high. The leaf-stalks are used for walls of houses, &c., and their pith is used as cork. It is the only scaly-fruited palm of America that has pinnate leaves, all the others having fan-shaped leaves.

Ju'piter (contracted from *Diovis pater*, or *Diespiter*, the 'heavenly father'), identified with the Etruscan Tina or Tinia and the Greek Zeus, was the supreme deity of the Romans, and received worship on the Capitoline as *Optimus*, *Maximus*, *Capi-*

tolinus, and *Tarpeius*. As lord of the heavens, he was called *Pluvius*, *Tonans*, *Fulgurator*, *Lucetius*, &c. J. was the tutelar deity of Rome, and had many surnames from attributes of power and success in war. A great festival of J., called the *Feriæ Latinæ*, held yearly on the Alban Mount, was said to have been instituted in honour of the union of Rome and the states of Latium, and a sacred feast named the *Epulum Jovis* fell on the 13th November. The care of his worship belonged to the *Flamen Dialis*, who held the highest rank among priests. Representations of J. follow the type of the Greek Zeus (q. v.).

Jupiter is the largest planet of our solar system. Its mean distance from the sun is 478,000,000 of miles; its period of revolution or year 4,332·585 mean solar days; the excentricity of orbit ·04816; the inclination of the plane of its motion to the ecliptic 1° 18′ 30″; its diameter about 85,000 miles; and the period of its rotation round its axis only 9 hours, 55 minutes, 26 seconds. A direct effect of this rapid rotation is the evident oblateness of the planet's disk, the compression at the poles being as much as $\frac{1}{17}$ of the equatorial diameter. Its density is about one-fourth that of the earth, while its *mass* has been estimated by Airy, Bessel, Von Asten and others, from observations of the elongation of a satellite, or from the measured perturbations upon comets and asteroids, to be between $\frac{1}{1047}$ and $\frac{1}{1048}$ of the sun's mass. When viewed through a telescope, the surface of J. presents a streaked appearance, which Sir John Herschel has explained as probably due to trade-winds acting upon the cloud masses in the planet's atmosphere. Subsequent study of the surface, however, has led some authorities to take up the view that J. in its physical condition bears little resemblance to our earth, but is in reality a molten mass in a state of great activity, throwing out on all sides masses of semi-transparent vapour. It is this vapour we see, and not the planet's true body, which is hid from us just as the true nucleus of the sun is hid behind the glowing chromosphere. J. has four satellites, which were first discovered by Galileo (q. v.). They suffer eclipse exactly as our moon does. The eclipses are announced in the *Nautical Almanac*, and may be used for determining longitude. They are also of historic interest, since it was by observations of them that Römer was led to the determination of the velocity of Light (q. v.). See SOLAR SYSTEM.

Ju'ra, a mountain range extending in a north-easterly direction for a distance of 450 miles from the river Rhone to the Fichtelgebirge in Central Germany, where the Main has its source. It is divided by the Rhine into two portions, known as the Swiss and German J. respectively. The former lies chiefly in France, and gives name to a French department. It consists of a number of parallel ridges separated by narrow and deep valleys, through which small streams flow S. to the Rhone. The principal heights are Col de la Neige (5342 feet), Reculet (5330), Mont Credoz (5250), Grand Colombier (5230), Mont Tendre (5212), and La Montagne de Dôle (5210). The German J. presents a wholly different aspect, being rather a succession of plateaux of moderate height with few intersecting streams. It looks S.E. over the basin of the Danube. The heights are insignificant, the highest being Oberhohenberg (3300 feet). Geologically, the J. consists of a characteristic limestone, which is contemporaneous with our oolites.

Ju'ra, a department of France, on the Swiss frontier, traversed from N. to S. Area, 1924 sq. miles; pop. (1872) 287,634. It is watered by the Ain, Bienne, Doubs, Loue, and Seille. The mountains are clad with pine forests and fine pasture, and the valleys and plains yield abundance of grain and wine, to the extent yearly of 505,000 hectolitres, and to the value of 5,000,000 francs. A notable product is the yellow wine of Château-Chalons, known as the *Madère Français*. The mining and working of iron is a leading industry. J. is traversed by several lines of railway. Lons-le-Saubnier is the capital, and other towns are Dôle, Sainte Claude, Arbois, and Poligny.

Jura (Scand. *deor-oe*, 'deer island'), the fourth largest island of the Inner Hebrides, is separated from the mainland of Argyleshire by the Sound of J., 10 miles broad, and from Islay (q. v.) in the S.E. by a long channel that narrows to half a mile. It is 27 miles long and from 5 to 7 broad, and is bleak and mountainous, rising to a height of 2560 feet in the Paps of J., three round-topped summits. The W. coast, which is wild and rocky, is indented by the narrow Loch Tarbet to a depth of 4 miles. A belt of plain stretching along the E. coast yields some oats, barley, flax, and potatoes, and is dotted with a few fishing villages. Red deer and other game abound, and there is a considerable export of black cattle. Pop. (1871) 761. Between J. and the island of Scarba in the N. is the whirlpool of Corryvrechan (q. v.).

Jurass'ic Series. See OOLITIC SERIES.

Jurisdic'tion in law means the legal authority of Court or judge. Objection to J. is in England called a plea to the J. The same in Scotland is included in what are called *preliminary* pleas. See CONFLICT OF LAWS, INTERNATIONAL LAW.

Jurispru'dence is the term used to denote the science or philosophy of Law (q. v.), or an exposition of the principles on which positive law is based. See Austin's *Province of J. Determined*.

Jury, Grand. See GRAND JURY

Jury, Trial by. This mode of legal trial has existed in England from immemorial time. By 6 Geo. IV. c. 50 several abuses which had crept into the system were removed. According to the Jury Act the church wardens and overseers of the poor are required to make out an alphabetical list before the 1st September each year of all men in their respective parishes qualified to serve on juries. The summons of every common juror must be at least ten days, and of every special juror at least three days before he has to attend; but in the City of London, and in the county of Middlesex six days are allowed between summons and appearance. Judges may direct the sheriff to summon 144 jurors, but not more, to attend the assizes on their respective circuits, to serve indiscriminately on civil and criminal trials. These are to be divided into two sets, one of which is to attend at the beginning, the other, at the end, of the assizes. On the jurors' names being called they may be objected to, or *challenged*, as it is called, as improper persons to form a jury. Challenge to the *array* is an objection to the whole list, or *panel*, of jurors. Challenge to the *poll* is an objection to an individual. A *special* jury is one in which jurors are selected from the better educated classes, to try a cause involving a question of more than ordinary difficulty. If after a jury have retired to consider their verdict they have meat, drink, fire, or candle without consent of the Court, and before finding their verdict, they are liable to be fined. If any juryman speaks to either party to a suit, or to his agent after retiring, or if the jury cast lots for whom they shall find, the verdict will be set aside. No new evidence can be adduced after the jury have retired. They may have a witness recalled to repeat his evidence in *open* court, but not privately. When a criminal trial cannot be finished in one day, the Court may adjourn till next morning, but the jury must be kept so as to have no communication except with each other. In trials for misdemeanour the jurors may be allowed to go home on engaging not to allow themselves to be spoken to on the subject of the trial. In civil cases the jury may separate until the judge has summed up, after which they cannot do so. In England a jury must be unanimous in its finding. If they cannot agree after having been in deliberation for a reasonable length of time they are discharged. A new jury may then be summoned and the process repeated. In civil cases if there has been any mistake on the part of the judge, or any misconduct on the part of the jury, the losing party will be allowed a new trial. But in a criminal case under the same circumstances no new trial will be allowed, either in England or in Scotland. In the latter country T. by J. in civil cases was introduced according to the English practice in 1815; but unanimity is not required in returning the Verdict (q. v.). See also GUILTY, GRAND JURY, JUDGMENT, CIVIL.

Jury-mast (probably contracted from *injury-mast*), a temporary mast in a ship.

Jus Devolu'tum, a phrase used in Scotch ecclesiastical law to denote the right which devolves upon a presbytery to appoint a minister to a vacant charge, if the congregation fail to do so within six months.

Jus Gen'tium. See INTERNATIONAL LAW.

Jushpore' (*Jashpur*), a native state in Chota Nagpur, India, in political connection with the Bengal Government. Area, 1947

sq. miles; pop. (1872) 66,926; revenue about £2000; tribute £77, 10s., paid through the neighbouring chief of Sargujah. The chief place is Jushporenuggur, or Jugdispore. The staple crop is rice; gold is found by washing in the river Id.

Jus Mari'ti, a term of Roman law and of Scotch law, denoting the right which a husband acquires by marriage over his wife's property. See under CONTRACT—*Contract of Marriage.*

Jus Relic'tæ, a term of Scotch law, denoting the share of the *Goods in Communion* (q. v.) to which a wife is entitled on the death of her husband.

Jus Representatio'nis, a term adopted by the Scotch law from the Roman, to denote the rule of law by which the descendant of an elder brother takes the place of his father in succeeding to heritage before the younger brothers of his father. Formerly there was no J. R. regarding movable property; but this was changed by 18 Vict. c. 23, so that the issue of a predeceasing next of kin take the place of their parent in intestate succession. See SUCCESSION, EXECUTORS, INTESTACY.

Jussieu, Antoine de, the earliest of the famous botanists of this name, was born at Lyon, 22d April 1686, became Professor of Botany at the Jardin du Roi in 1708, and died at Paris, April 12, 1758. He was a most indefatigable working botanist, travelled through various foreign countries collecting plants, and wrote several works on his favourite science. He was ably assisted by his brother, **Bernard de J.**, who was born at Lyon in 1699, accompanied Antoine in his various travels, became demonstrator at the Jardin du Roi in 1722, and died at Paris, November 6, 1777. As superintendent of the botanical garden at Trianon, he arranged the plants according to a system which was afterwards elaborated by his nephew.—**Antoine Laurent de J.**, son of Antoine, was born at Lyon, April 12, 1748. He was carefully trained in botanical science by his uncle Bernard, whose method of classification he adopted and developed. As Professor of Botany in the Jardin du Roi, he had peculiar opportunities for establishing the new system, which, on the completion of his *Genera Plantarum* (1778–89), at once superseded the convenient, but evidently artificial, classification of Linnæus. (See BOTANY.) In 1790 he organised, with the aid of Daubenton, Lemonnier, and others, the Museum of Natural History, became in 1804 Professor of Botany in the University of Paris, and died September 17, 1836.—**Adrien de J.**, son of the preceding, was born at Paris, December 23, 1797, and passed his whole life at the Museum of Natural History, where he succeeded his father as Professor of Botany in 1826. He died June 29, 1853. He was the author of numerous and important memoirs on various natural orders, and wrote besides a work entitled *Cours Élémentaire de Botanique* (Par. 1848), which was translated into nearly every European language, and was for long the standard treatise on the subject.

Jus'tice may be considered as a moral habit of the mind, or objectively as a course of conduct in certain circumstances. In the first sense it is described by psychologists as the cardinal social virtue; in the second it is treated of by moralists and lawyers as criminal J., civil J., abstract J. But the meaning of the word is extremely vague. It is said to be just that crimes should be punished: that contracts should be enforced: that the infirm poor should be supported: that society should frown on certain vices: that the laws should treat all classes in the same manner: that persons who have received benefits should feel grateful. Even the operations of nature have been described as just, but this generally with reference to some human duty of prevision or precaution. There is almost always some reference to the interests of others than the actor, but it is sometimes said that a man is unjust to himself (as through intemperance, overwork, &c.), and, in fact, J. has been applied to the conditions of well-being, to the right balance and harmony of forces, to the adaptation of organism to environment in the individual and in society. On the other hand, teachers of natural law distinguish between J. and charity: between duties of perfect obligation which imply co-relative rights to demand performance, and duties of imperfect obligation which are binding only on conscience. This distinction cannot be maintained on grounds of natural law; for either a man is entitled to nothing but what positive law gives him, or every member of society is entitled to demand that all the other members shall live a perfectly virtuous life. The word J. comes from the Latin *jussum*, 'what has been ordered;' and the Greek δίκαιον from δίκη, 'a suit-at-law,' δίκη first meaning the manner of doing things, then the prescribed manner. The root idea is therefore conformity to law, either existing or which ought to exist. Penal sanction is common to J. and to moral obligation. But J. seems to be distinguished by the presence of a desire to punish or to reward a definite object. This springs from personal resentment for injury and the instinct of self-defence, which feelings are extended to the case of others being injured (at first only within the family, caste, tribe, or clan), or to ideal cases. Such is the origin of the peculiar force of the sentiment of J., but the sentiment does not become strictly moral until it is subordinated to the social sympathies. J. is violated equally by wrongful aggression and by the wrongful withholding of rights; hence the sacred shibboleth of liberty, equality, fraternity. Expediency may demand what is inconsistent with abstract J., but the history of human freedom is the gradual recognition of social inequalities as inexpedient and therefore unjust. There are many classical discussions of J.: as in Plato's *Republic* (where it is put for the health of the state); Aristotle's Eudemian Books, where the Pythagorean idea of J. as retaliation is discarded for the famous distinction of distributive J. according to merit fixed by the state constitution, and corrective or reparative J.; among the Stoics, who, in order to make the individual independent, minimised his responsibility for others; among the Epicureans, who based J. on the feeling of reciprocity or joint interest; the school of Hobbes and Hume, which, on the assumption that for the sake of peace primitive society has surrendered a portion of its unlimited rights of enjoyment, resolves J. into the respect of property and the performance of covenants; the intellectual intuition school of Clarke and Wollaston, who identify injustice with falsehood or contradiction. We may also mention the maxim of Kant, 'Act as if the maxim of your action ought by your will to become the universal law of nature;' and the definition of Herbert Spencer as 'the mutual limitations of man's actions necessitated by their co-existence as units of society; limitations the perfect observance of which constitutes that state of equilibrium forming the goal of political progress.' This is merely a biological way of putting the golden rule of Christianity, which merges the distinction of social and personal duty in the higher conception of 'living to God.'

Jus'tice, College of. See COLLEGE OF JUSTICE.

Justice, Lord Chief. The principal judge of the Queen's Bench division is entitled L. C.-J. of England. There is also a L. C.-J. of the Common Pleas division.

Justice Courts. See JUSTICE, LORD-CHIEF.

Justices of the Peace. The Lord Chancellor, the Lord Treasurer, and all the Justices of the Queen's Bench are *ex officio* conservators of the peace. J. of the P. for the county are usually appointed on the recommendation of the Lord-Lieutenant. Their powers and duties depend on their commission. These powers are generally to suppress riots, and otherwise to preserve the peace, and to commit for trial those accused of crime. Their duties have been greatly increased by late Acts of Parliament, as regards the regulation of gaols and houses of correction, in taking cognisance of various offences against the vagrant, game, and revenue laws, and in the licensing of public houses. By statute, every Justice of the Peace must have an estate of £100 per annum, clear of incumbrance, or the immediate reversion of reserved rents to the amount of £300, and if he acts without qualification he forfeits £100. 34 and 35 Vict. c. 18 repeals the law disqualifying attorneys and other lawyers in practice from being J. of the P. for counties; retaining the disqualification, however, as regards the counties in which they carry on their profession. A Justice of the Peace acts *ministerially* or *judicially*—*ministerially* in preserving the peace, hearing charges against offenders, issuing summonses or warrants, bailing the supposed offender or committing him for trial—*judicially* when he convicts for an offence. His conviction drawn in due form is conclusive. If a Justice of the Peace act illegally, maliciously, or corruptly, he is punishable by information or indictment. When a criminal information is applied for against a magistrate, the question for the Court is not whether the Act founded on was right, but whether or not it proceeded from an unjust, oppressive, or corrupt motive.

In Scotland an endeavour was made to introduce the office of Justice of the Peace by the Act 1587 c. 82, but it required repeated enactments to lay the foundation of the system, which was not fully done till the passing of the Act 1661 c. 38. By the Articles of Union the laws for regulating the trade, customs, and excise in Scotland are assimilated to those of England; and accordingly J. of the P., in Scotland, are vested with the same powers as they have in England, in matters which affect the customs and excise; and by the statute 6 Anne c. 6, the same powers were given to J. of the P. in Scotland, which had formerly been held by J. of the P. in England in relation to the preservation of the peace; leaving the trials and judgments to be regulated by Scotch forms and customs. In England some of the more eminent of the Justices form what is called a *quorum*, without whose presence certain business cannot be transacted. This arrangement has never been introduced into Scotland, where no particular qualification of rank or property is essential.

Justice-Clerk, Lord, a judicial officer in Scotland second in rank to the Lord Justice-General, in whose absence he presides in the Court of Justiciary. Usually the L. J.-C. presides over the Second Division of the Court of Session.

Justice-General, Lord, is the highest judge of the Court of Session in Scotland. He is also called the Lord President of the Court of Session.

Justices, Lords, were officials appointed by the sovereign, on leaving the kingdom, to carry on certain of the regal functions; for example, the summoning or prorogation of Parliament, and the disposal of church preferment in the gift of the crown. The last appointment of L. J. was by George IV. on visiting Hanover. Queen Victoria has never delegated her authority on leaving the kingdom; the highest legal authorities being of opinion that it is unnecessary to do so.

Justices' Clerk is in England an officer appointed by the Justices of the Peace to advise them in their legal administration. The appointment, which is paid by fees, is usually given to a solicitor of good local position.

Justi'ciary Court. The supreme criminal court of Scotland is so called. Its jurisdiction extends over the country, and over all crimes. It is an appellate court as regards inferior criminal tribunals, its decisions being final. It usually sits in Edinburgh, but it holds circuit courts, for which purpose the kingdom is divided into three divisions, the South, the West, and the North. A circuit court is held thrice a year in Glasgow.

Jus'tifiable Hom'icide. See HOMICIDE.

Justifica'tion, in Pauline theology, is the declaration of God by which remission of his sins is granted to the sinner in view of his faith. Properly the only possible way in which this could have been accomplished was by the sinner suffering death. But it became possible for him to be justified without actually suffering death through the conjunction of three things equally indispensable—the grace of God, the blood of Christ, and the faith of man. (1) First of all Christ died; (2) the sinner by faith may be so joined to Christ, become so essentially one with him, that in his death the old man dies, so as to rise in Christ's resurrection as a new man; and (3) God in his grace is willing to substitute this mystical death (*of the sinner*) in Christ for real death, and so he who dies thus is justified (Rom. vi. 2–11; Gal. ii. 20; 2 Cor. v. 14, 'then all died').

After the Reformation, the Roman Catholic doctrine, which of course did not originate then, was that J. and Sanctification constituted the one act of *making just*. The Protestant doctrine was that J. is a forensic act performed by God, antecedent to the work of Sanctification. Roman Catholics also differed from Protestants in holding that good works are a necessary condition of salvation *in addition* to faith.

Jus'tin, a Roman historian, not later than the 4th or 5th c. A.D., author of *Historiarum Philippicarum Libri XLIV.*, still extant, taken from the lost *Historiæ Philippicæ* of Trogus Pompeius, a contemporary of Augustus. The *editio princeps* of J. was printed at Venice by Jenson in 1470. Frotscher's edition (in 3 vols. Leips. 1827) is the most useful.

Justin I. *the Elder*, Eastern Roman Emperor, was born in the hamlet of Tauresium (450 A.D.) in Dardania. Originally a Slav or Gothic shepherd, he went to Constantinople to seek his fortune. Being enrolled in the guards he made himself famous for courage in the wars with Persia, and rose from tribune to senator and commander-in-chief. On the death of Anastasius I. in 518 he was proclaimed emperor, though he could neither read nor write. J. left the administration of affairs to Proclus, allied himself with the adherents of the Orthodox Church, and (520) adopted his nephew Justinian (q. v.). A war with the King of Persia, the occurrence at Antioch of a disastrous earthquake, and the measures he adopted for making good its ravages, are the chief events of his later career. He died August 1, 527.—**J. II.** *the Younger*, nephew of Justinian, ruled from 565 to 574, when he became insane. He died 26th September 578. In his reign the Lombards wrested Italy from the empire.

Justin'ian I. (**Flavius Anicius Justinianus**; Slav. *upravda*, 'upright,' of which Justin and Justinian are supposed to be Latin translations), was born at Tauresium, the modern Kustendje (q. v.), 11th May 483. He was educated at Constantinople, and following the fortunes of his uncle, Justin I. (q. v.), was by him appointed commander-in-chief of the Asiatic armies (520), consul (521), and co-emperor (527). Justin dying in the August of the same year, J. was crowned head of the Eastern Roman empire, with Theodora for his colleague, the actress and courtesan whom he had wedded in 525, and who exercised so baneful an influence upon his reign. She it was who urged J. to his vain attempt to coerce the Monophysites into orthodoxy, and her partiality towards the 'Blues' led to the terrible faction fight of the Hippodrome (532), in which 30,000 persons lost their lives. The external history of J.'s reign is that of the conquests of his generals, Belisarius (q. v.) and Narses (q. v.), which for a time partially reunited Italy to the empire, but diverted men's minds from the growing assaults of Persia and the other nations of the East, from whence the final ruin was to come. These wars, too, so drained the imperial treasuries that taxes heavy and unequal fell on J.'s own immediate subjects like a hailstorm. At home the Emperor abolished the consulship, and closed the Neo-Platonic schools of Athens and Alexandria. He built twenty-six churches in Constantinople, that of St. Sophia among the number, and lavished £200,000 on the embellishment of Antioch, while the enormous expenditure entailed by his fortifications in Thrace and Asia was barely compensated by the introduction into Europe of the silkworm by Nestorian missionaries returned from China. J. died November 14, 565, leaving to his nephew, Justin II. (q. v.), an empire vast but unwieldy, outwardly imposing but rotten at the core. His character presents a strange medley of virtues and vices, for, whilst frugal, kindly, and of exemplary private life, he was vain, jealous, and rapacious, and his ingratitude to Belisarius is an eternal infamy. He has left at least one lasting monument to his genius in the *Corpus Juris Civilis*, comprising the code, digests or pandects, institutes, and novells. These, executed under his directions by Tribonian (q. v.), first shaped the Roman law into a definite code, and have formed the groundwork of the civil law of most civilised nations. See Gibbon's *Decline and Fall*.

Justin Martyr, a Christian apologist, was born at Neapolis (anc. Shechem, mod. Nablus), in Samaria, somewhere between the years 89 and 118 A.D. His father was a heathen, and he himself was by turns a Stoic, Peripatetic, and Platonist, till meeting one day with a meek and venerable old man on a lonely spot by the sea-shore, he was led by his discourse, first to a study of the Hebrew prophets, and thence to a profession of the Christian faith (119–40). J. did not, however, discard his old pursuits. He rather saw in Christianity the highest of all philosophies, gathering in its focus the rays of truth that had been scattered throughout the various heathen systems. As such he commended it to Antoninus 'the Philosopher,' and as such he defended it from the assaults of learned Jews. He is said to have suffered martyrdom, on occasion of a second visit to Rome, about the year 165. Of the writings assigned to J. three are undoubtedly his work, the first and second *Apologia pro Christianis*, and the *Cum Tryphone Judæo Dialogus*; four are of questionable authenticity, and five are certainly spurious. Eight others are either wholly lost, or exist only in fragments. The *editio princeps* was published by Stephanus (Par. 1551), and the best and most recent edition is that of Otto (3 vols. Jena, 1842–46). There is an English translation of J.'s works in the *Ante-Nicene Library*

(Edinb. 1867). See Semisch, *Justinus der Märtyrer* (2 vols. Bresl. 1840-42).

Just Intona'tion, in music, is tuning related notes to their true relative pitch. See TEMPERAMENT.

Jute is the textile fibre obtained from the stalks of *Corchorus capsularis* and *C. olitorius*, two closely-allied plants belonging to the natural order *Tiliaceæ*, natives of and cultivated throughout the greater part of Bengal. The two plants are precisely similar in external appearance, leaves, and flowers, the only points of difference being the greater height to which *C. capsularis* attains—5 to 10 feet as against 5 to 6—and the form of the seed capsule, which in *C. capsularis* is wrinkled and globose, while in the other it forms a long slender cylinder. There are various other species of *Corchorus* growing in *Bengal*, but these alone are the sources of J. The term J. is the Anglicised form of the Orissa name *jhat*, derived from the ancient Sanskrit *jhat*; the Bengalee name is *pat* or *kosha*.

The plant has been cultivated and its fibre used in Bengal from time immemorial, where also its fresh green leaves have been, and still are, employed as a pot-herb; but it is only in very recent times that its fibre has attained the position of an important article of export. In the year 1793, 100 tons of the fibre was sent to England by the officers of the East Indian Company, under its native name of *pat*. It was very favourably reported on as being 'not hemp, but a species of flax superior in quality to any known in the trade, 1000 tons of which,' says the report, 'would readily go off annually at from £40 to £60 per ton.' Two years later Dr. Roxburgh prepared and sent to England a bale of the fibre under the name of J., which he learned from the Orissa gardeners; and this constitutes the first time the English term was applied to the fibre. From that date a small fluctuating export trade sprang up, but it was not reckoned sufficiently important to merit a special heading in the Calcutta Custom House records till the year 1828-29. In that year 364 cwts. were exported, and thereafter the exports grew with extraordinary rapidity till in 1872-73, not less than 7,250,000 cwt. were shipped from Calcutta, valued at nearly £4,000,000 sterling; and into Great Britain alone in 1874 the quantity imported was 4,270,164 cwts. At the same time the local manufacture has also developed with great rapidity. About fifteen mills with English machinery and controlled by English capitalists are now working in the neighbourhood of Calcutta. Fifty million Gunny Bags (q. v.) are annually exported, to the value of more than £1,000,000. The native Indian manufacture is chiefly confined to gunny bags, gunny cloth, twine, and coarse paper.

For the cultivation of the J. plant, a rich alluvial soil, a hot, moist climate, and an abundant rainfall appear to be most favourable. The seed is sown broadcast from the latter half of March till June, and reaped from August to October in different localities. The cultivation is chiefly confined to the lower valley of the Brahmaputra, where the Mahommedan population is in the majority. Its rapid extension is due to the enterprise of the petty farmers, stimulated by the commercial demand; and it has greatly added to the prosperity of this class, who rely upon it for paying their rent. The fibre is separated from the woody stalk by a process of steeping, similar to that practised with flax and hemp. When separated it is washed in water, dried in the sun, and made up into hanks, which are collected by retail dealers for despatch to the markets of Serajgunge, Naraingunge, &c. It is pressed into bales, for exportation, at Calcutta in screw presses, the bales weighing 300, 350, or 400 lbs. About seven million cwts. are annually received in that city by native boat, steamer, and rail, of which two million cwts. are consumed locally.

The fibre of J. is long, smooth, and glossy; and it possesses a brownish yellow tint, which can only be discharged with great difficulty by bleaching. On this account it has not yet been successfully employed as a white paper-making material, although on several occasions the *Dundee Advertiser* has been printed on a very fair paper made from pure J. The fibre takes brilliant dye colours readily, but they are all comparatively fugitive. One of the most remarkable properties of J. is the facility with which it can be prepared to imitate other and more valuable articles, as wool, silk, and even human hair. On this account it is much used for inferior classes of carpeting, for adulterating or imitating silk textures, and for making stage wigs, tresses, and ladies' hair pads. The staple manufacture, however, consists of 'hessians,' a coarse fabric for packing, sackings, Osnaburgs, mattings, ducks, and other heavy cloths. The process employed in preparing, spinning, and weaving J. are essentially the same as those used for flax, but the machinery is heavier.

The great seat of the J. manufacture is Dundee in Scotland. There the fibre became an important staple during the Crimean war (1853-55); and the outbreak of the American civil war, with the consequent cotton famine, gave the trade an enormous impetus. In 1838 only 1136 tons were consumed by Dundee manufacturers, in 1847 the consumption had risen to 6966 tons; in 1854 it was 16,590, and in 1872, the year of its greatest prosperity, the trade demand was 96,000 tons. To a limited extent the manufacture is prosecuted in Glasgow and at Barrow-in-Furness, besides various Continental and American localities. See *Report of the J. Commission* (1 vol. fol. Calc. 1874).

Jü'terbogk (named after the Slavic god of spring), a town in the province of Brandenburg, Prussia, 28 miles S. of Potsdam, on the Nuthe, an affluent of the Havel, with woollen manufactures and a pop. (1875) of 6852. Near J. is the battlefield of Dennewitz (q. v.).

Jut'land. See DENMARK.

Juvena'lis, Decimus Junius, the most earnest and trenchant of Roman satirists, was born at Aquinum, an inconsiderable town of the Volsci. The year of his birth is unknown. Dodwell, an inexact authority, sets it down as 38 A.D. Teuffel, with greater caution and with some regard to historical fitness, gives the period of J. as 47-130 A.D. Mr. Walford (see *Juvenal* in Blackwood's *Ancient Classics for English Readers*) dismisses this interesting question with the words, 'The dates of his birth and of his death are alike disputed.' 'That the only facts with regard to Juvenal on which we can implicitly rely are that he flourished towards the close of the 1st. c., that Aquinum was, if not the place of his nativity, at least his chosen residence, and that he is in all probability the friend whom Martial addresses in three epigrams.' From his boyhood till he attained the age of thirty-five nothing is known of him save that he devoted himself to the study of eloquence, according to the practice of the time, more for his own amusement than for gain or professional advancement. Satire—the sphere in which the genius of Juvenal worked—was a purely Roman growth. It began with Lucilius, and was continued by the witty, delicate, graceful Horace. To him succeeded J., in every respect distinct, earnest, strong, intensely human, with a depth of sentiment, a real sorrow, and a despairing earnestness, new in the literature of the world, if we except a few passages in the Hebrew Scriptures. His satires, sixteen in number, cover a wide field. Their onslaughts on tyranny, corruption in morals and policy, silly vices, and vagrant fancies have a perennial vitality. J. was the Hogarth of his time. Though much better known to the English public than many of the *dii majores* of Latin literature, he is still very imperfectly appreciated. Dryden's version of five of his satires are at best but fair. Dr. Johnson's *London* and *Vanity of Human Wishes* are vigorous imitations of two of the most notable. Gifford's version is on the whole terse, pungent, and scholarly; but a really good translation of J. has still to be executed. The *editio princeps* of J. was published at Venice, 1470, folio. The editions of Ruperti (2 vols. Leips. 1801); Lemain (2 vols. Par. 1823); Jahn (Berl. 1851); and J. E. B. Mayor (with commentary, Lond. 1869), may be noted as works deserving the attention of scholars. Continental translations are numerous. That of Hertzberg and W. W. Teuffel (Stuttg. 1864-67) is distinguished by singular felicity of diction, force, and character. With all their epigrammatic turn and satiric power the French have failed in giving us a good translation of J.

Ju'venile Offen'ders. To avoid the evils of the long imprisonment of the J. O. before trial, 10 and 11 Vict. c. 82, enacts that persons not exceeding fourteen years of age, accused of simple larceny or of aiding in its commission, may be summarily convicted by two justices, and sentenced to imprisonment for a period not exceeding three calendar months, with or without hard labour, or to forfeit a sum not exceeding £3; and if the offender be a male he may be once whipped in addition to the other punishment, or instead of it. If either the accused or their parents object to a summary conviction, justices are to proceed as before the passing of the Act, which is extended by 13 and 14 Vict. c. 37, and by 25 Vict. c. 18. The Acts apply to Scotland.

K.

the eleventh letter in the English alphabet, corresponding to the *kappa* of the Greeks and the *kaph* of the Semitic languages. It is the sharp mute of the guttural series, its pronunciation being identical with that of the hard *c*. In fact, this sound does not require two separate letters. In Greek there was no *c* at all, as is also the case in many Oriental languages; whereas in Latin the use of *k* was ultimately confined to some two or three exceptional words—Kalendae, Kaeso, and Karthago. The Romance languages, following the Latin, only use *k* in words of foreign derivation. The Germans, on the other hand, use *k* exclusively, while the English alphabet, as in so many other cases, occupies an intermediate position. *K* is used by us in native words as an initial chiefly before *e*, *i*, and *n*, and as in German, to strengthen *c* when terminating a monosyllable, as *luck*. Modern usage drops the final *k* in such Greek derivatives as *music*. The Semitic *kaph* is to be distinguished carefully from *koph*, which latter has been borrowed in the form of *q*. For the interchanges of *k* compare Carolus, Charles, Karl; and 'knee,' Lat. *genu*. See also *C* and *G*. As an abbreviation, *K*. stands for knight, as in K.C.B. = Knight Commander of the Bath.

Ka'aba (Arab. 'square house'), a rectangular building, 38 feet high and 28 feet broad, in the mosque at Mecca, said to have been built by Abraham for the worship of the One God, into the S. corner of which is fixed the large stone called *Hadschar-el-Aswad*, given to Abraham by the angel Gabriel, once pure white, but now black with the kisses of penitents, or, as others say, with its own tears for men's sins. Frequent repairs, especially those of the Sultan Mustapha in 1630, have left only a small portion of the original building. Instead of Jerusalem, Mohammed made the K. the *Kiblah*, *i.e.*, the object in the direction of which worshippers must turn in praying, and ordered pilgrimages to be made to it. It was an Arab place of worship even before Mohammed, who destroyed the 365 idols that surrounded it. The K. receives annually a new outer covering of black silk, embroidered in gold with verses of the Koran, and round it are many porches and other places of devotion, as well as the well of Zem-Zem, where pilgrims wash. The whole is enclosed by a great covered passage, and is called *Medschid-el-Haram* ('holy mosque').

Kaama. See HARTEBEEST.

Kab'yles (properly *K'baïl*, 'confederates,' the plural of the Arabic *K'bila*, 'a league'), the name of the Berbers of Algeria and Tunis. The K. are one of the chief indigenous peoples of N.W. Africa, distinct from the Æthiopic or black population, and unquestionably of the same stock as the nations of antiquity known as Mauretanians, Numidians, Getulians, &c. They are brave but vindictive, of ordinary stature, well-built and handsome, with complexions ranging from dark-brown to a dirty yellow, with straight hair, scant beards, and black eyes. The pop. of Algeria was 2,448,691 in 1875, and of this number it was estimated that one-third were K. See ALGERIA and BERBERS.

Kadur', a town, but since 1865 not the chief town, of the district of the same name in the state of Mysore, India, 145 miles N.W. of Bangalore. Pop. (1871) 2733.—The *district* of K. has an area of 2294 sq. miles; pop. (1871) 333,925. Coffee cultivation in S. India originated here. Berries were brought from Mecca two centuries ago, and Europeans commenced planting about 1835. There are now 13,000 gardens, covering 60,000 acres.

Kaff'a (so called by the Genoese, from the Tartar *Kefé*), or **Feodo'sia**, a fortified port of Russia, in the Crimea, on a bay of the same name, an inlet of the Black Sea, 55 miles W.S.W. of Kertch. It was the chief seat of the Genoese trade in the 13th c., and when it fell to the Turks it was called 'Little Stambul,' and had 100,000 inhabitants, 51 mosques, and 171 springs. It was the residence of the Tartar Khans from 1774 till its conquest by the Russians in 1783. The higher part of the town contains the Tartar citadel and barracks. K. is the entrepôt of a large caravan trade, and has great magazines. Its exports, chiefly wheat, hides, and goat's hair, amounted to 817,474 roubles in 1873. Pop. 8482.

Kaffaristan' (Arab. *Kafir*, 'unbeliever,' and the Pers. word *istân*, 'place or abode'), a region of Afghanistan, on the southern slopes of the Hindu Kush, which has never been visited by Europeans. It is inhabited by a race called Kaffar Siahposh, who are not of the same religion or origin as the neighbouring Afghans and Tartars. In language, religion, and even physiognomy they are akin to the Hindus. They cherish an hereditary feud with all Mohammedans, and are disposed to claim relationship with the English.

Kaffir Corn. See SORGHO GRASS.

Kaff'irs, or **Kafirs**, the name of a race inhabiting S.E. Africa, from Sofala to the Great Fish River, and inland as far as Lake Ngami and the southern basin of the Zambesi. The word *Kafir* is of Arabic origin, signifying infidel, and was vaguely applied by the old Arab invaders of Eastern Africa to all the non-Mohammedan peoples with which they came in contact. The K. are of a modified negro type, the divergence from the pure negro increasing with the distance from the tropic. They are tall, slimmer than the negro, sinewy, and exceedingly active. Their colour is a dark-brown, which deepens into black in some of the northern tribes. The hair is black and curly, and the skin emits the same peculiar odour as that of the negro, but the lips are less prominent, and the nose is higher and frequently even hooked.

The K. are divided into many independent tribes, each owning allegiance to its own chieftain. In Zululand the principal tribes are the Amazulu and Amatabele; in Bechuanaland the Makololo and Batoka; and in Natal, Kaffraria Proper, and the Transkeian districts of Cape Colony, the Amapondo, Amaxosa, Amagcaleka, Tambookies, Basutos, and Amafengu, or Fingoes. The two last are of Zulu origin, and are more peaceful and inclined to a settled mode of life than the K. The Fingoes (*i.e.*, 'dogs') were reduced to slavery by the Amaxosa, but were set free by Sir B. D'Urban in 1835, and were settled along the frontier as a barrier between their former masters and the colonists, a policy which has proved very successful.

Five great wars have taken place between the K. and the British power in S. Africa. The first, in 1811–12, resulted in the K. being driven out of the Zuurveld into the region E. of the Great Fish River. The second, in 1818–19, was caused by a pseudo prophet, named Makanna, under whose leadership the K. suddenly overran the district from which they had been expelled, and attacked Grahamstown. After a desperate struggle they were completely defeated, and the district between the Great Fish River and Koonap Kat was added to the colony. The third war, in 1834–35, was marked, like the others, by the temporary

success of the K. and their ultimate defeat with great slaughter. The fourth war took place in 1846-48, originating in a wanton outrage perpetrated by the K., who sustained a crushing reverse at the Gwanga. The war resulted in the extension of the British frontier to the Keiskamma, while the territory between that river and the Great Kei was reserved for occupation by the K. under the name of British Kaffraria (see CAPE COLONY). In 1850 the last great war broke out, being instigated by another self-styled prophet named Umlangene. The crisis was heightened by the unexpected rebellion of the Hottentots, and peace was not restored till March 1853. This war alone cost more than £2,000,000. Since then no serious conflict has taken place between the British power and the K., though a sanguinary contest between the Zulus and the Boers of the Transvaal took place in 1876-7. See TRANSVAAL.

The K. are a brave though treacherous race, and are a curious compound of shrewdness and superstition. They have but vague ideas of God, and like most other savages they seek rather to propitiate an evil spirit than to adore a good one. A belief in witchcraft is universal. Nevertheless their reasoning powers are remarkably good. Many of the K., especially in Basutoland and Fingoland, have been converted to Christianity by the missionaries of various denominations. The K. is by nature a herdsman, and does not care much for agriculture. His great care is for his cattle, which form his wealth. Cases exist of K. purchasing and successfully working farms, and (in Natal) sugar-mills, but these are very exceptional, save among the Fingoes. Few also of the K. take to mechanical pursuits or trade. The women build the huts and cultivate the crops of millet and maize. Their position is less degraded than among the Hottentots, though polygamy is general. Before the general introduction of firearms, the national weapons of the K. were assegais or lances and clubs, a large shield of ox hide being carried as a defence. The bow and arrow were not used by the K., though in general use among the Bushmen. A blanket is now the Kaffir's usual garment, having superseded the ox-hide formerly worn. In war time, however, the warriors entirely dispense with clothing, substituting for it a coating of red clay. The Kaffir language is sonorous and pleasing when pure, but on the Cape frontier it has become corrupted by an infusion of the peculiar Hottentot 'clicks' and Dutch words. There is no written character.

It is impossible to arrive at a reliable estimate of the numbers of the K. According to the colonial Blue Book the number of K. in Cape Colony in 1875 was 335,000. To these must be added 220,000 in Kaffraria, 300,000 in Natal, 25,000 in Orange Free State, 1,000,000 in the Transvaal, and probably 1,000,000 more in the regions beyond European settlement, making a grand total of about 2,880,000. See Shooter, *The Kaffirs of Natal* (1857); *Proceedings of the Commission relative to the Kaffirs* (Maritzb. 1852); Maclean, *Kaffir Lands and Customs* (1858); Holden, *Past and Future of Kaffir Tribes* (1855); Thomson, *Travels in S. Africa* (1872).

Kaffra'ria is the name once given to the whole of the coast region of S. Africa between Sofala and the Great Fish River, but now restricted to the independent territory between the Great Kei River and Natal, the inland boundary being the Transkeian districts of Cape Colony. The area thus included forms a rectangle of about 7500 sq. miles. It consists in great measure of a grassy plateau about 2500 feet above the sea level, but near the coast the surface is broken and rugged. The rivers flow in deep *kloofs* or gorges, and are mere torrents unsuited for navigation. The coast is rocky and shelterless. The country is well watered and fertile, and even under the very imperfect cultivation of the Kaffirs yields good crops of maize, millet, and Kaffir corn. The Kaffirs also rear large herds of cattle and goats, whose hides and skins they dispose of to the settlers of Cape Colony. The total absence of roads and bridges, however, and the still uncivilised condition of the Kaffirs, confine the trade to small limits. The principal tribes are the Amapondos and the Amagcalekas. Pop. estimated at 220,000.

Kaffraria, British, now part of Cape Colony (q. v.), but formerly an indepenent settlement, is bounded E. by free Kaffraria, W. by the province of Victoria, N. by that of Queenstown, and S. by the Indian Ocean. Area, 4500 sq. miles; pop. 86,201, of whom 2376 are European grantees, 2327 German settlers, 3380 'other Europeans,' and the remainder are natives, chiefly Amaxosa and Amafengu Kaffirs. The natural boundaries of the country are the Great Kei River in the E., the Keis Kamma in the W., and the bold range of the Amatola Mountains, which attain a height of 5000 feet, in the N. Chief of the many streams of K. are the Chumie, Buffalo, and Gonubi, but none of these are navigable. From the high grassy plateaus of the interior numerous fertile valleys open to the sea. The headquarters of the military and seat of the government are at King William's Town, of which the port is East London, at the mouth of Buffalo River. The territory of K. was occupied after the Kafir war of 1846-47, was made an independent colony in 1861, but was annexed to Cape Colony in 1866.

Kain, a term in Scotch law denoting rent paid in kind.

Kai'ra, the chief town of the district of the same name, Bombay, British India, 265 miles N. of Bombay; pop. (1872) 12,681. It is a well-built walled town, with a Jain temple and other handsome public buildings. The *district* of K., which is much interlaced with the native state of Baroda, has an area of 1561 sq. miles; pop. (1872) 782,733. Cotton, sugar-cane, and tobacco are grown.

Kairwan', a town of Tunis, N. Africa, 75 miles S. of the city of Tunis, with a pop. of 12,000, and manufactures of fur and leather. K. was founded in 672 by the Arabs, was long the capital of Moslem Africa, and is still considered a sacred town. It has 20 mosques and numerous chapels, and to the magnificent Okbah Mosque, resting on 500 pillars, numerous pilgrimages are made.

Kaisariyeh, a town of Asia Minor, in the vilayet of Angora, on the Kara-su (*Melas*), 161 miles S.E. of Angora. It stands in a fertile but highly volcanic district, and has suffered much from earthquakes. Grain, dye-stuffs, and saltpetre are the chief articles of trade. K. is the ancient *Cæsarea* (q. v.), and there are numerous ruins about the town. Estimated pop. 40,000.

Kaiser-i-Hind (Emperor of India), the Persian, or rather Hindostani, title by which Queen Victoria was proclaimed Empress at the great Durbar at Delhi on 1st January 1877. This title, which was settled after much consideration, commends itself to Persian scholars. The term 'Kaiser' has been erroneously conjectured from its spelling to be borrowed from the German, but it is, in truth, a well-known Persian word, derived through the Arabic from the Greek, and is to be found in a hackneyed quotation from the epic poet Firdousi. Persian is the court and diplomatic language of India; and under the disguise of Hindostani, was until lately the regular language of British administration.

Kaiserslau'tern, or **Lau'tern** (*Lutrea*), a town in the Rhenish Palatinate on the river Lauter, 32 miles W. of Mannheim, with breweries, tanneries, iron works, cotton manufactories, and an important fruit market. Pop. 17,867. K. was the scene of a fierce and bloody battle (28th, 29th, 30th November 1793) between the Duke of Brunswick and Hoche, in which the latter was repulsed.

Kákapo, the Maori name of the ground or night parrot of New Zealand, *Strigops habroptilus*, belonging to the family Psittacidæ (q. v.). It is remarkable as possessing a considerable development of wing, and yet never attempting to fly. On this account it is being rapidly exterminated, chiefly by dogs and rats, and is already very rare, except in the wild and uninhabited region at the S.W. extremity of the colony.

Kalafat', or **Calafatu,** a fortified town in the S.W. of Wallachia, on the left bank of the Danube, opposite the Turkish Widdin. It commands a winding stretch of the Danube, and was the scene of severe conflicts between the Russians and Turks in 1829 and again in 1854. Pop. 2500. There was continuous cannonading between K. and Widdin at the beginning of the Russo-Turkish war in May 1877.

Kalamazoo', capital of a county of the same name, in Michigan, U.S., on the river K., 143 miles W. of Detroit by rail. It is the seat of K. College, incorporated in 1855, and attended by ninety-eight male and seventy-one female students in 1872. There is splendid water-power, and the manufactures are extensive, comprising machinery, steel springs, carriages, pianos, &c. There is a fine public park and a driving park, with a superior track. Pop. (1870) 9181.

Kal'be, or **Cal'be**, a town in the province of Saxony, Prussia, on the left bank of the Saale, 10 miles S.S.E. of Schönebeck by rail, carries on spinning, weaving, and manufactures of cloth, frieze, paper, sugar, and tobacco. Pop. (1875) 7940.

Kale, Sea. See SEA-KALE.

Kale is an open-leaved variety of the polymorphous cabbage plant, technically called *Brassica oleracea, acephala*. It is cultivated as a winter and spring vegetable. There are many sub-varieties, some of which are handsomely variegated; hence their use for garnishing desserts, for filling flower beds, or forming the ribbon borders of gardens in winter.

Kalei'doscope (Gr. *kalos*, 'beautiful,' *eidos*, 'form,' and *skopeō*, 'I see'), a philosophical toy invented by Sir David Brewster. Two plane reflecting surfaces are fitted longitudinally in a cylindrical tube, making an angle of 60° with one another. At the one end of the tube is a small hole for looking through, and at the other is a flat glass cell containing fragments of coloured glass. On looking through the tube towards the light, the particular figure in which the fragments may happen to congregate will be observed five times reflected, and these, together with the direct image, form a symmetrical pattern, which may be varied continuously by turning round the tube, and permitting the fragments to take up other relative positions.

Kaleva'la. See FINNISH LITERATURE.

Kali', the goddess who figures most prominently in the Hindu religion. As Parvati, she appears as the wife of the destroyer, Siva; as Durga, she has given her name to the Durga Pujah festival, the great annual holiday of Bengal; her other names are Bhawani and Devi. She has been identified with the Isis of Egypt and the Greek Hecate. K. was not known in the earliest period of the Mahabharata; and there is much plausibility in the theory that her bloody worship, with that of her husband, was borrowed from the aboriginal tribes. It is abundantly established that human sacrifices were, even to a recent period, offered in her honour, though such a practice is most abhorrent to the primitive spirit of Hinduism. K. is represented of a dark blue colour, with distorted countenance, and a necklace of human heads. It is said that the name of Calcutta is derived from K.-ghat.

Kâlidâ'sa, the greatest of all Indian dramatists, according to tradition, flourished in the reign of King Vikramaditya (57 B.C.), of whose court at Ujjayini (Oujein) he was one of the 'nine jewels' or illustrious men. More probably, however, he lived about the commencement of the 3d c. A.D., Lassen assigning him the date 250 A.D., whilst Dr. Bhau Daji places him as late as the reign of a Vikramaditya of the 6th c. He wrote but three plays, the *Sakuntala*, *Vikramorvasi*, and *Malavikagnimitra*, of which the first and by far the most celebrated exists in three recensions, the Bengali, Devanagari, and one in the S. of India. It has been translated into English by Sir W. Jones (1789) and Monier Williams (1853; verse trans. 1856), into French by Chezy (1830), and into German by Forster (1790), Meyer (1851), and four others. The best editions are by Böhtlingk (1842) and Pandit Tarkabagish (1860). This drama elicited the unqualified praise of Goethe, and is styled by Max Müller 'the finest of Eastern gems.' K. was also author of three of the six *Mahakavyas* ('great poems') and of the *Ritu-samhara*, a short but well-known poem on the six seasons of the year. These last are often truly poetical and display a fertile imagination, but are too studied and artificial, being marred by a puerile love of alliteration and play upon words. See Monier Williams, *Indian Wisdom* (Lond. 1876).

Kaliha'ri, or **Kalaha'ri Desert**, a waste region in S. Africa, between 21°–29° S. lat., and 19°–25° E. long., covering an area of 200,000 sq. miles. It is a plateau of light-coloured soft sand, about 3700 feet above the sea-level, and during most of the year is rainless. The surface is nevertheless clothed with a dense vegetation of bushes and creeping tuberous plants, which support large herds of antelopes, while lions, leopards, and other carnivora are to be found near the few places where water exists. The K. D. is inhabited by wandering tribes of Bushmen, and by the Bakalahari, a pastoral race of Bechuana origin. They manage to extract water from the ground at a few 'sucking-places' and trade chiefly in karosses, or skin-mantles.

Kal'isz, or **Kal'ish** (probably the *Calisia* of Ptolemy), a walled town in the government of the same name, Russia, on the Prosna, 62 miles N.E. of Breslau, with great trade and manufactures of cloth, was the scene of August II.'s victory over the Swedes 27th October 1706, and of the Russo-Prussian treaty of 28th February 1813. K. was founded in the 7th c. Pop. about 20,000 (7500 Jews).

Kal'mar, a seaport town in the Swedish län of the same name, on the W. shore of the Kalmarsund, opposite Oland, and 48 miles N.E. of Karlskrona, with important ship-building, manufactures of sugar and tobacco, and large trade, especially in wood and fish. There is a fine cathedral, and in the old castle, Kalmarslot, was concluded the Union of Kalmar (1397). Pop. (1868) 9421; of län 236,503.

Kal'mia, a genus of N. American evergreen shrubs belonging to the heath family (*Ericaceæ*), and so named by Linnæus after his fellow countryman, Peter Kalm. Various species are frequent in gardens, from the large growing *K. latifolia* to the small *K. glauca*. The leaves and shoots are deleterious to cattle, whilst honey from the flowers, and the flesh of game fed on the berries are poisonous to man.

Kal'muks (called by themselves *Derben-Eret* or *Dörbön-Oirat*, and by the Tartars *Khalimik*), **Oelöt**, or **Eleutes**, the most numerous of the Mongol races, are partly Chinese, partly Russian subjects, and extend from the steppes of the Don and Volga to the deserts and mountain ranges of Upper Asia. Four distinct types are recognised, the Khoshots, the Dsongars, the Derbets, and the Torgots. It is from the K. that the unfavourable descriptions of the Mongols as flat-faced and of a dirty yellow complexion have been drawn. Yet they are now considerably intermingled with their neighbours the Russians, Persians, and Turks. The history of the K. is closely connected with the great Asian conquests from Attila to Timur. They are mostly Buddhists, and are nomadic and warlike, living in felt-covered tents, their possessions being horses and sheep. Their priests have a sort of theological learning drawn from Chinese and Tibetan sources. See Latham, *Native Races of the Russian Empire* (Lond. 1854), von Hellwald, *The Russians in Central Asia* (trans. by Wirgman, Lond. 1874).

Kaloc'sa, a town in the comitat of Pesth, Hungary, near the Danube, 170 miles S.E. of Vienna, has a cathedral, an archbishop's palace, and a library of 30,000 vols. Pop. (1869) 16,302.

Kalong' (*Pteropus*), the name given to a genus of *Cheiroptera* (q. v.), or bats, forming the type of the *Frugivorous*, or fruit-eating group of the order. The K. proper is the *Pteropus Edulis* of Java, but the Roussette (*P. rubricollis*) is another familiar species. The name 'flying fox' is often applied to the K., from the shape of the head. The fur is usually reddish. The K. flits about at night, feeding on fruits and vegetable matters. It inhabits the Eastern Archipelago. The first-named species may attain an expanse of wings measuring 4 or 5 feet, and includes some of the largest of the Cheiroptera.

Kalu'ga, a central government of Russia, lies immediately S.W. of Moscow. Area, 11,934 sq. miles; pop. (1870) 984,255. It is a fertile plain, watered by the Oka, Shisdra, and Ugra, and of which one-half is cultivated and one-fourth covered with forest. Hemp is one of the chief crops, and there is an active industry in coal-mining and in making sailcloth and other coarse wares.

Kaluga, the capital of the government, lies at the confluence of the Oka and Jatschenka, 115 miles S.W. of Moscow. It is a beautiful town, the seat of a bishop, and has thirty-five churches, a great artillery park, large powder magazines, manufactures of leather, sailcloth, oil, sugar, &c., and an important trade in corn, oil, and honey. Pop. 38,608.

Ka'ma, or 'little Volga,' the largest affluent of the Volga in Russia, rises in the woods that clothe the W. slopes of the Urals, in Viatka. It flows in a S.W. direction through Perm, Orenburg, and Volga, and has a length of 1100 miles, of which all but 40 miles are available for an important traffic. The K. abounds in salmon and other fish.

Kam'ala, or **Wurr'us**, is a fine, granular, orange-red powder, which consists of the minute glands that cover the capsules of

Rottlera tinctoria, imported from India, where it is used as a dye for silk. K. is a purgative, and has been extensively used in India in the treatment of tape-worm. The worm is generally passed entire, and almost always *dead*, the head being generally detected. Dose, 60 to 120 grains of the powder, suspended in gruel, mucilage, or syrup, followed, if necessary, by half a fluid ounce of castor oil. A second dose is seldom required.

Kamieniec' Podolsk', the capital of the government of Podolia, Russia, near the border of Austrian Galicia, on a steep chalk rock overlooking the Smotrycza, 9 miles above its entrance into the Dniester. It consists of a lower and upper town, is the seat of a Greek archbishop, and of a Roman and an Armenian bishop, and has an old castle, a beautiful Gothic cathedral, and a considerable trade, mostly in the hands of the Jews. Pop. 22,611. K. was long one of the strongest bulwarks of Poland against the Turks, and fell to Russia in 1793.

Kam'pen, a port in the province of Over-Yssel, Netherlands, at the mouth of the river Yssel, 43 miles N.E. of Amsterdam, is a neat town, with important trade. Pop. (1875) 12,163.

Kampti', a flourishing town in the District of Nagpore, Central Provinces, British India, on the right bank of the river Kanhan, 9 miles N.E. of Nagpore, and 520 miles E. of Bombay by rail. Pop. (1872) 48,831. There is a cantonment here for all arms, established in 1821, from which time dates the prosperity of the town. The trade is very large, consisting chiefly of agricultural produce, timber, cotton-goods, and salt; in 1868–69 the imports were valued at £595,083, the exports at £187,607.

Kamptu'licon, the name given to a kind of floorcloth invented about 1843 and prepared by incorporating ground cork with masticated caoutchouc, rolling the mass into sheets and drying. It may be readily stained with mosaic or other patterns. It wears well, is waterproof, and much warmer than the ordinary oilcloth. The manufacture of K. received a great impetus through Sir Charles Barry employing it to cover the corridors of the Houses of Parliament. In inferior varieties of K., oxidised linseed oil, sawdust, peat, chalk, pitch, and other matters are often combined.

Kamrup', a district of Assam, British India, on both banks of the Brahmaputra; area, 3631 sq. miles; pop. (1872) 561,681. The chief town is Gowhatee (q. v.). K. is famous as the centre of a great Hindu kingdom of this name, which extended over all N. Bengal and Assam before the Mahommedan conquest.

Kamtchat'ka, a peninsula in the E. of Siberia, and in the Russian coast province, extends in a southerly direction, enclosing the Sea of Okhotsk on the E. It is 850 miles long, and has an extreme breadth of 250 miles, is traversed from N. to S. by two parallel ranges of volcanic mountains. Of the twelve active volcanoes, Kliutschevskaia (16,152 feet) is the highest in Asia, and was in full irruption in 1829. The only considerable river is the K., which is 150 miles long, and waters one of the few valleys of the peninsula, extending between the two mountain ranges. Even in the valleys the climate does not admit of cultivation, and the soil is for the most part stony. Winter lasts for nine months, and severe frosts frequently extend into summer. There are forests of birch and pine. Among the wild animals are the bear, sable, fox, otter, wolf, seal, and beaver. The only domestic animal is the dog, a peculiar species, that lives on fish, does not bark, and is used in drawing sledges. The inhabitants, about 20,000 in number, are mostly Kamtchadales, Korjäkes, and Lamuts. The chief town, Petropaulovski (q. v.), on the E. coast, is the centre of the Russian fur trade. K. was annexed to Russia in 1697.

Kam'yshin, a town in the government of Saratov, Russia, on the W. bank of the Volga, 120 miles below Saratov. It has many large workshops and gardens, and in the vicinity is a German colony. Pop. 15,698.

Kanaga'wa, a seaport of Japan, on the W. side of the Bay of Yedo, and 2 miles N. of Yokohamo, on a railway between the latter town and Yedo. It was opened to foreign commerce in 1859, and rapidly became the seat of an extensive trade, which of late years has in great part been transferred to Yokohamo. K. is still the seat of the foreign consuls. Its trade is not represented in separate returns. It is 18 miles by rail S. of Yedo, and the total receipts for goods and passengers between K. and Yedo was 431,576 dollars in 1875. Pop. estimated at about 60,000. The exports are raw silk, tea, silkworm-egg cards, cocoons, lacquer ware, copper, and tobacco.

Kana'ris, Konstantin, born about 1790 in the Greek island Ipsara, originally an obscure shipmaster, distinguished himself during the Greek War of Independence by destroying Turkish war ships. On the 19th June 1822 he burned the admiral's ship at Chios, and on the 22d November another admiral's ship at Tenedos. On the 17th August 1824 he revenged the devastation of Ipsara by burning some Turkish ships at Samos, and delivered that island from a similar fate; but failed in an attempt to destroy the fleet at Alexandria in August 1825. From 1827, when he was set over a squadron, he frequently held the office of Minister of Marine under King Otho, who, in 1861, offered him the admiralship, which he declined. K. was with a brief interruption Premier of Greece from March 1864 to March 1865. K. is President of the Council and Minister of Marine in the new Cabinet formed June 1877.

Kanda'vu, one of the principal islands of the Fiji group (q. v.), situated in 19° S. lat., 178° 15′ E. long. It is 26 miles long, and of very irregular form, being only half a mile wide in the centre. At the W. extremity is Mount Washington (3800 feet), the highest peak in the Fiji Islands. K. is the calling-place of the mail steamers running between San Francisco, Sydney, and New Zealand.

Kane, Elisha, Kent, M.D., a celebrated American traveller, was born at Philadelphia, February 3, 1820. After graduating at Pennsylvania University in 1843, he entered the navy, and visited China as physician to the embassy. Subsequently he travelled in Egypt and Western Africa; and on his return to America in 1846 served in the Mexican War. In 1850 he accompanied the first Grinnell expedition in search of Sir John Franklin as surgeon. In the second expedition (1853-55) he acted as commander and reached what he regarded as an open polar sea in N. lat 80° 20′. His health was so injured by the hardships which all Arctic explorers have experienced that he died within eighteen months after his return, at Havana, February 16, 1857. He wrote narratives of the two expeditions, entitled *United States Grinnell Expedition in search of Sir John Franklin* (1853, 2d edit. 1857), and *Arctic Explorations in the years* 1853, 1854, *and* 1855 (2 vols. 1856).

Kane, Sir Robert, M.D., F.R.S., an eminent chemist, was born at Dublin in 1810. He commenced his studies at Meath Hospital, and obtained his diploma in 1832. The same year he projected the *Dublin Journal of Medical Science*, which he edited till 1834. Shortly after he was elected professor of chemistry to the Apothecaries' Hall, a post which he resigned in 1845. From 1844 to 1847 he was professor of natural philosophy to the Royal Dublin Society, and in the latter year he obtained the Cunningham gold medal from the Royal Academy for his discoveries in chemistry. He took an active part in the formation of the Museum of Industry at St. Stephen's Green, of which he was created director in 1846. The same year he was knighted and was appointed one of the Irish Relief Commissioners. In 1864 he resigned the presidency of Queen's College, Cork, which he held for several years previously. As an author he is best known by his *Elements of Chemistry* (1842) and his *Industrial Resources of Ireland* (1844); but besides these he has written valuable memoirs on chemical subjects, notably one *On the Colouring Matter of Lichens* in the *Philosophical Transactions* (1840).

Kangaroo', a genus of quadrupeds belonging to the order Marsupialia (q. v.), and found only in Australia and a few of the neighbouring islands. Fifty-six species have been described. The true K. (*Macropus*) measures about 5 feet in length from the tip of the nose to the root of the tail, and to the extremity of the latter organ fully 3 feet more. The fore-legs are very much shorter and weaker than the hind-legs, and serve rather as arms, the K. not using them in progression, though it rests upon them when feeding. The toes on each of the fore-paws are five in number, and are furnished with claws. The hind-feet are unusually long, the tarsus without the claws measuring 12 inches

in length. The toes are only four in number, and the fourth is armed with a very large solid claw. The tail is very muscular, and sometimes measures a foot in circumference at the root. It materially aids the K. in its mode of locomotion, which consists of a series of bounds on the hind-feet alone, the distance covered by every such leap sometimes exceeding 15 feet. The head is small and elegantly shaped, the ears and eyes large. The teeth consist of eight incisors, four premolars, and sixteen molars. The K. feeds upon grass and the leaves of bushes, and has been observed to chew the cud.

Kangaroo.

The K. as a rule is a mild and timid animal, but the larger species, such as *M. major* (called 'old man' or 'boomer' by the colonists), and *Ophranter rufus*, the great red K., fights desperately when driven to bay. The great K. (*M. major*) is not found in the north of Australia, but some of the species are found all over the continent. They are in most cases smaller than *Macropus*, and possess other points of difference. Two species of terrestrial K., belonging to the genus *Dorcopsis*, inhabit New Guinea and the Aru and Mysol Islands. The tree K. (*Dendrolagus*), also indigenous to New Guinea, by an elongation of the fore-paws is enabled to climb trees, upon whose foliage it feeds.

Kangaroos have so increased in numbers in Australia in consequence of the extermination of the Dingo (q. v.), that the squatters or large sheep-owners find it necessary to have *battues* occasionally to keep them in check, and a law designed to have the same effect was passed by the Queensland Legislature in 1876. The K. breeds freely in captivity, and has been successfully acclimatised in the open ground in the parks of noblemen in the S. of England, as well as in France.

The flesh of some kinds of K. is excellent eating, and K.-tail soup is now largely manufactured for use on shipboard, &c. The furs of the smaller kinds are beginning to be sought after, and first-rate leather is made from the hides of the larger species.

Interesting discoveries of fossil remains of the K. have been made in cave deposits and other post-Tertiary strata of Australia. Among the extinct genera of which remains have been found is the diprotodon, which appears to have occupied a place between the K. and the Wombat (q. v.), and is believed by Professor Owen to have been as large as a rhinoceros.

Kangaroo Apple, the popular name of the plant *Solanum laciniatum*, found in Australia, Tasmania, and Peru. When ripe the fruit is wholesome, but when unripe it is acrid and dangerous.

Kangaroo Grass is the colonial name of *Anthistiria Australis*, the most generally distributed plant in Australia. It is tall, with long twisted awns, and is much prized as fodder for cattle.

Kangaroo-Rat, Potoroo, or **Bettong**, are names given in Australia to marsupial animals belonging to the genus *Hypsiprymnus*, of the family *Macropodidæ*. They differ from the true kangaroos in having a distinct canine tooth in the upper jaw, in the œsophagus being removed from the commencement to the termination of the middle division of the sacculated compartment, and in the fore-feet and claws being adapted for burrowing. The tail, also, is not used to assist locomotion, but in the sub-genus *Bettongia* it is in some degree prehensile. The K.-R. is about the size of a hare or rabbit, and subsists upon roots and grasses. About a dozen species are known, the chief of which are *H. rufescens, H. murinus*, and *H. cuniculus*. The last, which is also the largest, is confined to Tasmania.

Kangaroo Thorn, is *Acacia armata*, much grown in Australia for hedges, forming an impenetrable fence.

Kang'ra, the chief town of the district of the same name, Punjaub, British India, is the site of an extensive hill-fort or *kot*, of historical importance.—The *district* of K., which lies among the Himalayas N.W. of Simla, has an area of 8988 sq. miles; pop. (1868) 743,882. Wheat, barley, and rice are the food crops. Tea cultivation was introduced here at an early date. In 1872, there were twenty-eight plantations, with a yield of 428,655 lbs.; the yield per acre was 130 lbs. Potatoes, also, are now extensively grown. A fair established in 1867 at Palampore, for the trans-Himalayan trade, is annually attended by 30,000 persons.

Ka'no, a town of Houssa, Central Africa, is the great entrepôt of English and American wares, the former coming from the N. across the desert of Sahara, the latter from the Bight of Benin. Cloth-dyeing is an important native industry, which has rendered K. famous throughout the whole of Central Africa. Estimated pop. 30,000 to 40,000.

Kan'sas, a State of the American Union, bounded E. by Missouri, W. by Colorado, N. by Nebraska, and S. by the Indian territory. Area, 81,318 sq. miles; pop. in 1860, 107,206; in 1870, 373,299; in 1874, nearly 600,000. The country slopes gently from the base of the Rocky Mountains to the river Missouri, which forms part of the eastern boundary, and receives from K. the river of the same name. The K. River is of no commercial value; it receives the Republican, Solomon's Fork, Big Blue, Grasshopper, and innumerable smaller tributaries. The only other important river is the Arkansas, a tributary of the Mississippi. According to the State Agricultural Report, 95 per cent. of K. is prairie, and only 5 per cent. forest. The river-bottoms of the centre and E., in which the loam is often 50 feet deep, are grown with forests of cotton-wood, red and white elm, oak, black walnut, sycamore, cedar, maple, &c.; in the W. the grama and buffalo grasses afford excellent pasture. Agriculture is being profitably carried far W. of the margin of what was known as the 'Great American Desert.' In 1874 there were 3,669,769 acres under cultivation, and the total value of the crops was nearly 30 million dollars; the amount of winter wheat was 6,870,606 bushels; of spring wheat, 3,010,777; of corn, 12,283,142; of oats, 4,064,424; of potatoes, 1,497,328; of sorghum, 540,338 gallons; of cotton, 11,657 lbs.; of flax, 265,704 lbs., and of tobacco, 29,384 lbs. In the same year K. had 202,962 horses, 749,959 cattle, 22,034 mules and asses, 84,838 sheep, and 356,916 swine. The cheese made amounted to 430,849 lbs., and the butter to 7,457,110 lbs. Among the wrought minerals are bituminous coal, lime, marble, salt, gypsum, and kaolin; there are considerable deposits of brown hæmatite and other iron ores, which have been worked but slightly. The aggregate coal-measures have an area of 22,256 sq. miles. The climate is temperate and healthy. Leavenworth (q. v.) is the largest city; Topeka is the capital, and other towns are Lawrence, Fort Scott, and Wyandotte. In 1874 the 1839 miles of railway were completed; two lines, the K. Pacific and Atchison, Topeka, and Santa Fé, traverse the State from E. to W. K. was organised as a territory in 1854, and, after a long and fierce struggle between northern and southern settlers, slavery was prohibited, and the territory was admitted to the Union as a State in 1861. The growth of its population is unparalleled even in the United States for rapidity. A disastrous visitation of grasshoppers or locusts destroyed one-third of Indian corn crops in 1874.

Kansas, a city of Missouri, U.S., one mile E. of the K. frontier, on the right bank of the Missouri, just below the mouth of the K. river, is the centre of an immense land and river traffic, and the converging point (1875) of nine completed railways, and of four or five others in course of construction. Its chief trade is in live-stock, the completion (1873) of a railway line having connected it with the great stock-raising regions of Texas. The receipts of cattle in 1875 were 227,669, valued at $3,415,035; of hogs 220,956, valued at $2,131,178. The pork-packing business has increased from 13,000 hogs in 1868 to 200,000 in 1873. The amount of grain received in 1873 was 1,718,280 bushels. The whole Missouri valley as far N. as Omaha is supplied with coal from the vicinity of K. The Missouri is crossed by a bridge 1400 feet long, erected at a cost of one million dollars. Pop. in 1860, 4418; in 1870, 32,260.

Kan-su, a province of China, lies between Tibet in the S. and Mongolia in the N., and has an estimated area of 260,599 sq. miles; and a pop. of 19,512,716. It is in great part mountainous, and is traversed from E. to W. by the winding upper course of the Hoang-ho. The capital is Lan-chow.

Kant, Immanuel, the founder of the German philosophy, was born at Königsberg, 22d April 1724. In 1740 he became a student of theology in the university of his native town, but applied himself principally to philosophy, mathematics, and physics. After fifteen years spent as *privat docent,* he was made at the age of forty-six Professor of Philosophy, and in 1781 published the first edition of his great work the *Kritik der reinen Vernunft* ('Critique of the Pure Reason'). In 1788 appeared the *Kritik der Praktischen Vernunft* ('Critique of the Practical Reason') and in 1790 the *Kritik der Urtheilskraft* ('Critique of the Faculty of Judgment'). K. led a very quiet life, and always refused to quit his native town. Besides being eminent in philosophy, he was also one of the greatest authorities of his time upon physical geography. He died February 12, 1804. K.'s philosophy is mainly a theory of perception, and comes in logical and historical order after that of Hume. The latter, following out the consequences of the extreme nominalism of Berkeley, had reached the conclusion that in ultimate analysis all existence was reducible to a train of atomic sensations, standing in no real relation to one another except that of succession. All other relations, and notably that of cause and effect, were therefore fictions superinduced by the associative power of the mind. K. saw that if this were admitted all knowledge or experience which is made up of these relations, and depends particularly upon the invariability of the law of cause and effect, must be a delusion, for if the sensations which are at present the objects of consciousness stand in no real relation to those which may in future be so, the belief in uniformity of nature must be without any true foundation. He saw, moreover, that this uniformity is presupposed by all human intelligence, and therefore he set himself to investigate the nature and limits of human knowledge in the *Kritik der reinen Vernunft,* the results of which may be briefly summarised as follows:—The antithesis between subject and object is partially at least transcended in the conclusion that the mind, far from being merely passive in experience, is really the main factor in its constitution. Into perception, according to K., there enter the following elements: (*a*) the action of an unknowable thing in itself upon mind, supplying to it a chaotic manifold of sensation, which (*b*) is received into the pure forms of sensibility, in one or both of which thought apprehends all its objects, time and space, and (*c*) arranged in certain definite intelligible relations termed categories (relations of quantity, quality, causality, substantiality, &c.) by the constitutive action of that pure impersonal thought called by K. the synthetic unity of transcendental apperception, which is identical in all individual thinking, being without the sphere of time. Experience as thus constituted is the only legitimate object of reason, which whenever it seeks to transcend it and speculate about metempirical entities such as God or the soul, falls into certain inevitable self-contradictions called antinomies. The only reality, so far as science is concerned, is the region of time and space, all else is unknowable.

With this result K. commences the investigation in the *Kritik der Praktischen Vernunft* of the question, Can reason determine the will independently of experience? The will being a thing in itself is obviously free from that law of causality which rules in the region of experience only, and it is therefore capable of determination by itself, that is by reason, for K. practically identifies the two. But the only law of action which can be laid down *a priori* apart from experience is this, to act at all times from a maxim fit for being made a universal principle of conduct. For the fulfilment of the moral postulate of a harmony between duty and wellbeing, there is necessary a future state and a moral orderer of the universe, two results which in the *Kritik der reinen Vernunft* were found to be theoretically unprovable.

Midway between simple apprehension and reasoning lies judgment, which, as its function is to subsume the particular under the universal, naturally refers the empirical plurality of nature to a supersensual transcendental principle as ground of unity to this plurality. The *Kritik der Urtheilskraft,* therefore, deals with the conception of design in nature, and seeks to show that there is no contradiction between the mechanical and teleological explanations, since the co-operation of percipient thought with things in themselves in the constitution of nature affords two distinct points of view from which to regard it. This *Kritik,* though the least known, was perhaps the most important of the three in its results, for out of its principles grew the majority of the salient features in the post-Kantian metaphysics.

Besides the three Critiques, K. published *Religion innerhalb der Grenzen der blossen Vernunft,* in which he applies the critical method to theology, the *Metaphysische Anfangsgründe der Naturwissenschaft,* the *Grundlegung der Metaphysik der Sitten, Prolegomena zu einer jeden künftigen Metaphysik,* with a number of other less important works. His successors submitted his system to a thorough criticism, the outcome of which was the rejection of the doctrine of things in themselves, and the declaration that the world of experience, which to K. was only phenomenal, was the only reality, in other words, a thoroughgoing identification of knowing and being. This was effected chiefly by Fichte, Schelling, and Hegel (q. v.). Modern German philosophy is tending strongly to seek in K. a foundation for its metaphysico-empirical speculations.

The leading English works upon K. are Professor Caird's *Philosophy of K.* (1877), and Professor Mahaffy's *Critical Philosophy for English Readers.* An excellent *Introduction to the Critical Philosophy* has been written by W. H. S. Monck. There are translations of the *Kritik der Reinen Vernunft* and the *Prolegomena* by Meiklejohn and Mahaffy respectively, of the *Metaphysik der Sitten* by Semple and Abbott, the former of whom has also translated the *Religion innerhalb der Grenzen der blossen Vernunft.* See Borowski, *Darstellung des Leb. und Charact. Kants,* 1804, and Schubert's *K.'s Biographie* in *K.'s Werke* edited by Rosenkranz and Schubert (Leips. Voss, 1838–42, 12 vols., also in 8 vols. 1867–69). There is also a good edition of K.'s works by Hartenstein, Modes, and Baumann (10 vols. Leips. 1838–39).

Kaolin, or **Porcelain Clay,** is the clay which results from the decomposition of Felspar (q. v.), water replacing the potash and part of the silica. It occurs in Cornwall, near Limoges in France, and in Saxony; also in China and Japan. The word K. is of Chinese origin, being a corruption of *Kauling* or *high-ridge,* the name of a hill near Jauchan Fu, where the material is obtained in quantity. All our finer porcelain ware is made of this clay, the constitution of which may be represented by the formula $Al_2 O_3, 2SiO_2 + m H_2O$.

Kap'ila. See SANKHYA.

Kar'aites (Heb. *karaim,* 'scripturists'), were a sect which sprang up about the middle of the 8th c. among the Jews in the E. The founder of the sect was Anan ben David. He and his followers rejected the Talmud, and set themselves to the study of the Old Testament; although their literature was not confined to this subject alone, but embraced almost the whole domain of theology. The sect, which soon spread among the Jews in the W., now drags out a feeble existence in a few communities. The ten articles of their creed are—(1) All things were created (2) by an uncreated being, (3) who is without form, and is in every respect one alone; (4) who sent Moses, and (5) by Moses his perfect law, which (6) the faithful are bound to know; (7) who guided the prophets by his spirit, who (8) will raise the dead, and (9) judge them according to their works; who (10) has not rejected his people, but has sent them salvation by Messiah the son of David. See Blunt's *Dict. of Sects, &c.* (1874).

Karaka is the name given by the New Zealand natives to the tree *Corynocarpus lævigata.* See CORYNOCARPUS.

Karaman', a decayed town of Asia Minor, in the vilayet of Konieh, 64 miles S.E. of the town of that name, contains from two to three thousand houses, mostly like the mosques in ruins, and has some manufactures of coarse cotton and woollen stuffs. Estimated pop. 12,000. The former eyalet of K. corresponded to the modern vilayet of Konieh (q. v.).

Karam'sin, Nicolas Michailovitch, the best of Russian historians, born at Michailovka in the government of Orenburg, December 12th, 1765, was educated at Moscow, and served while young in the army. On returning from a lengthened tour through Germany, France, and England, he published with success his *Letters of a Russian Traveller.* Making literature his profession, he founded the *Aglaia,* a review, and the *Moscow Journal,* many numbers of which were said to be entirely written by himself. His labours soon obtained for him the post of imperial historiographer, a sinecure giving him both leisure and means, which he devoted to his life's work, the *History of*

Russia. Thirteen years of incessant toil were bestowed upon the first eight volumes of this history; but its success rewarded the author abundantly. In 1824 other three volumes appeared, bringing the account down to the reign of Ivan V., but the twelfth and last volume had to be written by the author's friend Bludov, minister of interior. K. died, 3d June 1826. An edition of his works in 18 vols. was published at St. Petersburg in 1835, to which additions with his correspondence were made in 1862.

Karasu'-Bazar, a town of Russia, in the Crimea, on the Karasu, 26 miles E.N.E. of Simferopol. The manufactures, which are in the hands of the Jews and Armenians, are of morocco, candles, soap, &c. Pop. (1870). 11,669.

Karatchef', a town of Russia, in the government of Orel, 24 miles W. of Briansk, on the Snesheta, existed in the 12th c. In its neighbourhood are hundreds of oil-mills and tar-furnaces. Pop. (1870) 11,267.

Kare'lia, the old name of the S.E. part of the grand duchy of Finland and the adjoining tracts of Russia.

Karens', a hill tribe in British Burmah, numbering about 330,000 souls. Some wander about the hills, while others have settled as cultivators on the plains. Their traditions have a singular Jewish tinge, and they have afforded to the American Baptist and French Roman Catholic Missions a most successful field of labour. Out of 330,000 in all British Burmah, about 30,000 have been converted. They have also signalised themselves by their readiness to accept British rule. See *The K. of the Golden Chersonese*, by Colonel Macmahon (Lond. 1876).

Karikel'. See CARRICAL.

Karl the Great, the greatest of the Frankish kings, in whose person the dignity of Roman Emperor was first conferred on a Teuton, was the elder son of Pippin the Short, and succeeded, on the death of his father in 768, to the western half of the Frankish state, which extended from Frisia to the Pyrenees; Elsass, Burgundy, and Provence, however, forming part of the inheritance of Karlmann. K. had previously received the titles of king and Roman patrician from the Pope. After reducing the rebellious Duke of Aquitaine, K., in spite of the threatened anathema of Pope Stephen III., married the daughter of Desiderius, King of the Lombards, whom he shortly afterwards repudiated for Hildegarda, the daughter of the Suabian King. The first of K.'s Capitularies, passed at the *Mallum*, or National Assembly of 769, prohibited priests from having several wives and from following the army. After the death of Karlmann had given K. an opportunity of seizing the inheritance of his nephews, who fled with their mother Gilberga to Lombardy, the great war against the Saxons, between the Rhine, the Weser, and the Elbe (which lasted thirty-three years), was begun, and in 773–74 was followed by the successful expedition against Pavia and other Lombard strongholds, which was undertaken at the suggestion of Pope Adrian I., and which procured for K. the title of the King of the Lombards. Friuli, Switzerland, and the turbulent Tassilo of Bavaria now acknowledged the Frankish supremacy; many of the Westphalian Saxons were compelled to submit, attended the National Assembly of Paderborn in 777, and received Christian baptism. Soon after, K. was recalled from Aragon and Catalonia (where he had assisted the Abbasside faction against the Ommiad Calif of Cordova) by the insurrection of Wittikind (Widukind) on the Rhine. On the way, the ambuscade of Roncesvaux took place. In 781 several matters took K. again to Rome; the proposed marriage between his eldest daughter and Constantine V., the son of Irene; the slave-traffic with the East; and the quarrels between the Pope (who claimed Lombardy as a gift from K.) and the Italian dukes. The severity with which, at the close of the war in Brunswick, K. punished the second revolt of Wittikind, protracted the Saxon struggle for independence till 785, when Wittikind became a Christian. Soon after, the allegiance of the Thuringians, the Bretons, and the S. Lombards was secured. The successful campaigns against the Slav population between the Elbe and the Oder, and against the Huns, were followed in 793 by the apostasy and revolt of the Saxons, and the Saracen invasion of Aquitaine (the district between the Loire, the Rhone, and the Ebro.) In 796 the celebrated Council of Frankfurt was held, in which image worship and the Felician heresy were condemned, K. publishing the *Karoline Books* on the former question. The revolt against Pope Leo III. gave K. an opportunity in 800 of revisiting Rome. The dignitaries of the Church declined to inquire into the charges brought against the Pope, who declared his innocence, and his enemies were found guilty of calumny. In return for this the Pope crowned K. Emperor of the Romans, and endeavoured to unite the two empires by arranging a marriage between K. and Irene. In the year 801, among the embassies who sought K.'s favour from Spain, Constantinople, &c., came one from Harun-al-Raschid, bearing the keys of the Holy Sepulchre. At this time begins the more continuous series of *Capitularies* which throw so much light on the ecclesiastical, military, and social affairs of the time. They deal with such matters as benefit of clergy; the feudal and personal obligations of military service; the imperial deputies or assize judges, called *Missi Dominici*, who also looked after the revenues of the royal cities, and minutely regulated agriculture and trade; the system of personal laws under which K.'s Saxon, Lombard, and Frankish subjects lived. In 804, in order to make room for Slav tribes who had acknowledged his supremacy, the 'Consul' repeated his favourite policy of transporting to Gaul and Lombardy great bodies of Saxons from beyond the Elbe. He also seconded the efforts of Ingo, the evangelist of the Avars. At the Assembly of 806 the empire was divided between K.'s three sons—Karl, Hludwig, and Pippin: the first obtaining the northern part of Gaul and Germany; the second Italy and Bavaria; the third Aquitania, Burgundy, Provence, and the March of Spain. About this time the successes of the Moors, the Greeks, the Danes or Normans, at various points of the vast frontier, showed the real insecurity of the empire; they resulted in treaties of peace in 810, K. apparently feeling that he should now act on the defensive. In that year and the following his sons Pippin and Karl died, and Hludwig was accordingly solemnly crowned emperor by his father in the church at Aachen, the consent of the Assembly having been obtained. K. now gave himself up to devotional exercises, almsgiving, and the revisal of sacred books. He died after a short fever January 28, 814, at Aachen, where also he was buried. Boulainvilliers praises K. as the founder of perpetual succession in fiefs, De Mably as the protector of the common people against the nobles, Montesquieu as a model legislator, others have described him as a perfect hero. His secretary, Eginhard, has left a pleasing picture of the simplicity of his manners, of his eloquence in Latin, which he knew as well as his native German, though he never learned to write, of his anxiety to promote learning, which induced him to invite the teachers of grammar and arithmetic from Rome to fill his public schools, and to assist Alcuin in founding the academy and school of the palace. K. was undoubtedly a religious, patriotic man, affectionate to his family, and having a high conception of his public duty. See Sismondi, *Histoire des Français;* Dippold, *Leben Kaiser K.'s des Grossen* (Tub. 1810); Gaillard, *Histoire de Charlemagne* (4 vols. Par., 2d ed. 1819); Abel, *Jahrbücher des Frank. Reichs unter K. dem Grossen* (Berl. 1866 *et seq.*); Lorenz, *K's. des Grossen Privat- und Hofleben* in Raumer's *Histor. Taschenbuch* (1832); Gagern, *K. der Grosse* (Darmst. 1845); Kitchen, *History of France* (Lond. 1873), and Freeman, *Historical Essays* (Lond. 1872).—**Karl IV.**, *Emperor of the Romans*, born May 14, 1316, was the son of Johann of Luxemburg, King of Bohemia, and succeeded to the empire on the death of Ludwig of Bavaria in 1317, but not without many disputes among the electors, who were alarmed by the deference paid by K. to the Pope. After being consecrated in Rome in 1354, he published his celebrated Golden Bull, which names the seven electors, the Archbishops of Mainz, Köln, and Tryer, the King of Bohemia, the Kur-graf, the Duke of Saxony, and the Markgraf of Brandenburg. He then irritated the Pope, by asking for Church reform when the empire was overrun by brigands. He almost destroyed imperial influence in Italy (where the *Visconti* were now powerful) by selling towns and territories. The 'Alliance of Suabia' was formed during his reign. He died at Prag, November 29, 1378. See Pelzel, *Geschichte Kaiser K. IV.*, and Dönniges, *Geschichte des Deutschen Kaiserthums im 14 Jahrh.* (Berl. 1841).—**Karl V.**, born at Ghent, February 24, 1500, son of Philipp the Handsome, Archduke of Austria, and of Juana, a daughter of Ferdinand and Isabella of Aragon and Castile. Carefully educated by Guillaume of Croy, and Adrian of Utrecht, he became, on the death of Ferdinand in 1516, the first king of Spain. He had previously been called the Prince of Asturias. His mother was associated with him on the throne, and Ximenes

acted as Regent. In 1519, on Maximilian's death, he was elected to the imperial throne in preference to François I. Almost his first act was to call the Diet of Worms for the suppression of Luther's heresy. War soon broke out with France, and after the unsuccessful attack on Mézières, K. concluded with Wolsey a treaty against France, promising to marry the Princess Mary of England. The French being driven from Milan with the help of Leo X., K. put down the *Santa Junta* formed by the Spanish towns. The struggle in Piedmont ended in the defeat of François at Pavia (1525), and the forfeiture of Sforza's possessions. Next year K. married Isabella, daughter of Emmanuel of Portugal. Clement VII. having formed a league against K., the Constable of Bourbon, who had held the French in check in Piedmont, sacked Rome, and took the Pope prisoner. The Peace of the Ladies at Cambrai (1529) brought a lull in hostilities, and K. was crowned at Bologna King of Lombardy and Emperor of the Romans. He at the same time restored the Sforza and the Medicis. In the meantime the Diet of Augsburg had led to the league of Schmalkalden, and the unity of the German empire was lost. The expedition against Suleiman II., who was assisting Zapolya against K.'s brother Ferdinand, and in support of Muley Hassem in Tunis, was followed by several campaigns on French territory without result; and the truce of Nices gave K. time to assert despotic authority in Spain, and to alter the constitution of the ancient Cortes. After the collapse of the Algiers expedition, the Emperor caused his son Philip to be recognised as King in Castile and Aragon. The Diet of Speyer (1544) furnished the means for another invasion of France, but when K. proceeded to put into execution the early decrees of the Council of Trent, the Protestant princes took the alarm and formed the Confederation, which was dissolved by the defection of Moritz of Hessen and Sachsen, and the victory of Muhlberg. François I. being now dead, the Emperor was able to devote himself to the forcible propagation of Catholic doctrine and the *Interim* of Augsburg, until the revolt of Moritz brought about a measure of toleration in the treaty of Passau (1552). The attempt to recover Metz, Toul, and Verdun having failed, and Philip being married to Mary Tudor, K., whose health was now broken, resigned the empire to Ferdinand on 25th October 1555, and the crown of Spain to Philip, 15th January 1556. On 24th February 1557 he entered the monastery of St. Just, near Placentia, where he remained till his death on 21st September 1558. Though he had fallen into a religious melancholy, he still retained his interest in politics, and was constantly 'advising' his son and others. In spite of the heavy taxes with which K. oppressed Spain, the Netherlands, Milan, Naples, Sicily, and the Spanish colonies in the New World, he left a large debt behind him, with instructions to his son to preserve the Catholic faith and to show no quarter to heretics. He showed great skill in dealing with the political equilibrium of Europe and with the religious passions of the Church and the Reform party, his main object being the aggrandisement of himself and his family. Robertson's *History* is still a leading English authority on his life and times. Sir William Stirling Maxwell's *Cloister Life* is also authoritative. Other works are Lanz, *Correspondenz des Kaisers K. V.*, Gachard, *Correspondence de Charles Quint;* Guntram, *Kaiser K. V.*, and Motley's *Rise of the Dutch Republic.*—**Karl VI.**, born 1st October 1685, the son of Leopold I., claimed the throne of Spain on the death of Karl II. (1st November 1700), who had, however, bequeathed it to his sister's grandson, Philippe of Anjou. K. prosecuted his claim most vigorously, carrying on the 'War of the Spanish Succession' from 1704 to 1711 in the heart of Spain itself. On his succeeding his brother Joseph I. as Emperor, his allies were unwilling to prolong the war, and made with France the Peace of Utrecht (1713), and by the Peace of Rastadt (1714) K. accepted the secure possession of Milan and Mantua, Naples, Sardinia, and the Netherlands. The next few years were occupied by the brilliant campaign of Prince Eugène of Savoy against the Turks, ending in the Peace of Passarowitz. K. next assured the succession of his daughter Maria-Theresa (he had no sons) by the Pragmatic Sanction. In 1733 Austria and Russia combined to support the claims of August III. to the Polish crown. This 'Polish Succession' war cost K. the Two Sicilies and a part of Milan: it was, however, successful in its immediate object, though ultimately disastrous to Poland. His war with the Turks, ending with the Peace of Belgrade (1739), further diminished his possessions on the E. frontier. K. executed a great number of public works, and, had his reign been peaceful, might have greatly advanced his country, though his attachment to the ecclesiastical orders and a feudal aristocracy was somewhat blind. He died 20th October 1740. See Förster, *Die Höfe und Cabinete Europas im 18 Jahrh.*—**Karl VII.**, born 6th August 1697 at Brussels, son of Maximilian-Emmanuel, Elector of Bavaria, was first governor of the Netherlands, then served in the Turkish war, and succeeded his father in 1726. He married Maria Emilia, a daughter of Joseph I., and on the death of Karl VI. he claimed the imperial crown as descended from Anna, the daughter of Ferdinand I., and in terms of the will of Ferdinand. Allying himself with France and Spain, he marched on Linz and Prag, and was unanimously elected Emperor in 1742. The troops of Maria-Theresa then occupied Bavaria and Bohemia, and drove K. to Frankfurt. After the victories of Friedrich the Great and Seckendorf he returned to Munich, where he died 20th January 1745.

Kings of Sweden.—**K. IX.**, the youngest son of Gustaf Vasa, after acting for several years as regent for his nephew, Sigismund of Poland, succeeded to the throne in 1599 after the defeat of the Polish forces at Stängelro. K. had already, as leader of the Protestants in the reign of his brother Johann and in supporting the resolutions of Upsala (1593), helped to make Sweden a Protestant country, and he now treated the Catholic nobility who desired an elective monarchy with severity. His admission of burghers and peasants to definite political rights and his care for trade brought him the title of the Peasant King (Bondarkonungen). He conducted against Denmark the Kalmar war, which arose out of conflicting claims to the Riga trade, intervened in Russian politics during the rebellion of Demetrius, and actively urged the formation of a Protestant union in Europe. He died, aged sixty, at Nyköping in 1611, leaving as his successor the heroic Gustaf Adolf, a son by his second wife, Christina of Holstein-Gottorp.—**K. X. Gustaf**, a nephew of Gustaf Adolf, succeeded to the throne of Sweden on the abdication of his cousin Christina in 1654. His short reign was full of wars. He defeated the Poles at Warsaw in 1656, obtained from Denmark by the Peace of Roeskilde (1658) the provinces of Skaania, Halland and Bleking, and was only driven from the Kattegat by the intervention of the English and Dutch. He died in 1660, aged thirty-eight. His father being the Count Palatine Johan Kasimir, K. and his descendants have been called the Palatinate dynasty.—**K. XI.**, the infant son of the preceding, succeeded, but from 1660 to 1675 the country was misgoverned by a council of regency appointed by the will of the late king. Peace was negotiated with Russia and the Polish King John Kasimir, but when in 1674 an expedition in aid of the French was undertaken against the Elector of Brandenburg, and when in the following year Denmark and Holland declared war against Sweden, K. found in the defeats of Fehrbellin and Oland that the council had entirely neglected both army and navy. The war continued till the Peace of St. Germains (1679), when K. recovered the territory of Pommern and married the Danish Princess Ulrika Eleanore. With the help of Gillenstjerna K. now addressed himself to internal finance. By claiming a large sum of wrongful appropriations from former ministers, and by the right of 'reduction' or retaking of crown lands granted out within the preceding thirty years, he saved the state from bankruptcy. In doing so he came into conflict with the noble grantees and with the national estates, which body he forced in 1693 to acknowledge his sovereignty as absolute. K. was ignorant, but energetic, and popular with the poor. He died, aged forty-two, in 1697, and was succeeded by his eldest son **K. XII.**, who, at the age of fifteen, being declared major by the estates, crowned himself without taking any oath of fidelity. His youth gave little promise of his subsequent distinction, and accordingly in 1700 Frederik IV. of Denmark and Augustus of Poland (who had entered into a treaty with the Czar Peter) took this opportunity of attacking Holstein-Gottorp and Livonia. Procuring some vessels from the English king, K. showed his military genius by an immediate bombardment of Copenhagen, and, imposing his terms on Frederik, next marched to the relief of Riga and to Narva in Ingermannland, where on 30th November 1700 he defeated 60,000 Russians under De Croy with a force of 8000 Swedes. K. then advanced into Poland, stormed Warsaw, compelled Augustus after the battles of Klissov and Pultusk to resign, and secured the election in 1704 of Stanislas Lesczinski, the young Voivod of Posen. For six years K. remained in

Poland and Sachsen, his influence being so great that at his request Joseph I. granted liberty of conscience to the Silesian Protestants. The designs of the Czar on Ingermannland and Livonia recalled K. to Russia in 1707. Dissuaded by the Cossack Ivan Mazeppa from a projected attack on Moscow, he turned S. to the Ukraine, and after a severe winter in camp was completely defeated at Pultava on 27th June 1709, the Cossacks having deserted, and a wound preventing him from commanding in person. This was the signal for attack on Sweden, and, while General Stenbock and his army of 'wooden shoes' was engaged with the Danes, whom they drove out of Skaania, the Russians took possession of parts of Esthonia and Livonia. K., who had escaped to Turkey, persuaded Achmed III. to make war on the Czar, but soon found himself a prisoner of the Porte at Dimotika. From this he escaped in 1714, rode across Europe in fourteen days under the assumed name of Peter Frisch, and threw himself into Stralsund, which he defended against the united Russians, Saxons, and Danes. With the help of his minister Görtz K. now energetically recruited his army, Lund being the headquarters; but just as an alliance with Russia and Spain was being completed, the 'Demürbasch' (Ironhead), as the Turks called K., was shot in the trenches before Frederikshald on 11th December 1718. His life has been written in almost every European tongue. His simple life and manner, his bravery, his brilliant success and tragic reverses, endeared him to his people, who recall with pride the 'Karolinska tiden' (Karl's time). K.'s chaplain, Norberg, wrote the Biography of his master; Adlerberg published memorials of his military career; Voltaire's *Histoire de Charles XII.* has (or had) a European fame, but the most authoritative work is Lundblad's *Konung Carls XII. Historia* (Stockh. 2 vols. 1830; Ger. transl. Hamb. 2 vols. 1835-40).—**K. XIII**, born at Stockholm 7th October 1748, the son of Adolf Fredrik, King of Sweden, and Louise Ulrike, the sister of Friedrich the Great, had distinguished himself in the naval war of his brother Gustaf III. against Russia, and had, as Duke of Sodermanland, been chosen as regent in 1792, when his French proclivities and the arrogance of his minister Reuterholm gave dissatisfaction. In 1809, when the eccentric Gustaf IV. was declared to have forfeited the crown, K. was elected king, the Diet being at the same reorganised on a constitutional basis. Owing to the generalship of Bernadotte, who on the death of Prince Christian August of Augustenborg in 1809, had been chosen Crown Prince, K. became in 1814, King of Sweden and Norway, the two Diets, the Riksdag and the Storthing, remaining distinct. K. died on 5th February 1818.—**K. XIV.**, originally Jean Baptiste Jules Bernadotte, made by Napoleon Prince of Porte-Corvo, but called by the Swedes K. Johan, was born at Pau, 26th January 1764. Although a brilliant general, he had, through his firmness in resisting Napoleon's ambition in 1799, never enjoyed his master's confidence. Suspicion followed him to Sweden, where Napoleon, relying on the Treaty of Paris, treated him with great indignity and forced him into the Continental Alliance. K., however, kept up trade with England, and took advantage of the seizure of Pomerania to declare war against France in 1812, and at Grossbeeren and Dennewitz contributed decisive victories to the cause of the allies. Sweden had lost Finland and Aaland to Russia in 1809, and at the Congress of Vienna Pomerania was ceded to Prussia for a sum in money, but under the vigorous rule of the 'burgher-king,' she rapidly developed her trade, threw off a large public debt, and supplied herself with a good system of education and of internal communication. Although K. had adopted the national religion, he could not learn the language; and towards the close of his reign his persecution of liberal writers and his decided preference for aristocratic interests destroyed his popularity. The names of Berzelius (chemist), Geyer (historian), Tegnér (poet), Fogelberg (sculptor), show the advance of Sweden during this reign. K. died 8th March 1844 and was succeeded by his son Oscar.—**K. XV.**, the eldest son of Oscar I. and Josephine of Leuchtenberg, granddaughter of the French empress Josephine, succeeded to the united crown on his father's death in 1859. From 1857 he had carried on the administration as regent. K. extended the railway system and conciliated the Norwegians, who were jealous of the predominance of Swedish interests. In 1866 he introduced the present constitution of the Diet, viz., a chamber of members chosen for nine years by the provincial Landsthings, and a chamber of members chosen by universal suffrage to decide special questions. K. died in 1872, and was succeeded by his brother Oscar II. His daughter Lovisa (Louisa) is wife of the present Crown Prince of Denmark.

Karl, Ludwig, Archduke of Austria, born 5th September 1771, a son of Leopold II., and younger brother of Franz II., first showed his military genius in 1793. He became Governor of the Low Countries, and in 1796-97, as Commander-in-Chief of the Austrian and Imperial armies, he drove back Moreau and Jourdan beyond the Rhine and captured Kehl. After the Congress of Rastadt, he took the field against Jourdan in Suabia, and was opposed to Massena in Switzerland. He subsequently became Governor-General of Bohemia, and Minister of War, the Treaty of Luneville being adjusted by him. In 1805 he again confronted Massena in Italy, while Napoleon pushed on by Ulm to Austerlitz. After the Peace of Presburg, K. was appointed Chief of the Aulic Council of War and Generalissimo of the Austrian forces. In the great battles of 1809—Eckmühl, Aspern, and Wagram—although constantly worsted by the genius of Napoleon and his brilliant staff of generals, K. showed great coolness and determination. This was his last campaign. K. lived till 30th April 1847. He wrote *Strategics*, and a *History of the Campaign of 1799*.

Karl Martel, a natural son of Pippin of Herstall, was born about 690 A.D., and was in prison at Metz when his father died, 16th December 714, leaving to an infant grandson Theodebald, the office of Mayor of the Palace. The wars which ensued between Neustria (Chilperich [Hilperik] II., the King, and Raganfried, the mayor, had formed a league with the Frisians) and Austrasia soon brought K., whose bravery was known, to the head of the Austrasian armies, which he led to conquest at Vincy near Cambrai in 717. He was then made Duke of the Austrasian Franks at Koln, and Hlothar IV. was declared king. The mission of Boniface tended to strengthen K. on his Saxon frontiers, while in spite of the help given by Odo (Eudes) of Aquitania the Neustrian mayor was again defeated at Soissons. Hlothar then died, and K. arranged that Chilperich should be nominal king of both divisions of France, and himself mayor in both. On the death of Chilperich, K. chose as king Theoderich, a boy six years old. Like the other 'Do-nothing kings' Theoderich lived without influence (720-37). During that period K. led six expeditions to the N. and E.; the Germans, Bavarians, and Frisians submitted, but as K. built no fortresses, and could not therefore leave garrisons, the Saxons maintained their independence. In the meantime the generals of the Ommiad Calif Hashem had established themselves at Narbonne, and by repeated expeditions driven back the Aquitanians on the Loire. In 732 K. met the Saracen army near Poitiers, and decisively checked its farther advance; the name *Martel* ('hammer'), however, was given him by chroniclers long subsequently. After campaigns in Frisia and against the independent nobility of Burgundy and Provence, K. in 737 retook Avignon from the Saracens, and besieged for some time Narbonne itself, then commanded by Abd-el-rahman, and in retreating set fire to Nismes. In this year Theoderich died. It is remarkable that K., while he retained in his person the military command, the administration of justice, the arrangement of provincial affairs, &c., did not think it necessary to confine Theoderich to the palace, but permitted him to move about freely with his court. The help of the Lombards, and the dissensions of Abd-el-Melek and Offa in Spain, which resulted in the separation of the Cordovan Emirate from the Califate of Bagdad, at last brought about comparative quiet on the S. frontier. K. rewarded his victorious army with Church lands, for which in 858 the French clergy, in asking Hludwig the German to restore the property, decided that their saviour from the Moslem power was condemned to eternal torture not merely for his own sins, but for the sins of those who had endowed the Church. In 741 Pope Gregory III., who had quarrelled with the Emperor Leo on the image-worship question, and had interfered between the Lombards and the Duke of Spoleto, sought K.'s protection against the former. The matter was amicably arranged, and on the 21st October of the same year K. died at Quiercy near Compiegne, leaving to his son Karlmann, Austrasia with Suabia and Thuringia, and to Pippin, Neustria, Burgundy, and Provence. See Breysig's *Karl Martell* (1869), and Kitchen's *History of France* (Lond. 1873).

Karlsbad ('Karls' bath'), a celebrated watering-place of Bohemia, in the pine-clad valley of the Tepel, a tributary of the

Eger, 76 miles W.N.W. of Prag by rail. The springs, according to a tradition, were discovered by Karl IV. in 1347. They have a maximum temperature of 167° F., and gush forth with violence from apertures in the hard rock (*Sprundelschale*) on which the most of the town is built. The oldest, hottest, and most copious spring is the Sprundel, which rises in a volume 1½ feet in diameter to a height of 3 feet (formerly 6 feet). Especially efficacious in liver complaints, the waters chiefly contain sulphur, salt, and carbonate of soda. About two million gallons are discharged daily. There were 18,000 visitors in 1872. K. has a theatre and many fine hotels, reading-rooms, and cafés. Goethe frequently resided here. Pop. (1869) 7291.

Karls'burg or **Belgrad** (formerly *Weissenburg*, Magyar *Károly-fejérvár* or *Gyulaj*), a fortified town of Transylvania, Hungary, on the river Maros, 58 miles by rail N.W. of Hermannstadt, named after Karl VI., and built on the site of the ancient *Apulum*, is a bishop's see, has a cathedral with the tombs of the Hunyads, an observatory, and a mint. There is a large wine-trade. Pop. (1869) 7955.

Karlskro'na, or **Ble'king**, a län of Göthaland in Sweden, surrounded by Christianstad, Kronoberg, Kalmar, and the Baltic Sea, has a rocky surface with extensive woods and many lakes. Except from 1332 to 1360, K. belonged to Denmark till 1658. Area, 1164 sq. miles; pop. (1876) 131,812.—K., the chief town, is the main station and arsenal of the Swedish fleet, was founded by Karl XI. in 1680, and lies 240 miles S.W. of Stockholm on several rocky islets connected by bridges. Its excellent harbour is strongly defended by the forts Kungsholm and Drottningsskär, and has docks cut out of granite, covering 20,580 sq. yards. K. has a sailors' hospital, schools of navigation and shipbuilding, and many naval workshops and stores. Tobacco and sugar are manufactured. Pop. (1876) 16,877.

Karls'ruhe, capital of the Grand-Duchy of Baden, S. Germany, 45 miles N.E. of Strassburg, and 3 miles from the right bank of the Rhine, is a regularly-built town, with streets stretching out from the Schloss (founded about 1750) like the ribs of a fan, and divided by the 'Lange Strasse' into a northern and southern part. K. was founded in 1715 by the Markgraf Karl III., and has a polytechnic school, an observatory, a botanic garden, a library of 100,000 volumes, and rich art-collections. There are extensive manufactures of machinery, carriages, furniture, and jewellery. Pop. (1875) 42,768.

Karl'stad, a town of Sweden, in the län of Wermland, is situated on the island of Tingvalla, on the N. side of the Wener Lake, 160 miles W. of Stockholm by rail. It is connected with the mainland by two bridges, one of which is the longest and finest stone bridge in Sweden. K. is the seat of a bishop, and has an important haven, a beautiful cathedral, a gymnasium, an observatory, a theatre, &c. It exports copper, iron, and timber through the Gotha Canal. Pop. (1874) 5433. K. was founded by Karl IX. in 1548.

Karl'stadt, a fortified town of Austria, in Croatia, on the Kulpa, and 33 miles S.W. of Agram by rail. It has an old castle with a large armoury, and is a busy commercial place. Pop. (1869) 5175.

Karma'thians, a Mohammedan sect founded in Persia about 900 A.D. by Abu Said Al-Karmata, an Ismaelite missionary who mastered Irak, Syria, and a great part of Arabia, but was assassinated in 914. Under his son and successor, Abu Tahir, the K. attacked Mecca (930), butchered the pilgrims, profaned the Kaaba (q. v.), and carried off the Black Stone to Lahsa, their capital, where it remained for twenty years. Abu Tahir died in 943, and thenceforth the power of the K. declined. They were defeated at Kufa in 986, and again in 989, but retained Lahsa until 1041, and remnants of them, according to Palgrave, still linger on at Hasa. Their tenets seem to have been identical with those of Ismaelitism, without the foreign elements of the latter; to have been, in short, a free-thinking form of Islam. Wine was allowed, and prayer, fasting, and other observances of the older law were treated esoterically. See Palgrave, *Central and Eastern Arabia* (2 vols. 1865.)

Kar'olings (sons, *i.e.*, descendants of Karl) were members of the second dynasty of Frankish kings. Their lineage may be traced to Pippin of Herstall, who after the battle of Testri (687), as Mayor of the Palace and Duke of the Franks, practically superseded the Merwings, though he did not dethrone them. It was not until 753, however, that Pippin, the son of Karl Martel, was actually elected and crowned king at Soissons. In 768 his kingdom passed to Karl and Karlmann, the former upon his brother's death extending his dominions from the Atlantic to the Lower Vistula, and accepting at the hands of Pope Leo III. the title of Emperor of the Romans. At Aachen (in 813) Hludwig the Pious was crowned as his father's successor, but (in 817) he voluntarily divided the empire among his sons Lothar, Pippin, and Hludwig, afterwards (829) making a new kingdom for his son Karl by a second marriage. After much fighting a final division of the empire was made, Lotharingia falling to Lothar and Karolingia to Karl, whilst Hludwig received the Teutonic kingdom which became Germany. Under Karl the Fat, the son of Hludwig the German, the empire was again united until 887, when, owing to his incompetence, he was dethroned at Tribur. Arnulf, his illegitimate nephew, was next successor, and Hludwig the Child came after. With him (910) ended the Karolingian dynasty in Germany. Odo (Eudes), Count of Paris, was elected king of Karolingia, and 'there followed about a hundred years of shifting to and fro between his new family and the old family of the K.' Hludwig V., the last Karolingian king, died at Laon (987), and 'this was the real beginning of the modern kingdom of France.' See Bryce's *Holy Roman Empire* (1875); Freeman's *General Sketch;* Maine's *Ancient Law* (1861).

Kar'oly, or **Nagy-Ka'roly** (*Hirsch*), a town in the comitat of Czathmár, Hungary, 200 miles E. by N. of Pesth, with which it is connected by rail. K. has linen and woollen weaving, and the fertile neighbourhood produces much wine, maize, and tobacco. Pop. (1875) 12,754.

Karr, Jean-Baptiste-Alphonse, a French writer, born at Paris, November 24, 1808, studied at and became a teacher in the Collége Bourbon, and published his first novel, *Sous les Tilleuls*, in 1832. Others followed in quick succession, and in 1839 he became editor-in-chief of *Figaro*, the same year starting the monthly *Les Guêpes*, which had a great success. He was made Chevalier of the Légion d'Honneur in 1845, but after the revolution of 1848, being defeated in the Seine Inférieure elections, withdrew to Nice, where he has continued to write for the *Revue des Deux Mondes* and other journals. Of his thirty or forty works the best known are *Voyage autour de mon Jardin* (1845), and *Promenades hors de mon Jardin* (1857). They abound in terse, incisive observations, and witty criticisms of society. The *Esprit d'A. Karr: Pensées extraites de ses Œuvres Complètes* appeared in 1877.

Karroo' (a Hottentot word signifying 'dry or barren') is a term applied in Cape Colony primarily to the barren plateaux lying between the Nieuwveld, Roggeveld, Langeberg, and Zwarteberg ranges, and thence to barren plains generally. The soil of the K. consists of shallow but fertile deposits of red clay on a substratum of blue schistose slate. It is in many parts impregnated with saline matter, but when irrigated produces good crops. The Great K. is about 3000 feet above the sea-level, and the Little K., or Kannaland, 1000 feet lower. Both are subject to great extremes of temperature. They have evidently at one time formed the beds of lakes, and abound in fossil saurian remains peculiar to this region. Large flocks of sheep are now pastured on the K., and the value of land there has quintupled within the last few years.

Kars, a fortified town, formerly in the vilayet of Erzerum, Asiatic Turkey, but now (1878) within the territory ceded to Russia, lies on a tributary of the Aras, 6000 feet above the sea, and 110 miles E.N.E. of Erzerum. There are two isolated and walled suburbs, containing over a third of the inhabitants. The town is defended by a massive old castle, perched on a precipitous rock. It is the eastern key to Asia Minor, and has an extensive transit trade. In 1828 it was taken by the Russians under Mouravieff, was defended during the Crimean War by a Turkish garrison, 17,000 strong, under the command of General Williams, till famine compelled its surrender, November 30, 1855, and was again taken by the Russians, November 19, 1877, after a brief siege, the Turkish army of Armenia, under Mukhtar Pasha, having been utterly crushed at the Aladja Dagh in the previous month. Pop. 12,000. K. was part of the famous Turkish quadrilateral in Asia Minor (composed of K., Erzerum, Batoum,

and Ardahan), but one result of the war of 1877-78 has been to transfer these fortresses (with the exception of Erzerum) to Russia.

Kar'shi (anc. *Nakhsheb*), the second most important town in the khanat of Bokhára, Central Asia, 90 miles S.E. of the town of that name, has an extensive transit trade with India, and Kábul, and Bokhára. Its pop., 25,000, chiefly Usbeks, supply the best of the Bokharian soldiers, and its knives and swords are in great request through all Asia. There are Russian cantonments here.

Karwar', a seaport in the district of N. Canara, Bombay, British India, at the mouth of a stream called Konai, 300 miles S. from Bombay. Pop. (1873) 13,263. Here is shipped the cotton of Dharwar and the S. Mahratta country. A state railway has been sanctioned to Hubli, and it is proposed to protect the harbour by throwing out a granite breakwater for a mile and a half. There is at present safe anchorage during the S.W. monsoon.

Kasan', or **Kazan'** (Tartar, 'kettle') a government of E. Russia, surrounded by the governments Viatka, Ufá, Simbirsk, and Nishegorod. The area, 24,600 sq. miles, mainly consists of a well cultivated, undulating plain (two-fifths covered with wood) drained by the Volga, with its affluents the Kama, Kasanka, &c., broken, however, in the E. by offshoots from the Ural Mountains. K. is subject to great extremes of temperature. Tillage and cattle-rearing are the chief industries. Pop. (1870) 1,670,337, chiefly Russians, with 400,000 Tartars and other Asiatics. The Khanat of K., which arose about the end of the 14th c., on Timur's conquest of the Kiptshak kingdom, covered the present governments of K., Simbirsk, Pensa, Viatka and Perm; its rulers constantly warred with the Russian grand-dukes, till vanquished by Ivan I. in 1487, and finally subdued by Ivan II. in 1552.—K., the chief town, near the junction of the Volga and Kasanka, 205 miles E. of Nishnij-Novgorod, is the seat of a metropolitan bishop, has a cathedral, a university, and thirty-eight churches, manufactures leather, hardware, soap, cloth, and cotton, and has a large trade with Siberia. Pop. (1870) 78,602 (one-fourth Mahommedans). See E. T. Turnerelli's *Kazan, the Ancient Capital of the Tartar Khans* (2 vols. Lond. 1854); Latham's *Native Races of Russia* (Lond. 1854).

Kasanlik', a town of Turkey, in the vilayet of Adrianople, at the entrance to the Balkan Pass, 85 miles N.W. of Adrianople. It lies in a fertile and well-irrigated plain, and produces fine attar of roses (5000 lbs. of blossoming rose-leaves yielding 1 lb. of perfume, valued at about £18), walnuts (£19,995 worth yearly), and beautiful walnut timber. Pop. 10,000.

Kaschau' (*Kassa*), the principal town in the N.E. of Hungary, in Abujvar, on the right bank of the Hernád, 130 miles N.E. of Pesth by rail. It is the seat of a bishop, and has forty-one Roman Catholic churches, one Protestant, and one Greek church, a Government academy, with a library, an important seminary, and a theatre. The cathedral of St. Elizabeth is a beautiful Gothic building, with a tower of the 13th c., and twenty-seven altars. K. has fayence, paper, and tobacco industries, and a considerable trade in wine, grain, and tobacco. Pop. (1869) 21,742.

Kashan', a town of Persia, in Irak Ajami, on a stony plain fringing the great salt desert, 128 miles S. of Teheran. It is girt by feeble walls, and embowered in mulberry groves; its finest building is the *medresh* or college built by the Shah. K. is a great industrial centre. It supplies all Persia with copper wares (perforated lanterns, ingenious portable cooking utensils, &c.), which are generally tinned and whitened so as to resemble silver. Its flowered silks (*shal kashai*) are exquisite imitations of the richest Cashmere shawls. Other noted manufactures are cotton-stuffs and velvets. Pop. 30,000.

Kashgar'. See CASHGAR.

Kashin', a town in the government of Tver, Russia, on the Kashinka, an affluent of the Volga, 74 miles N.E. of Tver, with trade in provisions and linen, large annual fairs, and manufactures of paper, leather, sacks, and hosiery. K. has twenty-eight churches. Pop. (1870) 7516.

Kass'el, formerly capital of the electorate of Hessen, and now seat of the government of the Prussian province of Hessen-Nassau on the Fulda, 85 miles S. of Hanover by rail. The Fulda separates the Altstadt and Ober-Neustadt from the Unter-Neustadt, and is crossed by two bridges. The Great Friedrichs-Platz is enclosed on the E. by the Old Palace of the Electors; the New Palace and the Museum (erected by the Landgraf Friedrich II. in 1779), and on the W. by stately dwelling-houses. Other notable buildings are the Protestant church of St. Martin, in Gothic style, with nave of the 14th c., restored in 1842; the Bellevue-Schloss, containing a celebrated picture-gallery, founded by Prince Wilhelm of Hessen at the beginning of the 18th c., and which is specially rich in Dutch and Flemish works; an observatory, two hospitals, an opera-house, two theatres, &c. The collection in the Museum Fridericianum was begun by the Hessen princes at the close of the 16th c., and comprises ancient sculptures, Roman and Florentine mosaics, curious clocks, art objects in ivory, gold, silver, and agate, a natural history section, armoury, a library of 200,000 vols., &c. The Auegarten, or Karlsaue, by the river side, beautifully laid out by Le Nôtre in 1709, is the favourite resort of the inhabitants. K. has some manufacture of cottons, woollens, silks, lace, carpets, scientific instruments, &c. Pop. (1875) 53,043. The town appears as *Chassala* in the rolls of Konrad I., as early as 913. It received freedom and privileges in 1239. After the Peace of Tilsit, 1807, K. was made the capital of Westphalia. Distant nearly 4 miles is Wilhelmshohe, formerly the residence of the Elector of Hessen, and celebrated for its beautiful grounds and fountains. Napoleon III. was a prisoner here during the latter part of the Franco-Prussian war in 1870-71. See Lynker's *K. und die schonsten Punkte der Umgegend* (4th ed. Kass. 1856).

Kassimof' (formerly *Gorodez*), a town of Russia, in the government of Riazan, 69 miles N.E. of the town of that name, on the Oka. It has a large yearly fair, extensive tow and leather manufactures, and there are numerous glass-furnaces in the neighbourhood. Pop. (1870) 14,102.

Kastamu'ni, a town of Asia Minor, the capital of a vilayet of the same name, on the Gök Irmak ('blue river'), 113 miles N.E. of Angora. It is a decayed place, with trifling manufactures of copper, leather, and cotton. Estimated pop. 40,000.—The *vilayet* of K. has an area of 20,400 sq. miles, and a pop. (according to the *Almanach de Gotha*, 1877) of 772,010.

Ka'ter, Captain Henry, F.R.S., was born at Bristol, April 16, 1777. In 1794 he obtained a commission in the 12th regiment of foot, then stationed in India, where in the succeeding year he aided in the trigonometrical survey of that country. After seven years' stay he was obliged through ill health to return to England. In 1814 he retired upon half pay, and devoted the remainder of his life to science. He died at London, April 26, 1835. K. is best known for his invaluable experiments to determine the length of the seconds' pendulum, and for his labours in constructing standards of weights and measures. He was a member of most of the scientific societies at home and abroad, and was presented by the Czar of Russia with the order of St. Anne and a diamond snuffbox for his services in relation to the Russian standards of weights and measures.

Kat'rine, Loch, a beautiful lake of the Scottish Highlands, near the S.W. border of Perthshire. It is 8 miles long and about three-quarters of a mile broad, is approached from the E. by the romantic defile of the Trossachs, and is overshadowed on the S. by the riven mass of Ben Venue. The splendid scenery of the region is minutely described in Scott's *Lady of the Lake*. L. K. supplies Glasgow with water, which is conveyed through the mountain side by a tunnel 6975 feet long, and subsequently by aqueducts and pipes for a distance of 25 miles.

Kat River, a tributary of the Great Fish River, Cape Colony. An interesting Hottentot settlement was formed in its upper valleys in 1829, but was broken up after the Hottentot rebellion of 1851-52.—The *district* is now included in that of Stockenström. It is mountainous, well wooded, and fertile. Pop. 5700 of all races, including many Europeans.

Kattamándu, or **Cattemundoo**, the East Indian name for the inspissated juice of one or more species of *Euphorbia*. It is a substance analogous to gutta-percha, and is used in India for cementing metal surfaces.

Kattywar' (Kathiawar), the name of a district in India, derived from the dominant tribe of Katties, said to be of Scythian origin, which has been politically extended to the whole peninsula of Gujerat, lying N.E. of Bombay between the Runn of Kutch and the Gulf of Cambay. Area, 22,339 sq. miles; pop. (1872) 2,312,629. It is well watered by rivers rising in the central plateau, and carries on a brisk trade in cotton, wool,

grain, hides, &c. The export of cotton in 1874-75 was valued at £2,500,000. The breed of horses is famous; and lions, said to be black and maneless, here alone in India take the place of tigers. K. is divided into four *pranths* or counties, each under a European official, and there are more than 200 petty chiefs subordinate to the K. Political Agency. Many of these are tributary to the Gaekwar of Baroda. The administration has been greatly improved of late years; and the ancient state of internal anarchy has now ceased. A railway was opened in 1872 in the N. of this tract. The English headquarters is Rajkote, where there is a public school for the young chiefs. Among historical sites are the hill of Girnar (q. v.) and the temple of Somnauth (q. v.). The chiefs are mostly Rajputs, and in former days they were infamous for the practice of female infanticide. The leading principalities are Jhownuggur, Nowanuggur, and Bhownuggur. See Wyllie's *Essays*, ed. by W. W. Hunter (Lond. 1875).

Katun'ga, or **Ejeo**, a town in the Fellata territory, W. Africa, 220 miles N.E. of Abomey, has a lively trade in grain, sheep, cloth, &c. Estimated pop. 16,000.

Katz'bach, a river of Prussian Silesia, on whose banks at Wahlstatt (the scene of a Tartar defeat in 1241) was fought the battle of K., August 26, 1813, between 100,000 French under Macdonald and 90,000 Germans under Blücher. The latter had drawn Macdonald across the K. and Neisse, only to drive him back into their waters, swollen by rain, which had also damped the powder, so that the battle was one of bayonet and butt-end. When the floods went down, thousands of French corpses were seen sticking in the mud. The total loss on the side of the French was 18,000 prisoners, 12,000 dead and wounded, 2 eagles, and 103 guns; on that of the Germans, only 1000 men. Blücher received the title Prince of Wahlstatt, and Macdonald, returning almost alone to Dresden, announced to Napoleon, 'Your army of the Bober no longer exists.'

Kauff'mann, Angelica, a well-known painter, born October 30, 1741, at Chur in the Grisons, received her first instruction from her father, and after twelve years' study in Italy came to London (1765), where she achieved a brilliant success, painting the portraits of the royal family, and being elected one of the thirty-six original members of the Royal Academy. A marriage with a Swedish adventurer, the *soi-disant* Comte de Horn, was followed by a separation (1768), and in 1781 Angelica married a landscape-painter, Antonio Zucchi, who had followed her from Venice. Returning to Italy the year after, she there lost both husband and fortune (1795), and died at Rome, November 5, 1807. Her pictures—graceful but feeble allegories, often introducing her own beautiful portrait—abound in all the galleries of Europe; and a fresh interest has lately been lent to her history by its forming the basis of a charming fiction by Miss Thackeray—*Miss Angel* (Lond. 1875).

Kauf'mann, K., Von, a distinguished Russian general of German descent, was educated at the Military School for Engineers, served with brilliant success in the Caucasus, acquiring the rank of general and the post of chief of the field officers under Mouravieff. During the Crimean War he was chosen to settle with General Williams the conditions for the capitulation of Kars. He was successively appointed chief of the staff of the Grand Duke Nicholas, Minister of War, and Governor of Lithuania *vice* General Mouravieff, in 1865. To K. and Millutin is due the credit of entirely re-organising the army. In 1867 K. was nominated Governor-General of the vast Asiatic territories of the Sír Daría and Semivetshkaia. After long negotiations with the refractory Emír of Bokhára, K. defeated the forces sent against him, and concluded a treaty (1868) by which Samarcand and a large territory was ceded to Russia. In 1873 followed the taking of Khiva, K.'s masterpiece of generalship. Surrounded on all sides by immense deserts, Khiva was approached by three columns, comprising 12,000 men, from the Caspian, from Orenburg, and from Tashkend, the last of these being under his own command. The troops were skilfully extricated from the hardships of their terrible march, and Khiva was taken on the 10th June 1873. In consequence of a treaty between Russia and England the army was withdrawn from Khiva, but the campaign greatly extended Russian dominion, and established the unconditional authority of Russia in Central Asia. Tashkend is K.'s residence. His last act was the invasion and conquest of Khokan in 1875.

Kaul'bach, Wilhelm Von, was born in 1804, at Arolsen, capital of the principality of Waldeck. Without exhibiting any particular leanings towards art in his youth, K. was entered at the Academy of Dusseldorf, and set to work at some frescoes of Cornelius. In 1825 he followed Cornelius to Munich, where he executed 'Apollo and the Muses' for the ceiling of a concert-hall, and worked at the story of Psyche upon the walls of the Prince of Birckenfeld's palace. His 'Victory of Herman over the Romans,' and 'The House of Fools,' gave him a European reputation which was more than sustained by the 'Combat of Souls,' the 'Destruction of Jerusalem by Titus,' and the historical tableaux composed (1847-66) for the decoration of the staircase of the Berlin Museum. K. has been blamed for an absence of warmth in colouring, and a certain frigidity in execution, but universal admiration has been bestowed upon his imaginative power, his mastery over various expressions, and the depth of his general conceptions. K. died April 7, 1874.

Kau'nitz, Wenzel Anton, Prince Von, the youngest son of Maximilian Ulric, Graf von Rietberg, was born at Vienna, February 2, 1711. At first destined for the Church, on the death of his brother he embraced a diplomatic career, attended the universities of Vienna, Leipsic, and Leyden, and from 1732 to 1735 travelled in Germany, Italy, France, and England. Under Karl VI. he acted as second imperial commissioner at the Diet of Ratisbon. Under Maria Theresa, in 1741, he executed a great mission at Florence, in 1742 acted as Minister at Turin, in 1744 Plenipotentiary to the Netherlands, in 1747 Ambassador to the Congress of Aix-la-Chapelle, and in 1750 Ambassador to the Court of France. Franz I. created him a feudatory Prince of the Empire, but his influence declined under Joseph II. until (1790-92) he was replaced at the head of the state by Leopold II. K. died June 24, 1794. *Le cocher de l'Europe* was a familiar phrase used regarding K. by his contemporaries, to indicate the fact that he wielded the reins of universal statesmanship. His devotion to the House of Austria rather than the empire to which he belonged narrowed his views, though these were always applied with energy and skill. To profound political knowledge, K. added the graces of an extensive literary culture.

Kau'ri, sometimes erroneously written **Cow'rie** and **Cow'die**, the native name of the pine *Dammara Australis*, found only in New Zealand, N. of the parallel of 37° S. lat. The K. is a noble tree, sometimes reaching a height of 140 feet, with an average girth of 10 to 15 feet, though Laslett (*Timber and Timber Trees*) mentions having seen two specimens whose circumference was 48 and 72 feet respectively. The timber of the K. is straw-coloured, close grained, and readily worked, and it combines the qualities of strength, elasticity, lightness, and durability to a degree entitling it to a place in the first rank among timbers. For masts and spars especially the K. is unrivalled. With regard to the resin which exudes from the K. see DAMMAR.

Kaye, Sir John William, the distinguished chronicler of various epochs in the history of the British rule in India, was born in London in 1814. In 1822 he passed from Addiscombe into the Bengal Artillery, but resigned military service for literary pursuits in 1841. He founded the *Calcutta Review*; and eventually entered the Home Service, and filled the appointment of Secretary in the Secret and Political Department of the India Office from 1859 to 1874. K. died 24th July 1876. Among his works may be mentioned *The History of the War in Afghanistan*; *The History of the Sepoy War in India*, of which he lived to publish only the third volume, out of a promised four; and *The Life and Correspondence of Sir John Malcolm*. His peculiar merit is to have used his official and private sources of information so as to popularise among Englishmen the great events and leading heroes of Indian history.

Kazaly, a Russian town and fort in Turkestan, and on the Sír-Daría (anc. *Jaxartes*) 40 miles from its mouth. It is the first of the forts on the so-called 'line of the Sír-Daría,' and was founded in 1847. The earthworks of the fort, which is garrisoned by 1000 men, are 200 yards square, surrounded by a ditch. Between the fort and river is the navy yard, and on the land side is the thriving town of K. with a pop. of over 5000. There is here a Cossack colony, and the chief products are cotton and a wine of excellent quality.

Kazan′. See KASAN.

Kean, Edmund, tragedian, born in London, November 4, 1787. The son of an actress, he figured as Cupid in a ballet as soon as he could stand, and became when very young a strolling player. His *debut* as Shylock at Drury Lane on January 26, 1814, was, according to Hazlitt, the 'first gleam of genius breaking athwart the gloom of the stage.' Densely packed houses for many seasons were inspired and terrified by his Richard, Othello, and Macbeth. The awful realism of his Sir Giles Overreach on one occasion sent an entire house into hysterics, Lord Byron into a convulsive fit. His fame spread with his travels, and for twenty years he was the dramatic meteor both of England and America. Dissipation at length ruined his powers and health. He died 15th May 1833. K. had marvellous powers of expression, and was the most intense depicter of the passions that ever trod the English stage. See Memoirs by Proctor (1835) and by Hawkins (1869).—**Charles K.**, tragedian, son of the preceding, was born in 1811 and educated at Eton. As a young man he acted along with his father. With scarce a tithe of the latter's genius, care and study made him a respectable actor. In 1842 he married Miss Ellen Tree, an accomplished Shakesperian actress. In 1850 he took the Princess's Theatre, where for several years he produced gorgeous and ta[illegible]akesperian revivals. He died January 22, 1868.

Keats, John, was born in London, October 29, 1795. Little promise of a poet could be found in him when a schoolboy; but the reading of the *Faerie Queene* burst the floodgates of his imagination, and the *Lines in Imitation of Spenser* are supposed to be his earliest attempt in verse. Removed from school, K. became for five years apprentice to a surgeon at Edmonton, and thence proceeded to London to follow his profession. But friendships formed with such men as Leigh Hunt, Hazlitt, Haydon, Godwin, Dilke, and Basil Montague soon drew him into the paths of literature. His first venture, a series of juvenile poems, passed unheeded by press or public. In 1818 he again produced a volume, containing *Endymion*, and a few smaller pieces. Although little general attention was at first called forth by these poems, their author was detected and attacked as a member of the Cockney school by the *Quarterly Review* and *Blackwood's Magazine*. The effect of this attack upon K. himself has been greatly exaggerated. While treating the critics with apparent contempt, he yet made use of the lesson so roughly taught, and in his last volume, *Tales and Poems*, containing, with shorter pieces, *Hyperion*, and the *Eve of Saint Agnes*, won for himself a foremost place in English poetry. Nothing richer in colour, daintier in phrase, or more delicious in melody exists in our literature than the *Ode to a Nightingale*, *On a Grecian Urn*, *To Autumn*, and the *Eve of Saint Agnes*. Byron thought the fragment of *Hyperion* as sublime as Æschylus. There is a sober gorgeousness in the diction that strikingly contrasts with the flowery and fantastic juvenilities of *Endymion*, and shows that the genius of K. was rapidly ripening to a splendid harvest. But the ravages of hereditary disease, hastened by an unfortunate passion, carried him off in the brightness of his youth. He died at Rome, 27th February 1820, and lies there in the Protestant cemetery, close by the grave of Shelley, whose *Elegy of Adonais* is the noblest tribute to a brother poet in English literature. The only complete edition of K.'s poems is that edited by Lord Houghton (Lond. Bell & Sons, 1877).

Keble, John, an English poet, son of the Rev. John K., was born at Fairford, Gloucestershire, April 25, 1792. He studied at Corpus Christi, Oxford, and after becoming a university tutor and examiner, devoted himself to the life of a parish priest. In 1827, he published *The Christian Year, or Thoughts in verse for the Sundays and Holydays throughout the Year*, which had a very great success. He became Professor of Poetry at Oxford in 1831, and was one of the chief movers in the 'Puseyite' movement, contributing to the famous *Tracts for the Times*. He received the living of Hursley in 1835, published *Lyra Innocentium* in 1846, *Sermons Academical and Occasional* in 1848, and wrote *A Life of Wilson, Bishop of Sodor and Man*, and several High Church pamphlets. He retained great influence in his party until his death at Bournemouth, March 29, 1865. K. holds a high place among English devotional poets, his verses breathing deep religious sentiment and genuine love of nature. See Shairp's *Studies in Poetry and Philosophy* (1868).

Keble College, Oxford, founded by subscription as a memorial to the late Rev. John Keble (q. v.), was incorporated by royal charter bearing date June 6, 1870, by which it is declared to be 'founded and constituted with the especial object and intent of providing persons desirous of academical education, and willing to live economically, with a college wherein sober living and high culture of the mind may be combined with Christian training, based upon the principles of the Church of England.' The college is governed by a warden and a council of not less than nine, nor more than twelve members. In 1876 it had five tutors, four lecturers, a precentor and a bursar, eleven scholars, five exhibitioners, three students of music, and 122 commoners. It presents to three livings. The buildings, of red brick, are from the design of Mr. W. Butterfield. The foundation-stone was laid April 25, 1860, and the dedication took place June 23, 1870. A splendid chapel has since been erected.

Kecskemét′ (*Egopolis*), a town of Hungary, in the county of Pesth, and in a sandy plain 54 miles S.E. of Pesth by rail. It has four large churches, important manufactures of soap, leather, and wheaten bread, and famous cattle, sheep, and horse markets. Pop. (1869) 41,195, of whom one-third are Protestants.

Kedge, a small anchor, employed to steady a vessel when riding in a tidal river, and to prevent her fouling the bower anchor, particularly at the turn of the tide. Among other purposes it is used to move a ship along in a harbour, the K. being carried out and let go from a boat. This operation is called *kedging* or *warping*.

Ke′dron (Heb. 'turbid') is a 'mountain ravine (not a 'brook,' as in the A. V.), in most places narrow, with precipitous banks of naked limestone,' although in places the easy slopes and bottom are capable of cultivation. It begins in a slight depression on the summit of the plateau 1¼ mile N.W. of Jerusalem. Running for about ½ mile towards the city it turns to the E., and holds that direction for about ¾ mile, at a distance of about ½ mile to the N. of the city. It then turns to the S. and widens; but is soon contracted again by the Mount of Olives on the E. and Bezetha on the W. Farther down, Moriah on the W. and Olives on the E. rise precipitously from a torrent bed. Below the point where it is joined by the Tyropœon (see JERUSALEM), K. again expands into a level fruitful tract, which extends to the mouth of Hinnom, where K. ends, at a distance from its head of about 2¾ miles.

Keel (Old Eng. *Ceol*, Dutch and Ger. *Kiel*), that part of a ship which extends along the bottom from stem to stern, and on which the whole superstructure is built. In wooden vessels the K. consists of several lengths of wood scarfed together end ways. Occasionally it is protected from injury by a strong piece of timber called a *false K.* *Bilge-keels* are fastened to the bottom of a ship parallel to the main K. to prevent heavy rolling or drifting to leeward, and with the same object *sliding keels*, pieces of wood or iron that may be lowered through the main K., are used. In iron ships the K. is usually formed of lengths of bar iron welded together.

Keel′age, dues levied on a ship entering a port or harbour.

Keel′hauling (Dutch *Kielhaalen*), a punishment, now obsolete, practised in the Dutch navy, and introduced into the English navy during the reign of William III. It consisted of dropping the delinquent, having weights to his feet, from a yard-arm and dragging him through the water under the keel to the other side of the vessel. Colloquially K. signifies a vexatious examination, or galling conduct of an official towards a subordinate.

Keel′son, or **Kel′son,** in shipbuilding, an internal keel placed directly over and securely fastened to the external keel. It serves to bind together the floor-timbers and gives increased strength to the ship. Pieces of timber or angle iron placed on each side of the K. are termed *sister keelsons*.

Keep (from Old Eng. *cépan*, 'to hold'), a stronghold constructed in the centre of a castle or fortress as a place of retreat for last defence, also called *Donjon* (q. v.).

Keeper of the Great Seal. See GREAT SEAL.

Keighly, a town of England, in the W. Riding of Yorkshire, on the Aire, 9½ miles N.W. of Bradford by rail. It is a busy centre of the worsted trade, producing yarns and fancy goods, and also manufacturing much paper, machinery, &c. Besides several good churches it has a free grammar school and a handsome mechanics institute, opened in 1870. Pop. (1870) 19,775.

Kei River, Great, forms the boundary between Cape Colony and Kaffraria. The country on its upper waters is level and fertile, but on the lower part of its course the land is wild and rugged, and unfit for cultivation. The mouth of the K. is blocked against vessels by an impassable bar.

Keiskamm'a, a river of Cape Colony, draining the S. and E. slopes of the Amatola mountains. It falls into the Indian Ocean in 33° 14′ S. lat., 27° 20′ E. long. Though a fine stream, it is useless for purposes of navigation.

Keith, the Family of, is no doubt a very ancient one, but the legends of its origin given in Buchan's *Ballads of the N.E. Coast* do not deserve attention. The hereditary office of Grand Marischal is said to have been given to a K. by Malcolm II. after a battle with the Danes. Sir Robert K. stood high in the confidence of Edward I., but afterwards joined Robert Bruce and received from him the lands of Buchan in Aberdeenshire, to which by a marriage with the Frasers the family added the Kincardineshire estates on which their castle of Dunottar was built. In 1458 Sir William was created *Earl* Marischal and Lord K. The fourth Earl, 'William of the Tower,' who took a leading part in the Reformation, was one of the wealthiest nobles of that time, having a rental of 270,000 merks and lands in Haddington, Linlithgow, Kincardine, Aberdeen, Banff, Elgin, and Caithness. The fifth Earl negotiated the marriage of James VI. and Anne of Denmark; founded and endowed Marischal College, Aberdeen (1593); granted its original charter to Peterhead; acted as lieutenant of the north in the time of the Spanish Plot; and was royal commissioner in the Scottish Parliament of 1607. At the Union (1707) another earl protested that it should not prejudice the rights of Great Marischal, which the family had held for 700 years. His sons **George, Earl Marischal** and **James K.** are both famous in history. The former was captain of the guard under Queen Anne, and on her death, although a Protestant, he was strongly urged to proclaim James Stuart at Charing Cross. He waited for the rising of 1715, when he defeated one portion of Argyle's army at Sheriffmuir and received the Pretender at Newburgh and Fetteresso. Both brothers had to leave Scotland. After some years of intrigue with Carl XII. and Alberoni, they reappeared in the Hebrides in concert with the Ormond Expedition, but were defeated at Glenshiel by Wightman (1719). For several years the Earl acted as confidential political agent for the Pretender and the Chevalier at the courts of Spain and France, but he took no part in the '45. He seems to have quarrelled with the Stuarts and then entered the diplomatic service of Friedrich the Great, just as Tyrconnel entered the diplomatic service of France. As Governor of Neuchâtel, he became extremely intimate with Rousseau, who, in his *Confessions*, describes 'this illustrious and virtuous Scotchman.' In 1759 Lord Chatham got the sentence of attainder reversed, and the earl returned to Scotland, taking the oath of allegiance in the Court of King's Bench, and inheriting the Earldom of Kintore. He was said to have furnished to the English Government some valuable information regarding the Bourbon Family 'compact.' Finding his old house of Inverugie destroyed, he returned to Berlin, where Friedrich gave him a house near the Sans Souci Gardens, and where he died 28th May 1778. He adopted a Turkish girl, whom, when a baby, his brother had rescued at Oczakow. Carlyle calls him 'a cheery old soul, honest as the sunlight, with a fine small vein of gaiety.' **James K.**, the younger brother, after serving in the Irish Brigade and in the Spanish expedition to Gibraltar, entered the military service of Russia and distinguished himself under Münnich against the Turks at Oczakow (1737), and under Lacy against the Swedish Wrangel at Wilmanstrand (1741). He set his face against the habitual cruelty of the Russian army. He was at London in 1740, and assisted in carrying out the Peace of Abo against the rebellious Dalecarlians in 1743. A young Prince Repnin having been unjustly preferred to a command in 1747, K. left the service of Elizabeth for that of Friedrich the Great, who at once made him field marshal with an income of £1200. 'The sagacious gentleman with the broad accent' became a great favourite, not only in military but in literary matters. After brilliant exploits in the Seven Years' War, at Prag, Rossbach, and Olmutz, K. was shot dead in the battle of Hochkirk (1758). He was buried in the Garnison Kirche there, the inscription over his grave being written by Metastasio, and statues by Tassaert to him and to his companions Schwerin, Winterfield, and Seidlitz were erected on the Wilhelm Platz at Berlin. Quite lately, the German Emperor sent a bronze statue of K. to Peterhead. Like his brother, K., who was educated by Bishop Keith, wrote well. He has left an autobiography, an account of the Prussian Court, and letters about Russia. The best life was published 1844. See also *Correspondence of Sir Robert* ... Theresa, in (Lond. 1749). The latter was a diplomatist of some ... acted as in 1771 brought Matilda, the divorced Queen of Denmark, sister of George III., to Hanover.

Kelat', the capital of the state of Beluchistan on the frontier of India, 392 miles N. of Kurrachee and 22... Jacobabad; with these two towns, which are both in Scinde, it is connected by tolerable roads. K. occupies an important position, at the upper end of the Bolan pass, both for military and commercial purposes. It was occupied by the British during the Afghan War; and the most important diplomatic event in recent Indian history is the K. treaty of 1877, by which the Khan receives an annual subsidy of £10,000, and a British Agent resides at his court with a strong military escort of all arms. A line of telegraph has been already laid down, and it is proposed to construct a railway. In fact, the mediatization of K. has been carried into execution so as to outflank a possible enemy in Afghanistan.

Kell'ermann, François Christophe, Duc de Valmy, a Marshal of France, was born near Strassburg, May 30, 1735. He entered the army when seventeen, served in the Seven Years' War, and later in Russia. Embracing the Revolution, as commander on the Moselle in 1792 he gained the decisive victory of Valmy, which drove the Prussians out of France. In 1793 he was general of the army of the Alps. Under Napoleon he was a commander of reserves. After Elba he supported the Bourbons. K. died September 12, 1820. From the *Mémoires* he left, his son wrote a *Histoire de la Campagne de* 1800 (Par. 1854).

Kells, an ancient town of Ireland, in the county of Meath, Leinster, on the Blackwater, 39 miles N.W. of Dublin by rail. It has an old church and round tower, a handsome Roman Catholic church, a fever hospital, some lace industry, six great yearly fairs, and a considerable retail trade. Pop. (1870) 2953. K., in Irish Gael. *Ceanannus* ('head abode'), was a royal residence down to the 6th c., 'when King Dermot MacKerval granted it to St. Columkille, after which time it lost its pagan associations, and soon became a great ecclesiastical centre.' See Joyce's *Irish Names of Places*, 2d series (Dub. 1875). Ceanannus was shortened into *Kenlis*, and that into K. The town gave title to a bishop, was plundered by the Danes in the 12th c., became a stronghold of the English Pale, and sent two members to the Irish Parliament previous to the Act of Union.

THE END OF VOL. III.
